M.S. Feld, Massachusetts Inst. of Technology, School of Science, Dept. of Physics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (PHY78-18120)

This research in atomic physics will study certain aspects of superradiance which is a fundamental effect involving the coherent spontaneous emission of light by a collection of atoms or molecules. The program will include the study of superradiance by two new methods: (1) creation of a fully inverted (pi) initial state by adiabatic inversion of an optically-thick sample and (2) preparation of an optically-thick system in a pi/2 configuration by suddenly terminating a resonant saturating field. The research will also study basic features of superradiant emission and explore theoretical predictions using these new techniques of producing superradiant radiation, as well as now standard optical pumping methods.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0026, INVESTIGATION OF TOPICS IN OPTICAL ELECTRONICS AND GENERATION OF FAR-IR RADIATION 16225-P

A. Javan, Massachusetts Inst. of Technology, School of Science, Dept. of Physics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DA0G9032; DAAG29-79-C-0028)

(1) To study the fundamental physics of high speed metal-barrier-metal junctions and their application to optical electronics. (2) To search for novel approaches and perform experiments that will lead to generation of intense coherent radiation in the FIR and millimeter wave regions. Relevance - tunneling junctions are of fundamental importance to the detection and production of electromagnetic radiation. This directly impacts Army systems in the MW, FIR, and IR spectral regions. The fabriction techniques raise the possibility of the manufacture to sophisticated IR systems at low cost. The FIR generation work bears directly on the Army's NMMW thrust.

To deposit junctions of very small size and controlled barrier thickness in the visible, IR, FIR, MW, and RF spectral regions in order to observe their response as a function of applied bias. The ultimate goal is to extend microelectronic techniques into the optical spectral region. For the production of FIR radiation, they will consider rotational nonequilibrium, low-lying vibrational states, excitation by slow electrons and impurity levels in semi-conductors.

8.0027, ATMOSPHERE EXPLORER, DYNAMICS EXPLORER, AND SAN MARCO DATA SOFTWARE DEVELOPMENT

G.R. Carignan, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Electrical Engineering, *Ann Arbor, Michigan* 48104 (NAS 5-25916)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Goddard Space Flight Center

8.0028, QUANTUM DYNAMICS OF MOLECULAR INTERACTIONS

W.R. Gentry, University of Minnesota, Minneapolis Campus, School of Liberal Arts, Dept. of Physics & Astronomy, *322 Johnston Hall, Minneapolis, Minnesota* 55455 (CHE79-08346)

This research is in the area of quantum chemistry; it involves molecular beam scattering. Drs. Gentry and Giese intend to continue pulsed molecular beam measurements of differential cross-sections for state-resolved rotational transitions in atom-diatom and diatom-diatom collisions, and to extend this research to the study of vibrational-rotational energy transfer processes. Taking advantage of the unique capabilities offered by the combination of a pulsed molecular beam and a pulsed laser, they also plan to study bimolecular reactive collisions of excited molecules, and the dynamics of unimolecular fragmentation following vibrational or electronic excitation under collision-free conditions. This research represents a continuation of that currently supported by Foundation grant CHE7611368.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

8.0029, SURVEILLANCE - DISSOCIATIVE CHARGE TRANSFER EXCITATION

J.J. Leventhal, University of Missouri, St. Louis Campus, School of Arts & Sciences, Dept. of Physics, *8001 Natural Bridge Rd., St. Louis, Missouri* 63121 (DN675483; N00014-76-C-0760)

Charge transfer processes occur in many gaseous lasers, in the ionosphere, and plasmas. Radiative charge transfer is an important means of producing population inversion in metal vapors. Thus, it is important to the naval areas of communications and surveillance to obtain a better understanding of the mechanisms involved in charge transfer excitation of metal vapors which have potential laser application.

The present apparatus is being modified so that VUV and soft x-rays can be observed. Then collisions of He (2 plus) with Li will be studied. It has been predicted theoretically that this should lead to a selective population of the He-plus (31) states. Collisions between other low Z ions and Li will also be studied if time permits.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0030, STUDY OF GEOLOGICAL MATERIALS BY THE METHODS OF PARTICLE TRACKS, THERMOLUMINESCENCE AND RARE GASES

R.M. Walker, Washington University, School of Arts & Sciences, Dept. of Physics, *4559 Scott Ave., St. Louis, Missouri* 63130 (EAR7822440)

This is a continuation of research supported under NSF grant EAR76-22697 and A01.

A continuing search for superheavy elements is proposed using low-level spontaneous fission counting experiments on plastic track detectors. The samples to be used in these experiments will be separated fractions of the Allende meteorite and hot springs extracts obtained from Russia. The anomalous fission events in these samples may indicate the presence of superheavy elements.

The discovery of large numbers of meteorites in Antarctica opens up an exciting new chapter in meteoritics. These meteorites give the first opportunity to look at the behavior of cosmic rays at discrete intervals of time in the past. Also these meteorites make it possible to determine if the nature of the meteorite flux hitting the earth has changed in time. The time factors in various age determinations will be measured using the radiation damage (fossil track technique in films) and measurements of radioisotopes such as 26Al and 53Mn, etc.

Thermoluminescence measurements will be made routinely as a method of measuring terrestrial ages and delineating those meteorites with unusual orbital elements.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Earth Sciences

8.0031, SUPERCONDUCTIVITY IN FILAMENTARY EUTECTIC COMPOSITES

M.P. Zaitlin, Dartmouth College, School of Arts & Sciences, Dept. of Physics & Astronomy, *P.O. Box 833, Hanover, New Hampshire* 03755 (ER-78-S-02-4938)

High quality filamentary eutectic composites of Nb-Th and Nb-Y have recently been developed by Prof. J.D. Verhoeven at the Ames Research Laboratory. These materials consist of very small (i.e. approximately 100A) diameter superconducting filaments embedded in a normal metal matrix. Measurements of the thermal and electrical conductivity of these materials will be made near the superconducting transition temperature to observe the effects of thermodynamic fluctuations. Josephson coupling between filaments is expected to play an important role in the superconducting properties of these materials. This coupling can be varied by changing the distance between filaments which can be done by drawing down the wire or using different normal metal matrix materials. If necessary, the normal metal may be etched away at several points along the wire to eliminate the coupling. The fluctuation conductivity will be studied as a function of filament spacing.

This coupling is also expected to produce a crossover from one-dimensional to three-dimensional superconductivity which could be detected in the electrical conductivity near Tc. Evidence for such a crossover has been observed in granular films but the relevant physical parameters are better characterized and easier to adjust in a filamentary eutectic.

SUPPORTED BY U.S. Dept. of Energy, Div. of Basic Energy Sciences

8.0032, HYPERFINE INTERACTIONS AND ELECTRONIC STRUCTURE BY MOSSBAUER/CONVERSION ELECTRON SPECTROSCOPY

N. Koller, Rutgers the State University of New Jersey, New Brunswick Campus, School of Arts & Sciences, Dept. of Physics, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (DMR79-00816)

The microscopic origins of the hyperfine interactions at nuclei in magnetic environments will be investigated using a high transmission, high resolution electron spectrometer. This spectrometer will detect conversion electrons resulting from Mossbauer transitions in isotopes of iron and tin. These experiments make possible the direct measurement of the charge and spin density of the electrons at the nuclear site and provide a sensitive test of electronic wave function calculations. It will also be possible to measure the effect of the chemical environment in various materials. This research previously supported under DMR 7602053 AO2. This is the first of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0033, SPIN ALIGNED ELECTRONS IN SEMICONDUCTORS

R.R. Alfano, City University of New York, City College, School of Arts & Sciences, Dept. of Physics, *Convent Ave. & 138th St., New York, New York* 10031 (DMR7817805)

Picosecond time resolved spectroscopy will be used to study the dynamics of optically spin aligned electrons in semiconductors. The interactions among and between spin aligned electrons and plasmons will be investigated. The spin dephasing time will be measured as a function of temperature, photon energy of the exciting light pulse, and carried density of P-type and N-type semiconductors. The effect of intervalley and intravalley scattering processes on the spin alignment will be investigated by measuring the transient development of the distribution function of the photo-generated electrons and holes. The polarization kinetics of the 'hot' photoluminescence spectrum will be studied to obtain information on the energy, momentum and spin-relaxation of the electrons in gallium arsenide and other III-V and II-IV semiconductors. This program will provide fundamental insight into the underlying mechanisms for the relaxation of optical spin aligned electrons in semiconductors.

This is the first year of a three-year continuing grant.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0035, THEORETICAL RESEARCH IN CONDENSED MATTER PHYSICS
V. Ambegaokar, Cornell University, Ithaca Campus, School of Arts & Sciences, Dept. of Physics, *Ithaca, New York* 14850 (DMR77-18329)

This research was previously supported under grant DMR-7423494.

Theoretical research will be carried-out on a wide range of topics in condensed matter theory. Among the problems which will be considered are: (1) Non-equilibrium effects in superconductors. (2) Chemical kinetics. (3) Superfluidity of liquid 3He. (4) Dense conducting fluids, especially their behavior near the liquid-vapor transition; (5) optical properties of metallic systems, including generalizations to electron energy loss phenomena. (6) Photoemission, including an attempt to understand the microscopic fields near surfaces and how they may bear on the interpretation of angle integrated and angle resolved photoemission. (7) Zero temperature freezing and melting of Bose and Fermi systems. (8) Exact simulations of bulk helium four in both solid and liquid phases. (9) Surface and bulk singularities in the A-phase of 3He, their topological necessity and their bearing on the stability of superflow. (10) Local moment/valence fluctuation systems. (11) Transport processes across a liquid 3He-solid interface. (12) Low-temperature properties of solid bcc 3He.

8.0037, GENERAL RELATIVITY
P.G. Bergmann, Syracuse University, School of Arts & Sciences, Dept. of Physics, *Hall of Languages, Syracuse, New York* 13210 (PHY79-08887)

Research in theoretical gravitational physics initiated under NSF grant PHY78-06721 will be continued. Among the topics to be investigated are: A. Classical Relativity Theory - 1. Uncertain relations between electric and magnetic components of the Riemann tensor; 2. the definitions of multipole structure in the non-linearized theory. B. Quantization and Alternative Theories - 1. Phase integral quantization as a preliminary approach to quantization of the gravitational field; 2. the canonical quantization of general relativity by realizing the constraints as non-Hermitian operators; 3. supergravity with and without Grassman elements; 4. deformed twistor spaces in which self-dual gauge fields or H-spaces have been encoded to understand their role in the quantization of these fields.

This is the first year of a two-year continuing grant.

Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0038, MOSSBAUER SURFACE STUDIES
R.W. Hoffman, Case Western Reserve University, Graduate School, Dept. of Physics, *2040 Adelbert Rd., Cleveland, Ohio* 44106 (DMR79-09078)

Free surfaces of solids, particularly nickel, will be studied by in-situ Mossbauer Effect Emission Spectroscopy (MEES) combined with other surface analytical techniques. MEES is an extremely sensitive technique, requiring only 10 to the 14th power radioactive cobalt-57 atoms cm to the negative 2nd power to provide measurable values of conduction electron density, electric field gradients and hyperfine fields at the nucleus. Combining low-temperature cobalt-57 deposition with clean surfaces gives quantitative free surface information not obtainable by other techniques. The MEES technique will be used to measure the surface magnetization and surface anisotropy of ferromagnetic crystals, surface Debye tempratures, surface site identification, and charge transfer at free and overlayered surfaces. Results will allow distinction between the theories for surface magnetism and provide a well-chracterized basis for some steric systems.

This research previously supported by DMR 7710640.

8.0039, RADIATION-INDUCED VOIDS BY POSITRON ANNIHILATION
J.D. McGervey, Case Western Reserve University, Graduate School, Dept. of Physics, *2040 Adelbert Rd., Cleveland, Ohio* 44106 (DMR79-06726)

Radiation-induced voids and other defects in aluminum, aluminum alloys and other materials will be studied by measuring positron lifetimes and the angular correlation of positron annihilation radiation. Samples will be irradiated at the Oak Ridge National Laboratory Reactor, and the new National Center for Small-Angle Scattering Research will be used to test the samples and compare results with the positron results. Quenched samples will also be studied to further clarify the nature of the defects by comparing the annealing behavior in the various samples. This comparison will clarify the role of impurities in the formation of voids and other defects, because transmutation-produced silicon and helium are present in irradiated aluminum. Aluminum-silicon and aluminum-magnesium alloys will be investigated by performing direct equilibrium measurements of binding energies between vacancies and impurity atoms, using an improved technique to eliminate uncertainties in previous measurements.

Research previously supported by DMR 7407190 AO1.

8.0040, ION PHOTODISSOCIATION AND PHOTOFRAGMENT SPECTROSCOPY
J.T. Moseley, Oregon State Higher Education System, University of Oregon, School of Arts & Sciences, Dept. of Physics, *Johnson Hall, Eugene, Oregon* 97403 (CHE79-18074)

This resarch is in the area of quantum chemistry. Various techniques of ion photofragment spectroscopy will be used to investigate the potential surfaces, structural properties, and dissociations of molecular ions. These techniques yield spectroscopic information on gas-phase ions, uniquely detailed measurements on the evolution of near-threshold dissociation, accurate potential curves for diatomic ions, and lifetimes of predissociat-

ed states. Measurements will be extended to polyatomic ions such as O3 ion, O3-, CO3-, CH3I ion, H2O ion, CH2 ion, and N2O ion and to shorter wavelengths, using newly developed lasers. New techniques of fast ion spectroscopy will also be developed and applied to these ions. The techniques to be used allow measurements to be made with nearly Doppler-free resolution and permit the energy and angular distributions of photofragment ions to be determined. In some cases, all relevant quantum numbers involved in the transition can be specified, leading to the possibility of very detailed comparison with theoretical calculations. Cooperative research with the French group at Orsay will involve the measurement of high resolution kinetic energy distributions and of branching ratios in predissociation, investigation of the superposition of states in dissociation, and analysis and interpretation of experimental measurements relating to these problems. This resarch represents a continuation of that currently supported at SRI International by Foundation grant CHE7700428.

8.0045, ATOMIC COLLISIONS AND PLASMA PHYSICS 16723-P

M.A. Biondi, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (DA0G9009; DAAG29-79-C-0043)

To study atomic collisions related to the upper atmosphere. Relevance - this research provides basic information for ballistic missile defense systems, and has the potential for contributing parameters for studies of laser propagation in the atmosphere.

Experimental investigations of ion-molecule reactions and electron-ion recombination under conditions, and for species, of interest to DNA.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

8.0046, PICOSECOND SPECTROSCOPY APPLIED TO THE STUDY OF SEMICONDUCTOR INTERFACES

H.J. Gerritsen, Brown University, Graduate School, Dept. of Physics, *University Hall, Box 1883, Providence, Rhode Island* 02912 (DMR79-09701)

Picosecond optical techniques will be applied to the study of excess carrier recombination at semiconductor interfaces. Of specific interest are group III-V semiconductors with bare surfaces, insulated interfaces, and heterojunctions. The novel experimental technique is based on the excitation of a region near an interface in a semiconductor by absorption of an ultrashort light pulse followed by a real-time measurement of the subsequent decay by time delayed ultrashort probe pulses. Specific information about the character of interface states as traps and recombination centers for electrons and holes will be obtained. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0047, HIGH RESOLUTION LASER SPECTROSCOPY

R.F. Curl, Rice University, School of Natural Sciences, Dept. of Chemistry, *6100 Main, Houston, Texas* 77001 (CHE78-26572)

This research is in the area of quantum chemistry. Drs. Curl and Tittel intend to continue a program of research in three areas of laser spectroscopy and in corresponding areas of laser development. The three areas are visible dye laser studies of reactive small molecules, microwave optical double resonance studies of Van der Waals molecules in a supersonic jet (near UV region using doubled CW dye lasers), and Zeeman modulated intracavity absorption near infrared studies of the X-H stretch (X equals N,O,C) of the small free radicals NH2, HO2, CH2, CH3, and CH using a color center laser. In the visible dye laser region the development of a new optical-optical double resonance technique for studying nuclear hyperfine structure employing two CW single mode dye lasers frequency stabilized with respect to each other is planned. The application of this technique and of saturation spectroscopy to sorting out part of the perturbation mixing of the ground state with the excited state in NH and laser spectroscopy studies of BH2, BS, CS ion, and HCO are planned. Observation of microwave frequency rotational transitions using microwave optical double resonance of the He-pyrimidine complexes formed by supersonic nozzle expansion is to be carried out. The absorption spectra of small free radicals will be studied using Zeeman modulation by formation of the radicals in a flowing gas system inside the laser cavity. Finally, it is planned to use color center lasers to study the X-H stretch of hydride free radicals such as NH2, HO2,

CH3, CH2, and CH. This research represents a continuation of that currently supported by Foundation grant CHE7606103.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

8.0048, SPIN DEPENDENCE OF ION-ATOM COLLISIONS AND HYPERFINE STRUCTURE OF SIMPLE IONS BY REORIENTATION SPECTROSCOPY OF STORED IONS

H.A. Schuessler, Texas A & M University, College Station Campus, School of Science, Dept. of Physics, *College Station, Texas* 77843 (PHY79-09099)

This research project studies the details of ion-atom and ion-molecule reactions by suspending a number of ions in a specific orientation in an electromagnetic field for many minutes, and bombarding them with a similarly well-defined beam of atoms or molecules. The results show the effects of isolated quantum-mechanical effects, and can be compared directly with theory. The study of simple systems, such as collisions between noble gas ions, and polarized alkali atoms, is emphasized. Molecular alignment by the dynamics of photodissociation will be studied. The spin dependent collisions are then used to measure fundamental atomic properties by reorientation spectroscopy. The magnetic moments of the electron, bound in the simplest atom, 4He ion (no hfs) and of the simplest molecule, H2 ion and measured to test basic relativistic and radiative contributions to the atomic structure. Hyperfine structure splittings of H2 ion and of its istopic variants will be investigated to test ab initio molecular theories. Certain aspects of the experiments are relevant to plasma in controlled thermonuclear reactions. The charge transfer reactions are possible mechanisms for lasers in the far ultraviolet region. Reactions involving molecular hydrogen and molecular hydrogen ions are important processes in steller atomospheres.

This research is a continuation of that previously supported under NSF grant PHY76-81827A01.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0049, STRUCTURE AND BONDING IN AMORPHOUS AND QUASI-AMORPHOUS SOLIDS

S.C. Moss, University of Houston, School of Natural Sciences & Mathematics, Dept. of Physics, *3801 Cullen Blvd., Houston, Texas* 77004 (E-578)

Work has been concentrated on the application of X-ray absorption spectroscopy to the attachment and association of alkali ions to various molecular constituents. In particular both EXAFS and near-edge spectroscopy have been performed on the potassium K edge to denote differences in bonding among the simple hydrated state, the crystalline state in salts and cryptates and the associated state in various complexes in solution. It has been shown (in collaboration with H. Huang of Rice University) that potassium is not 'free,' as in aqueous solutions, in frog blood cells. Work continues on an analysis of the extended edge fine structure (EXAFS) in many of these materials.

In another area of disordered solids, a careful measurement of the lattice parameters of pure Pb and a Pb-0.0918 percent Au sample shows that Au in both monomer and tetramer defect states produces lattice contraction with the tetramer somewhat remarkably having the larger effect per atom. The observed monomer contraction suggests that the majority site occupancy for Au is substitutional and that the rapid Au diffusion must therefore involve a substitutional-interstitial mechanism.

8.0050, STUDY OF GRAVITATIONAL THEORY AND GENERAL RELATIVITY

R.A. Matzner, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (INT78-22553)

Physicists from the Center for Relativity at the University of Texas at Austin will be collaborating with counterparts at the Center for Nuclear Studies of the National Autonomous University of Mexico. These scientists will be working toward elaboration of mathematical models of general relativity in which solutions of the equations differ in some important details from the Einstein model. Favorable results would lead to important developments in our understanding of stellar phenomena and the cosmos.

SUPPORTED BY U.S. National Science Foundation, Directorate for Scientific Technological & Internat. Affairs, Div. of International Programs

8.0051, COOPERATIVE OBSERVATIONS OF OPTICAL EMISSIONS DUE TO ENERGETIC NEUTRAL ATOM PRECIPITATION (THE EQUATORIAL AURORA)

B.A. Kinsley, University of Texas, Dallas Campus, Graduate School, *Richardson, Texas* 75080 (INT79-03438)

Professor B.A. Tinsley of the University of Texas at Dallas and Dr. Y. Sahai and Dr. N. Teixeira of Brazil's Institute of Space Studies will study optical emissions from the equatorial upper atmosphere. Such emissions have been observed from satellites and Dr. Tinsley has performed theoretical analysis of the emission effect. Analysis of the relative intensities and time variations of the emissions from hydrogen, helium, oxygen and nitrogen will give information on the time variation of ionic composition and energy distributions of ions in the atmosphere's ring current. The observation site near Sao Jose dos Campos, Brazil is at the optimum latitude for observation of the energetic particle effects. Existing equipment will be modified and tested in the U.S. and then shipped to the Cachoeira Paulista site between Sao Paulo and Rio de Janerio.

8.0053, STORED ION SPECTROSCOPY FREQUENCY STANDARD

D.J. Larson, University of Virginia, School of Arts & Sciences, Dept. of Physics, *Garrett Hall, Charlottesville, Virginia* 22903 (DN775566; N00014-78-C-0772)

Stored ion spectroscopy may provide a means of improving and simplifying highly accurate timing devices. Accurate timing is of interest to the Navy through improved positioning and missile accuracy. It may also be of importance in the areas of rapid transmission of digital data and long base line interferometry.

The microwave spectrum of S(minus), i.e., the fine structure transitions, is now being studied. The apparatus is being redesigned so that the S(minus) is produced by dissociative detachment from a pulsed beam of OCS rather than from a background gas of OCS since the latter reacts with S(minus) to form S(2)(minus). The photodetachment of S(2)(minus) is also being studied.

8.0055, GRAVITY, QUANTIZED FIELDS, AND RELATIVISTIC ASTROPHYSICS

L. Parker, University of Wisconsin, Milwaukee Campus, School of Letters & Science, Dept. of Physics, *Pearse Hall, Room 107, Milwaukee, Wisconsin* 53201 (PHY77-07111)

Research initiated under NSF Grant PHY72-05161 A02 will be continued. In addition to the areas of research under the previous grant, new topics in relativistic astrophysics will be investigated. John Friedman, who has recently joined the university as an Assistant Professor, is included in the present project as co-investigator.

Research under way on vacuum polarization and particle creation by strong gravitational fields will continue. Work on the quantum treatment of the damping of expansion anisotrophy in the early universe will be generalized and extended. A new type of infrared divergence occurring for quantized gravitational and scalar fields will be investigated. Other topics in quantum field theory on curved backgrounds will also be studied.

Research on the analogue for curved space-time of the Dirac charge quantization condition will be continued. A related area of research involves quantizing test electromagnetic fields on curved space-times with non-trivial topologies. The possible existence of spinor fields acted on by the group of diffeomorphisms on a space-time will also be investigated.

In recent work, John Friedman showed that all rotating Newtonian stars are unstable or marginally unstable to gravitational radiation; a key aim of his current research is to establish analogous results in general relativity.

10.0001, SUPPORT FOR ASTRONOMICAL RESEARCH AT STEWARD OBSERVATORY OF THE UNIVERSITY OF ARIZONA

P.A. Strittmatter, University of Arizona, Steward Observatory, *Tucson, Arizona* 85721 (AST78-25539)

Support will be provided for personnel to maintain, improve and operate equipment necessary for the scientific programs at the Steward Observatory of the University of Arizona. The growing complexity and sophistication of modern astronomical instrumentation has placed increasing demands on observatory personnel. Such personnel are required for operation of the telescope and for data acquisition and reduction. The main observational facilities of the Steward Observatory are the 90-inch, 36-inch, and 20-inch telescopes. The 90-inch is a general purpose telescope equipped with a wide range of instruments; the 36-inch telescope has been committed to a near-infrared sky survey. Instrumentation on the 90-inch telescope includes a Boller and Chivens spectrograph, a cassegrain echelle spectrograph, and a Fourier transform spectrometer.

10.0006, THEORETICAL STUDIES OF THE INTERSTELLAR MEDIUM

M.A. Jura, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Astronomy, *405 Hilgard Ave., Los Angeles, California* 90024 (AST78-22676)

Theoretical investigations of physical processes in the interestellar medium will be carried out. Specific goals of this program are: (1) an elucidation of the formation mechanism of interstellar CH ion; (2) an improved determination of the ultraviolet albedo and phase function of interstellar grains; (3) a construction of models for scattering by dust grains to explain the observed optical polarization in external spiral galaxies. Achievment of these goals would substantially advance our knowledge of the interstellar medium and therefore lead to a better understanding of star formation and the evolution of galaxies.

10.0007, STELLAR PROPER MOTIONS AND PARALLAXES

A.R. Klemola, University of California, Santa Cruz Campus, Lick Observatory, Dept. of Astronomy & Astrophysics, *Mount Hamilton, California* 95140 (AST79-09098)

Astrometry is the field of astronomy concerned with the measurements of position and motions of celestial objects. This work is fundamental to all branches of astronomy, although perhaps not the most glamorous, particularly since it is necessary to pursue the measurements over long time base-lines. This project utilizes the distant galaxies as the fundamental reference system, thus providing a true inertial system. The first epoch photographic plates were obtained in the period 1947 through 1954. This project will obtain the second epoch plates. Since 1971, the start of this project, about 70 percent of the 1246 fields observable from Mt. Hamilton, California have been obtained and half of these measured. The phase of the project represented by this grant will continue this work. The specific goals of the analyses to be carried-out are: 1. Study of the general galactic rotation and possible deviations from a smooth pattern; 2. Study of the solar motion with respect to the nearby stars and determination of local systematic corrections to the fundamental system of coordinates as defined by the basic modern catalog AGK3 for the northern sky. Other projects which may be done include the measurement of distances of selected nearby stars and the positions and motions of objects of high immediate interest, such as comets, minor planets, and selected stars.

Prior support was by NSF AST 78-14276.

10.0009, STELLAR PARALLAXES AND PROPER MOTION

W.F. VanAltena, Yale University, Graduate School, Dept. of Astronomy, *206 Elm, New Haven, Connecticut* 06520 (AST76-81339 A02)

A program of astrometric research, with increasing emphasis on southern hemisphere coverage, will be continued. The determination of stellar parallaxes and proper motions by astrometric methods furnishes basic data important to other areas of astronomy. A star's distance from parallax measures permits finding the true brightness of the star and its position in space. The motions, from a comparison of stellar positions made with an interval of several years between observations, help to determine the sun's path among the stars and its position within our galaxy. The yardstick for all cosmic distances ultimately depends on these astrometric researches.

Over the next years the Yale investigators will work to reduce the deficiency of astrometric observations in the southern skies. Completion of the Yale Southern Proper Motion Program first epoch observations in Argentina, and an extension of the overlap with the Lick Observatory Northern Program, will be given top priority. Stellar parallax determinations, in part from early Yale observations in South Africa, will be continued. Membership determinations in southern star clusters from proper motion studies will be undertaken with the Yale astrometric telescope at Cerro Tololo Inter-American Observatory in Chile. A continuing effort will be made towards improving astrometric instrumentation and deriving all relevant positional information from photographic images to better utilize existing and future plate material.

Prior support was by NSF grant AST76-81339 A01.

10.0010, RESEARCH WITH A PHOTON-COUNTING IMAGE INTENSIFIER SPECTROMETER AT THE LAS CAMPANAS OBSERVATORY

L. Searle, Carnegie Inst. of Washington, *1530 P St. N.W., Washington, District of Columbia* 20005 (AST76-20839 A02)

The 2.5 meter DuPont telescope at the Las Campanas Observatory has now gone into operation. It will be equipped with a large Cassegrain spectrograph, a television system for acquisition of faint objects, and a photon-counting image intensifier detector system. This system will be upgraded to the point where it may be used routinely for observational programs by all staff members.

The first program to be done is an investigation of the stellar content of star clusters in the Magellanic clouds in order to determine the distribution of the age and chemical composition of these subsystems and to assess their significance to the chemical and dynamical evolution of galaxies. The second program is a radial velocity survey of galaxies brighter than sixteenth magnitude in the Zwicky catalog in order to investigate the structure of galaxy clustering in velocity space and to map the extent of the perturbation of the velocity field around rich clusters of galaxies.

This is a supplement to work previously supported under NSF grant AST 76-20839A01.

10.0011, RESEARCH ON SOLAR CORONAL ACTIVITY

M.K. McCabe, University of Hawaii System, Manoa Campus, Inst. for Astronomy, *2840 Kolowala St., Honolulu, Hawaii* 96822 (ATM76-10323 A02)

This grant will continue support of research on solar coronal activity at the University of Hawaii. This support has permitted the development of a technique for deriving whole sun infrared maps in the spectral line Me I 10830 that show coronal holes clearly. With this technique it is possible to obtain detailed time-series observations of structure, velocity and brightness fluctuations in the photosphere and chromosphere underlying holes, quiet regions and active regions.

The research objective of this grant is to use the 10830 maps to study the morphology and evolution of holes and other large-scale solar features. A further objective is to make a detailed study of the fine structure, velocity and brightness fluctuations, and the systematic velocity fields underlying holes, quiet regions and active regions at the photospheric and chromospheric levels. A major aim of this work is to understand the deposition of wave energy and momentum in coronal holes as contrasted with quiet and active regions. These observations will be used to develop improved methods for detecting holes using ground-based chromospheric observations.

10.0013, DYNAMICAL INVESTIGATIONS OF GALACTIC STRUCTURE PROBLEMS

R.H. Miller, University of Chicago, School of Physical Sciences, Dept. of Astronomy, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (AST76-14289)

A theoretical study to simulate by computer the processes that cause disk galaxies to take the shapes they do and how they can maintain those shapes as long as they must will be carried-out. Disk galaxies include barred and normal spirals, strongly flattened SO's, ellipticals, and ring galaxies. Numerical experimentation with simulated disk galaxies is the best way at present to investigate a variety of important problems in galactic dynamics. The physical stability of spiral galaxies is not understood. The velocity dispersions required for stable models are much greater than observed in our galaxy in the solar neighborhood. The problems of how our galaxy can be stable, or if it is stable, of how it can support a spiral pattern will be considered.

The computer simlations of the dynamics will be made into motion pictures to display the problems of galactic structure.

The motion pictures and other graphical displays will help both scientists and the public understand the problems.

10.0014, THEORY OF PULSAR ATMOSPHERES

E.A. Jackson, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Physics, *207 Engineering Hall, Urbana, Illinois* 61801

One of the exciting discoveries in astronomy during the past decade has been the existence of roughly 150 pulsars, which are stars which exhibit rapid, large-scale, periodic oscillations in their radiation. The pulsars are believed to be very dense (neutron) stars which have an intense magnetic field that rotates with the star. Associated with such a rotating field is a large electric field which can accelerate charged particles to high energies, producing the observed periodic radiation by a 'Lighthouse' effect. To confirm the neutron star hypothesis and explain the variety of observations, a theory is required for the plasma (ionized gas) atmosphere about such a star. This new type of stellar atmosphere, which is quite different than, for example, the sun's, can also occur in many other rotation magnetic stars which are not pulsars, and therefore may have much wider implications.

10.0015, VERY LONG BASELINE INTERFEROMETRY AT NORTH LIBERTY RADIO OBSERVATORY

R.L. Mutel, University of Iowa, School of Liberal Arts, Dept. of Physics & Astronomy, *Jessup Hall, Iowa City, Iowa* 52240 (AST79-10128)

A research program to conduct very long baseline interferometry (VLBI) experiments using the 18.3 meter radio telescope at the North Liberty Radio Observatory (NLRO) near Iowa City, Iowa, will be carried-out. The NLRO telescope constitutes one part of the VLBI Network, a national consortium of radio observatories conducting joint experiments at regular scheduled intervals. The Observatory's central geographic location and full-sky coverage ability make it an important addition to the Network by providing improved coverage of intermediate angular resolutions. Research projects at the University of Iowa which will benefit from the use of NLRO are the high resolution studies of hydroxyl masers surrounding stars and compact structure in extragalactic radio sources. The research on stellar OH masers will include VLBI maps of main radio spectral line emission from several supergiant stars, a determination of the relative position of the main line versus 1612 MHz spectral line masers in several objects, and a survey of compact structure in unidentified hydroxyl radical/infrared (OH/IR) astronomical objects. The continuum VLBI research includes mapping (using phase closure) the structure of several extragalactic radio sources, particularly the radio sources NRAO 150 and 30395. Monitoring the compact flux of a large number of variable sources at regular intervals will also be carried-out.

10.0017, OPERATION OF CLARK LAKE RADIO OBSERVATORY

W.C. Erickson, University of Maryland, College Park Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (AST79-08942)

Support is to cover a program of observations with the University of Maryland Teepee Tee Telescope at the Clark Lake Observatory in southern California and to complete the expansion of the present system into a multi-frequency radioheliograph. The radio spectra of quasars, supernova remnants, flare stars, and clusters of galaxies will be observed, along with compact and variable sources at decameter wavelengths, which will help to identify the energy generation and radio emission processes. Also planets and other objects of interest will be observed. Studies of the radio emission from the quiet and the active Sun are planned, with emphasis on coordination of investigations with the Solar Maximum Mission experiments. This will permit study of the nature and origin of coronal transients in collaboration with the White Light Coronagraph Experiment aboard SMM. Similarly, two-dimensional images of drifting bursts with time resolution of 10 milliseconds will assist in understanding the nature of hard x-ray spike bursts, their quasi-periodicity and the electron acceleration process. Images of type II and type IV sources associated with hard x-rays will be crucial in answering the question of origin of coronal hard x-rays, and in studying the physical processes involved.

10.0018, RADIATIVE TRANSFER - GRAVITATIONAL DYNAMICS

G. Rybicki, Smithsonian Institution, Astrophysical Observatory, strophysical Observatory, *60 Garden St., Cambridge, Massachusetts* 02138 (31T-4T50-05,06)

Work in radiative transfer theory has been in the area of resonance line transfer, transfer in multilevel atoms, spherical media and media with inhomogeneities. There has been particular involvement with basic methodology of these problems, especially in those adaptable to digital computation. Recent work on the newly discovered Q integral of the equation of transfer has been extended to another integral, called the P integral.

Collaborations with P. Noerdlinger on radiative transfer in rapidly expanding clouds (Astrophys. Journ., in press), have been completed as well as continuing joint efforts with P.G. Martin on radiative transfer through circumstellar dust shells. This latter work should aid understanding of the infrared spectrum of such objects.

In the field of gravitational dynamics Dr. Rybicki has worked on the statistical mechanics of gravitating systems and on methods of simulating galactic dynamics. He has completed experiments with Mr. G. Zimmermann on a new method of simulating solutions to the linearized Vlasov equation, the method of perturbation particles. Also, with Dr. Lecar and Miss M. Schaefer he has developed a method of relating surface mass densities of flattened systems, such as spiral galaxies, to the law of force in the plane of these systems. This method is also being applied to the inverse problem of finding surface mass densities from observed rotation curves of spiral galaxies.

Observatory

10.0019, A SEARCH FOR SPHERICAL HALOS OF SPIRAL GALAXIES

D.J. Hegyi, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Physics, *Ann Arbor, Michigan* 48104 (AST76-22109 A02)

A new photometric instrument, an annular scanning photometer (ASP), has recently been used to detect an optical halo surrounding the giant spiral galaxy NGC 4565. The halo is visible out to a distance of 34 kpc from the plane of the disk, a distance equal to 63 percent of the optical disk radius visible on the Palomar Sky Survey red prints. At this distance, the halo surface brightness was 1 part in 1,000 of the night sky in the spectral band of the instrument. Based on some preliminary V-I photometric data and the lack of other possible sources for the optical emission, it was concluded that the halo is composed of K7 or redder type stars and may be quite massive.

Observations will be extended to other galaxies and to obtain measurements out to greater radial distances. Most significantly, it will be attempted to determine the mass in halos. To do this, it will be necessary to conduct a major program in multicolor photometry. At this time the ASP is the most suitable instrument for this program.

This is a continuation of research being done under AST-7622109A01.

10.0020, STUDIES OF SUPERNOVAE AND SUPERNOVA REMNANTS

R.P. Kirshner, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Astronomy, *Ann Arbor, Michigan* 48104 (AST77-17600 A01)

This project will be concerned with studies of the properties of supernovae. Spectrophotometry of extragalactic supernovae will be carried-out in order to establish the type and age of supernovae. The spectra will be used to obtain a physical and chemical analysis of these objects. Distances to these supernovae will also be determined. Supernova remnants in our galaxy and the Andromeda galaxy will be observed in order to obtain information on the evolution of the remnants and conditions in the interstellar medium.

The work will make use of the facilities at the McGraw-Hill Observatory at Kitt Peak. The telescope is equipped with a television guider that will permit easy acquisition of objects as faint as 18th magnitude. Spectral scans will be obtained with a 2000-channel intensified reticon scanner.

10.0021, STUDIES OF THE DYNAMICS OF ELLIPTICAL GALAXIES

M. Schwarzschild, Princeton University, Graduate School, Dept. of Astrophysical Sciences, *205 Nassau Hall, Princeton, New Jersey* 08540 (AST78-23796)

Elliptical Galaxies have long been considered as giant stellar systems, each rotating around its axis and having a symmetrical figure around this axis (such as oblate spheroids). In recent years, however, observtional and theoretical indications have been uncovered which suggest that this earlier picture may be an oversimplification and that the true figures of Elliptical Galaxies may be significantly more complicated (such as tri-axial elipsoids). The question then arises whether tri-axial stellar systems can exist in long-lasting dynamical equilibrium, a necessary condition for models of Elliptical Galaxies. It is here proposed to approach this question numerically, but not by N-body calculations. In contrast to this latter approach, tri-axial configuration appropriate for an Elliptical Galaxy is chosen from the outset. Next, the gravitational force exerted by this configuration on any star within it is derived. Third, stellar orbits following this force are computed, one at a time, in contrast with N-body computations. Finally, according to the proposed plan, each orbit is statistically occupied by a certain number of stars such that all the stars on all the orbits together reproduce the configuration chosen at the outset. If this last step succeeds in as conclusive a manner as can be hoped for from a numerical approach (in contrast to a basic mathematical approach, if feasible), then tri-axial configurations would appear likely better models for the majority of Elliptical Galaxies than the earlier axially symmetrical ones and new questions regarding their mode of origin would arise.

This is a continuation of AST-7522924A02.

10.0022, STUDIES OF THE STRUCTURE AND DISTRIBUTION OF INTERSTELLAR MOLECULAR CLOUDS AND THE THEORY OF WATER MASERS

M. Morris, Columbia University, School of Arts & Sciences, Dept. of Astronomy, *Broadway & W. 116th St., New York, New York* 10027 (AST79-02601)

There are four facets to the research on interstellar molecular gas. The first is an observational study of cloud edges. The goal is to determine the relative depths of the many layers of neutral hydrogen (HI), molecular hydrogen (H2), ionized carbon, (C ion), carbon monoxide (CO), at the interfaces between molecular clouds and the interstellar medium. Theories of molecule formation will be tested by deriving a model for the interstellar ultraviolet radiation field. The second project is an observational study of filamentary molecular clouds. Known examples will be studied in order to determine their mass, their alignment with the local galactic magnetic field, and their detailed velocity field. The third area of research is the molecular cloud component of external galaxies. Observations with a new generation of receivers will be made of the CO distribution in nearby spiral galaxies. The direct determination of CO (thus H2) distributions, in tandem with 21-cm. observations, is of great importance for models of galactic evolution. A comparison of the molecular gas in nearby spirals with that in the galaxy will be made. The fourth area is a theoretical study of water (H2O) masers from star formation regions. Radiative transfer calculations will be undertaken within the previously-proposed geometrical framework of a molecular disk surrounding a luminous star. The goal will be to make predictions about the shapes of individual maser spots that can be tested.

10.0023, STUDIES OF DEGENERATE STARS

H.M. VanHorn, University of Rochester, School of Arts & Sciences, Dept. of Physics & Astronomy, *260 Crittenden Blvd., Rochester, New York* 14627 (AST79-09391)

This project will be concerned with several areas of degenerate star research. The atmospheres, the internal structure and evolution, and the nonradial oscillations of white dwarf stars will be studied. The effects of accretion upon the surface layers of white dwarf stars will be examined. There will be a study of the structure and evolution of cooling and accreting neutron stars. Work on the development of computer codes to permit the calculation of self-consistent, quasi-static models of the evolution of rotating neutron stars will be continued. There will also be research on the evolution of magnetic fields in degenerate stars.

10.0024, OBSERVATIONS OF BINARY AND PROPER-MOTION STARS

W.D. Heintz, Swarthmore College, Graduate School, Dept. of Astronomy, *Swarthmore, Pennsylvania* 19081 (AST79-06379)

Visual observations by micrometer, spectroscopic, and photographic measurements jointly assist in revealing the properties of binary and multiple stars and of nearby dwarf stars. Principal goals are: Improvement and increase of data on orbital motions, periods, and masses in binary systems; search for undiscovered binary stars, or additional components in known binaries; study of the apparently low incidence of binaries among faint red

stars, and study of small proper-motion errors in connection with the problem of the apparently low incidence of nonluminous companions.

The 61 cm refractor at Swarthmore college is the principal instrument used by the Investigator with the micrometer, to about 12 or 15% of telescope time. Additional micrometer work and other observations are planned at Kitt Peak and Cerro Tololo Observatories.

Prior support was under NSF grant AST 77-12236.

10.0025, GENERAL THEORETICAL STUDIES OF STELLAR CHROMOSPHERES, CORONAE, AND TRANSITION LAYERS

B. Erika, University of Washington, School of Arts & Sciences, Dept. of Astronomy, *Seattle, Washington* 98105 (AST78-21024)

The temperature of a star generally decreases as one goes from the interior to the outer atmosphere. We know, however, that in the outer layers of the Sun the temperatre increases from 5800 degrees at the base of the photosphere to 10,000 degrees in the chromosphere to 1.5 million degrees in the corona. If the only form of energy transport is through radiative processes, then such temperatures could not occur in the corona. It is clear that the chromosphere and corona of the Sun must be heated by some form of nonthermal energy like soundwaves, shockwaves, or magneto-hydrodynamic waves. The exact manner in which the solar chromosphere and corona are heated and how this heating depends on height remains uncertain.

It is now possible to observe chromospheres and coronae in other stars. Observations of different stars show large variations in radiation from these layers. The studies that will be carried-out will be aimed at determining how the temperature and pressure stratifications and the radiation from the chromosphere and transition layer depend on the heating mechanisms. This will enable one to determine how the observed differences in the observations relate to differences in chromospheric structure and heating.

10.0026, PUBLICATION OF THE ATLAS OF THE ANDROMEDA GALAXY

P.W. Hodge, University of Washington, School of Arts & Sciences, Dept. of Astronomy, *Seattle, Washington* 98105

An extensive photographic atlas of the Andromeda Galaxy has been prepared with the help of a grant from the National Geographic Society. The photographs for the atlas were taken at the Kitt Peak National Observatory, using the 158-inch telescope. The result is the first complete, large-scale identification atlas of this galaxy, which is the nearest spiral galaxy to ours. The atlas consists of forty 10-inch by 10-inch photographic charts, along with overlays giving the brightness contours of the galaxies, and is accompanied by extensive tables of data on the objects identified on the charts. These various objects include all known globular star clusters, all known open star clusters, the stellar associations, the dark nebulae, and several other kinds of identified features in the galaxy. Altogether, these total over 2,000 objects. The atlas is intended for astronomers and astronomy students, who can gain understanding of the structure and content of spiral galaxies from its study and who can use the charts at the telescope to plan and carry-out new research.

SUPPORTED BY National Geographic Society

10.0027, SURVEY OF SPECTRAL AND POLARIMETRIC VARIABLE QUASI-STELLAR OBJECTS

K.H. Nordsieck, University of Wisconsin, Madison Campus, School of Letters & Science, Dept. of Astronomy, *500 Lincoln Dr., Madison, Wisconsin* 53706 (AST77-06977 A02)

The project involves an observational search for members of the class of quasi-stellar objects often called 'violent variables,' using a portable multi-channel spectropolarimeter built at the University of Wisconsin, mounted on the Cassegrain spectrograph of the 4-meter telescope of the Kitt Peak National Observatory. This instrument is particularly suited for such a project in that it obtains the spectrum (9 Angstrom resolution) and polarization (50-200 Angstrom resolution) of an object simultaneously over 4000 Angstroms. A Kitt Peak compatible version of this instrument has been completed as part of the first phase of this project. Polarized variable candidates for these observations will be obtained from lists of optically identified quasi-stellar objects (QSOs) and radio compact variable sources. Members of this class would be rapidly identified from their characteristically large optical polarization (often 5-30 percent). Additional integration time will give a more exact value of the polarization and the details of the spectrum would be available. Unprofitable telescope time on chance foreground stars would thus be avoided. This class of objects is important in that the variability provides clues to the still mysterious central energy source of quasi-stellar objects and to the relationship of the optical and radio objects. With a moderate list of active sources, a correlation of variability and spectrum could be attempted, and the chances of any one object exhibiting rapid variability during an observing session would be enhanced.

This is a continuation of AST-7706977.

10.0028, IMPROVED INFRARED ARRAY SPECTROMETER SYSTEMS AT THE UNIVERSITY OF WYOMING

R.D. Gehrz, University of Wyoming, School of Arts & Sciences, Dept. of Physics & Astronomy, *P.O. Box 3435, University Station, Laramie, Wyoming* 82070 (AST79-05131)

A new program to develop improved array detectors for infrared astronomy will be started at the University of Wyoming. Construction of new and efficient spectrometers of advanced design will be completed. They will be provided with arrays of state-of-the-art photoconductive detectors. The new detectors will enable the full potentialities of the new spectrometer systems to be fully realized.

The array spectrometer systems will be used in observational programs now being conducted with the 92-inch telescope of the Wyoming Infrared Observatory. The scientific thrust of these programs is to improve our understanding of the formation and death of stars. Observations of regions of high stellar formation activity such as the Orion Nebula will be continued as will studies of such highly-evolved stellar systems as classical novae, Wolf Rayet stars and old dust cocoon stars.

NASA QUIET SHORT-HAUL RESEARCH AIRCRAFT EXPERIMENTERS' HANDBOOK
Robert C. McCracken Jan. 1980 29 p
(NASA-TM-81162; A-8053) Avail: NASA Ames Research Center, Moffett Field, Calif. 94035 CSCL 02A

A summary of guidelines and particulars concerning the use of the NASA-Ames Research Center Quiet Short-Haul Research Aircraft for applicable flight experiments is presented. Procedures for submitting experiment proposals are included along with guidelines for experimenter packages, an outline of experiment selection processes, a brief aircraft description, and additional information regarding support at Ames. J.M.S.

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

PREDICTING TRANSITION TO TURBULENCE IN THE COMPRESSIBLE BOUNDARY LAYER FLOW OVER A SPINNING CONE Ph.D. Thesis
Peter A. Torpey 1979 134 p
Avail: Univ. Microfilms Order No. 8002543

A method was developed for theoretically predicting where the transition from laminar to turbulent flow occurs in the boundary layer over a spinning cone at an angle of attack in supersonic flight. It is based on the linear stability theory for a viscous, compressible fluid. Using this theory, small disturbances are followed as they amplify and propagate along the surface of the cone. By correlating theoretically obtained disturbance amplitudes with experimental data, it is possible to develop a meaningful criterion for determining the location of transition. The method is successful in correlating theory and experiment for a 10 half-angle cone in supersonic flight. The results presented indicate how the location of transition over the cone is influenced by spin rate, angle of attack, and Mach number. Dissert. Abstr.

N80-16026 California Univ., Los Angeles.
THE MOTION OF A VORTEX PAIR IN A STRATIFIED MEDIUM Ph.D. Thesis
Jack Dickran Tomassian 1979 133 p
Avail: Univ. Microfilms Order No. 8001414

An experiment was constructed to simulate and study the motion of a vortex pair in a stratified atmosphere. The vortex trajectories indicate that the pair initially accelerates and its separation decreases when stratification is dominating, in agreement with Crow's theoretical predictions. However, a short time later, the speed of the pair decreases and its separation increases in the stratified as well as the unstratified cases. A peak in the trajectories is observed to occur at an Nt of 2.4 for all Nb sub 0/V sub 0, in agreement with observations from real aircraft. The increase in separation is caused by turbulence, and the data agree with recent numerical computations of vortex pair trajectories in a stratified medium with turbulence. As stratification is increased, the separation and the speed of the pair decreases relative to the unstratified case due to counter-sign vorticity at the boundary of the recirculation cell. Dissert. Abstr.

N80-16027 Cincinnati Univ., Ohio.
MAXIMUM LIKELIHOOD IDENTIFICATION OF AIRCRAFT PARAMETERS WITH UNSTEADY AERODYNAMIC MODELLING Ph.D. Thesis
Dinesh Achyut Keskar 1979 105 p
Avail: Univ. Microfilms Order No. 8002115

A simplified aerodynamic force model based on the physical principle of Prandtl's lifting line theory and trailing vortex concept has been developed to account for unsteady aerodynamic effects in aircraft dynamics. An indicial lift function associated with circulation has been derived for tapered, swept wings in incompressible flow by representing the wings with a simple vortex system. Similarly, an equation is developed to compute downwash at the tail caused by wing lift. The equations derived are approximated by the convenient exponential functions. A family of curves is plotted for the constants in the exponential functions for various aspect ratios, taper ratios and sweep angles at the wing quarter-chord line. The results from these approximations compare well with the limited available results from more rigorous and complex methods. Dissert. Abstr.

N80-16028 Stanford Univ., Calif.
A GENERAL METHOD TO DETERMINE THE STABILITY OF COMPRESSIBLE FLOWS Ph.D. Thesis
Rolf Adolf Guenther 1979 133 p
Avail: Univ. Microfilms Order No. 8001932

The stability equation based on one dependent variable was found and was examined to determine the stability of a compressible swirling jet. The results obtained were very similar to those of Lallas for finite domains. There are differences that could be explained to slight changes in initial assumptions and also due to the fact that the interval of integration is all space rather than a finite subspace. The second approach was that of

using a Lagrangian approach to the problem. Since the equations developed were based on different assumptions, the condition of stability was compared only for the Rayleigh problem of a swirling flow, both examples reduce to the Rayleigh criterion. The second method allows including the viscous shear terms which is not possible in the first method. The same problem was again examined to see what effect shear has on stability.
Dissert. Abstr.

INVESTIGATION OF GROUND EFFECTS ON LARGE AND SMALL SCALE MODELS OF A THREE FAN V/STOL AIRCRAFT CONFIGURATION
E. P. Schuster, T. D. Carter, and D. W. Esker. Jul. 1979. 149 p. refs.
(Contract NAS2-9690)
(NASA-CR-152240; MDC-A5702). Avail: NASA, Ames Research Center, Moffett Field, Calif. Attn: Hervey Quigley. CSCL 01A.

Induced lift of a subsonic, three fan, lift/cruise, V/STOL aircraft configuration was investigated using scale models of a multimission aircraft whose design incorporates a nose mounted lift fan and two lift/cruise units located over the wing. Configuration effects were assessed for lift improvement devices, lift/cruise nozzle rails, nozzle perimeter plates, and alternate nose fan exit hubs. Tests were conducted at four model heights (H/D = 0.95, 1.53, 3.06 and 6.45, where D is the average nozzle exit diameter equal to 0.997 m.) Results are presented and discussed.

APPLICATION OF NUMERICAL OPTIMIZATION TO THE DESIGN OF WINGS WITH SPECIFIED PRESSURE DISTRIBUTIONS. Final Report
H. P. Haney and R. R. Johnson. Feb. 1980. 108 p.
(Contract NAS2-9653)
(NASA-CR-3238). Avail: NTIS. HC A06/MF A01. CSCL 01A.

A practical procedure for the optimum design of transonic wings is demonstrated. The procedure uses an optimization program based on the method of feasible directions coupled with an aerodynamic analysis program which solves the three-dimensional potential equation for subsonic through transonic flow. Two new wings for the A-7 aircraft were designed by using the optimization procedure to achieve specified surface pressure distributions. The new wings, along with the existing A-7 wing, were tested in the Ames 11 ft transonic wind tunnel. The experimental data show that all of the performance goals were met. However, comparisons of the wind tunnel results with the theoretical predictions indicate some differences at conditions for which strong shock waves occur.

WIND-TUNNEL/FLIGHT CORRELATION STUDY OF AERODYNAMIC CHARACTERISTICS OF A LARGE FLEXIBLE SUPERSONIC CRUISE AIRPLANE (XB-701). 2: EXTRAPOLATION OF WIND-TUNNEL DATA TO FULL-SCALE CONDITIONS
John B. Peterson, Jr., Michael J. Mann, Russell B. Sorrells, III, Wallace C. Sawyer, and Dennis E. Fuller. Feb. 1980. 80 p. refs.
(NASA-TP-1515; L-12688). Avail: NTIS. HC A05/MF A01. CSCL 01A.

The results of calculations necessary to extrapolate performance data on an XB-70-1 wind tunnel model to full scale at Mach numbers from 0.76 to 2.53 are presented. The extrapolation was part of a joint program to evaluate performance prediction techniques for large flexible supersonic airplanes similar to a supersonic transport. The extrapolation procedure included: interpolation of the wind tunnel data at the specific conditions of the flight test points; determination of the drag increments to be applied to the wind tunnel data, such as spillage drag, boundary layer trip drag, and skin friction increments; and estimates of the drag items not represented on the wind tunnel model, such as bypass doors, roughness, protuberances, and leakage drag. In addition, estimates of the effects of flexibility of the airplane were determined.

DEVELOPMENT OF PANEL METHODS FOR SUBSONIC ANALYSIS AND DESIGN. Final Report
D. R. Bristow. Feb. 1980. 84 p. refs.
(Contract NAS1-15369)
(NASA-CR-3234). Avail: NTIS. HC A05/MF A01. CSCL 01A.

Two computer programs, developed for subsonic inviscid analysis and design are described. The first solves arbitrary mixed analysis design problems for multielement airfoils in two dimensional flow. The second calculates the pressure distribution for arbitrary lifting or nonlifting three dimensional configurations. In each program, inviscid flow is modelled by using distributed source doublet singularities on configuration surface panels. Numerical formulations and representative solutions are presented for the programs.

THE AERODYNAMICS OF A JET IN A CROSSFLOW. Final Report
K. T. Yen. 11 Dec. 1978. 62 p. refs.
(AD-A076375; NADC-78291-60). Avail: NTIS. HC A04/MF A01. CSCL 01/1.

The aerodynamics of a jet in a crossflow considered as the key problem in transition aerodynamics for VSTOL aircraft were reviewed. Experimental results on the flow structure of the jet, the contrarotating vortices, the jet entrainment phenomenon, and the surface pressure distributions were analyzed. The influences on these characteristics by the jet parameters such as the velocity ratio, injection angle and jet orifice shape were considered based on available measurements. In the theoretical area, particular attention was directed to the methods of prediction and analysis, and the fundamental physical bases of these methods. Current developments in transition aerodynamics, and some recent work on the formation of contrarotating vortices and the wake flow are described.

WING FLAPPING WITH MINIMUM ENERGY
R. T. Jones. Jan. 1980. 18 p. refs.
(NASA-TM-81174; A-9076). Avail: NTIS. HC A02/MF A01. CSCL 01A.

For slow flapping motions it is found that the minimum energy loss occurs when the vortex wake moves as a rigid surface that rotates about the wing root - a condition analogous to that determined for a slow-turning propeller. The optimum circulation distribution determined by this condition differs from the elliptic distribution, showing a greater concentration of lift toward the tips. It appears that very high propulsive efficiencies are obtained by flapping.

A COMPARISON OF CALCULATED AND EXPERIMENTAL LIFT AND PRESSURE DISTRIBUTIONS FOR SEVERAL HELICOPTER ROTOR SECTIONS
John Conlon. Jan. 1980. 33 p. refs.
(NASA-TM-81160; A-8029). Avail: NTIS. HC A03/MF A01. CSCL 01A.

The use of computational techniques in predicting lift coefficients and pressure distributions of two dimensional airfoil sections was studied. The computer code FLO6/IBL was used to solve the compressible, two dimensional flow about four different airfoil sections. The lift coefficients of the airfoils were

calculated at various angles of attack at subsonic Mach numbers and compared with experimental data. A.W.H.

SUMMARY OF THEORETICAL AND EXPERIMENTAL INVESTIGATIONS OF VORTEX LIFT AT HIGH ANGLES OF ATTACK. Final Report, 1 Jan. 1974 - 31 Mar. 1979
D. S. JanakiRam, Satish S. Samant, and Richard P. White, Jr. May 1979 166 p refs
(Contract N00014-74-C-0091)
(AD-A074483; RASA/SRL-14-79-03; ONR-CR-212-223-5-F) Avail: NTIS HC A08/MF A01 CSCL 20/4

This summary report presents the development and verification of a theoretical prediction method for predicting aerodynamic characteristics of low aspect ratio and delta wings at high angles of attack. A summary of the experimental measurements made on low aspect ratio swept wings with leading edge vortex devices is presented as well as a discussion of the final computer program that was developed and correlated with experimental data obtained on swept and delta wings during the last year of the contract effort. INSTRUMENTATION MODELING TECHNIQUE USED IN THE IDENTIFICATION OF AERODYNAMIC COEFFICIENTS FROM FLIGHT TEST DATA
W. E. Williamson Jr. 1978 13 p refs Presented at the Astronautical Congr., Dubrovnik, Yugoslavia, 1 Oct. 1978
(Contract EY-76-C-04-0789)
(SAND-78-0721C; CONF-781037-1) Avail: NTIS HC A02/MF A01

A number of estimation methods used to compute aerodynamic coefficients of ballistically flown spinning vehicles often ignore possible phase shifts between data and the model of the motion. Some of these problems occur because onboard instrumentation such as rate gyros or accelerometers behave like spring mass systems. If the vehicle motion is near the resonance frequency of the instrument, then the output of the instrument is shifted in phase from the actual motion and probably the model representation of the motion. In order to demonstrate this problem, the aerodynamic coefficients of a spinning vehicle are computed from actual flight test data using a standard least squares estimation scheme. The problem just described is shown to exist for that data. A modeling scheme is derived to compensate for the instrumentation-induced changes in the data. The results obtained using the instrumentation modeling scheme are shown to be much better than those obtained using a standard scheme. DOE

N80-16039# Sandia Labs., Albuquerque, N. Mex. System Studies Dept.
AERODYNAMIC COEFFICIENT ESTIMATION BY MEANS OF AN EXTENDED KALMAN FILTER
James R. Kelsey 1979 19 p refs Presented at the Atmospheric Flight Mech. Conf., Boulder, Colo., 6 Aug. 1979 Prepared in cooperation with New Mexico Univ., Albuquerque
(Contract EY-76-C-04-0789)
(SAND-79-0411C; CONF-790826-1) Avail: NTIS HC A02/MF A01

An extended, augmented Kalman filter is used to study several dynamic models of vehicle motion aimed at estimating the aerodynamic moment coefficients. These models consider various state representations as well as various measurement sets. Linear and cubic symmetric moments are considered as well as linear asymmetric moments. Computer generated data representative of a reentry vehicle flight are used as the simulated measurement information. Coefficient estimates and error estimates are given for each of the models studied. The computer time required for estimate convergence is also shown, indicating that near-real-time estimation is possible. DOE

A STUDY OF AERODYNAMIC METHODS FOR IMPROVING TRUCK FUEL ECONOMY
Frank T. Buckley, Jr., Colin H. Marks, and William H. Walston, Jr. Dec. 1978 404 p refs
(Grant NSF SIA-74-1843)
(PB80-101272; NSF/RA-780680) Avail: NTIS HC A18/MF A01 CSCL 13F

Results of a 3-year program to investigate aerodynamic means to reduce fuel consumption of tractor-trailer trucks are reported. The study considers the benefit of aerodynamic add-on devices to reduce the aerodynamic drag on existing vehicles, and the influence of design alternatives in reducing the drag of future vehicles. Drag reductions of both commercial and newly-developed retrofit drag reducing devices are evaluated. Full scale test results indicate that wind turbulence effects cause the full-scale drag reductions produced by retrofit devices to be generally less than those found in the wind tunnel. The decrease is found to be a function of the design of the device and the ambient conditions in which it is used. GRA

THE AERODYNAMICS OF TRACKED RAM AIR CUSHION VEHICLES - EFFECTS OF PITCH ATTITUDE AND UPPER SURFACE FLOW. Final Report, Sep. 1973 - Feb. 1979
T. M. Barrows, H. C. Curtiss, Jr., and W. F. Putman Oct. 1979 141 p refs
(Contract DOT-TSC-682)
(PB80-101827; MAE/TR-1426; DOT-TSC-RSPA-79-17) Avail: NTIS HC A07/MF A01 CSCL 13F

Three types of experiments were conducted on geometrically similar models of a Tracked Ram Air Cushion Vehicle (TRACV): (1) wind tunnel tests with the vehicle model positioned within a short segment of stationary guideway; (2) the vehicle model was towed through a 300-foot guideway and the equilibrium position was measured as a function of model weight and center-of-gravity location; and (3) a moving carriage which held the model at a fixed orientation relative to the guideway. Simplified theories are developed for the flow over the upper surface of the model and for the effect of pitch attitude on the flow under the lower surface. The level of agreement between the theory and the various testing techniques is discussed. GRA

03 AIR TRANSPORTATION AND SAFETY

Includes passenger and cargo air transport operations; and aircraft accidents.

AIR TRAFFIC CONTROL/FULL BEACON COLLISION AVOIDANCE SYSTEM, KNOXVILLE SIMULATION Final Report, Apr. - May 1978
B. Billmann, T. Morgan, R. Strack, and J. Windle Aug. 1979 47 p refs
(FAA Proj. 052-241-310)
(AD-A074555; FAA-RD-79-25) Avail: NTIS
HC A03/MF A01 CSCL 17/7

The interaction between a full beacon collision avoidance system (BCAS) and the present air traffic control (ATC) system in a real-time simulation environment was investigated to determine the impact of BCAS on controllers and control procedures, the requirement of BCAS information to be displayed to the controller, and the effectiveness of alarm threshold desensitization in a terminal area. An additional objective was to evaluate the BCAS algorithm performance in terms of number, duration, and location of alerts and resolution effectiveness. Analysis of results indicates that the presence of BCAS in a moderate-density ATC terminal environment has no adverse effect on controllers or control procedures because of an extremely low positive command rate. A high number of BCAS advisory alerts which were displayed to aircraft but not to controllers had no effect on aircraft flightpaths. Many of these alerts were generated for aircraft navigating on established airways with proper ATC separation. A significant number of participating controllers favored the use of BCAS as a backup to the ATC system. A.R.H.

EVALUATION OF THE POTENTIAL FOR REDUCED LONGITUDINAL SPACING ON FINAL APPROACH
William J. Swedish Washington DOT Aug. 1979 126 p refs
(Contract DOT-FA79WA-4184)
(AD-A076434; FAA-EM-79-7; MTR-79W00280) Avail: NTIS
HC A07/MF A01 CSCL 17/7

The feasibility of reduced IFR separation standards on final approach is addressed as well as the identification of the characteristics of the ATC system which affect or are affected by the separation standards. The conditions were limited to those times during which wake turbulence is not a factor. Given this assumption, separation reduction is limited by the need to avoid simultaneous runway occupancy by successive arrivals. Various technical improvements now under development may make it possible to operate a 2.0 nmi minimum with average runway occupancies as great as 45-50 seconds. Adequate communications and surveillance for the controller, and enforcement of current ATC procedures are also required for operations with reduced separations. An alternative solution to the runway occupancy problem is to use a pair of closespaced, dependent (dual-lane) runways and alternate arrivals between them. Reduced separation on approach to a single runway cannot be realized until the wake vortex problem is resolved. Although there do not appear to be any other technical or operational barriers to reduced separation standards, additional research is required before reduced standards can be implemented. M.M.M.

RESULTS OF A LORAN-C FLIGHT TEST USING AN ABSOLUTE DATA REFERENCE
Joseph P. Fischer Jan. 1980 22 p refs
(Grant NGR-36-009-017)
(NASA-CR-162751; TM-74) Avail: NTIS HC A02/MF A01 CSCL 17G

A closed circuit flight test was conducted in the Boston area using VOR's and NDB's as reference points. The Loran-C data collected during the flight was then compared against a reference provided by the Discrete Address Beacon System (DABS) facility at Lincoln Laboratories. A MIT crew used a commercial receiver and recorded Loran-C time differences which would also be compared with the data provided by the DABS facility and eventually with the data collected by Ohio University. The Ohio University low-cost receiver was used for this test which was conducted in the Ohio University DC-3 flying laboratory. The Loran-C time-difference data was recorded with a microcomputer data collection system and stored on magnetic tape for subsequent analysis. The MIT receiver was also on board the DC-3, and recorded its data on a cassette tape which was later used by the MIT crew for data analysis. The equipment configuration in the aircraft, the flight procedure and the results obtained from the data collected with Ohio University's receiver and recording system are described. A.R.H.

N80-16052# Hawaii Univ., Honolulu.
LONG-RANGE ELECTRONIC NAVIGATION SYSTEMS IN THE HAWAIIAN ARCHIPELAGO
James Kennedy, Susan Holt, and Peter Hendricks May 1979 6 p refs
(PB-300842/2; UNIHI-SEAGRANT-AB-79-06;
NOAA-79082107) Avail: NTIS HC A02/MF A01 CSCL 17G

Electronic navigation systems operational in the Hawaiian Archipelago are considered. These include: Loran-A, Loran-C, Omega, and satellite navigation. The Loran-A system is scheduled to be phased out and users must switch to an alternative system. Information on the three continuing systems is given in order to help the navigator select an appropriate system. Fix accuracy (absolute and repeatable), area coverage, and receiver cost are given for each system. The Loran-C system is emphasized. GRA

Collision avoidance systems in three modes of transportation (i.e. air, surface, marine) are investigated. Traffic scheduling, automatic ground based stations, and on board warning systems for air transportation are discussed. The sensors and detectors relative to marine transportation collision avoidance are examined. Engineering research relative to highway and rail collision avoidance is reported. This bibliography contains 383 abstracts, 45 of which are new entries to the previous edition. GRA

PARAMETER IDENTIFICATION OF FLEXIBLE FLIGHT VEHICLES ASSUMING A LOW-REDUCED-FREQUENCY AERODYNAMIC REPRESENTATION Ph.D. Thesis
Robert Charles Schwanz 1979 184 p
Avail: Univ. Microfilms Order No. 8002138

The derivation and numerical demonstration of a recursive, sequential least squares method that may be used to identify the steady and unsteady aerodynamic parameters of a flexible vehicle from its flight test measurements is discussed. The state and measurement equations employed result from mathematical approximations of the vehicle dynamics developed using a state reduction procedure. The aerodynamics mathematical approximation considered is based upon a low reduced-frequency expansion of the potential flow equations. These approximations are most applicable to low aspect ratio flight vehicles operating at subsonic and supersonic speeds. It is demonstrated that the aerodynamic parameters may be estimated if the static aeroelastic measurement residual is employed to guide the reduction of state, the selection of control inputs, and the location of sensors. Dissert. Abstr.

MEANS FOR CONTROLLING AERODYNAMICALLY INDUCED TWIST Patent Application
Wolf Elber, inventor (to NASA) Filed 28 Sep. 1979 10 p
(NASA-Case-LAR-12175-1; US-Patent-Appl-SN-079913) Avail: NTIS HC A02/MF A01 CSCL 01C

A wing twist deformation control mechanism which provides active compensation for aerodynamically induced twist deformation of high aspect ratio wings is described. The twist deformation control mechanism consists of a torque tube, internal to each wing and rigidly attached near the tip of each wing, and an actuator located in the aircraft fuselage. As changes in the aerodynamic loads on the wings occur, the torque tube is rotated to compensate for the induced wing twist. NASA

AN EVALUATION OF THE ADINA FINITE ELEMENT PROGRAM FOR APPLICATION TO AIRCRAFT OVERPRESSURE VULNERABILITY Final Report, 12 Nov. 1977 - 31 Oct. 1978
Thomas R. Stagliano and Lawrence J. Mente Feb. 1979 80 p refs
(Contract DNA001-78-C-0057)
(AD-A074261; AD-E300579; KA-TR-162; DNA-4876F) Avail: NTIS HC A05/MF A01 CSCL 01/3

In aircraft overpressure vulnerability, stiffened thin-walled panel configurations are subjected to surface pressure loadings of varying time histories. These dynamic loads subject the impinged structural components to large deflections and an elastic-plastic material response. The ability to predict accurately the deflection and strain time histories of complex aircraft structures of arbitrary geometry has become of increasing importance. The ADINA (Automatic Dynamic Incremental Nonlinear Analysis) computer code is evaluated to determine if it is a numerically accurate, computationally efficient means of analyzing these complex structures under transient pressure loading. In this initial evaluation, the ADINA solutions for clamped beams, simply supported, and clamped flat unstiffened panels and flat stiffened panels subjected to transient pressure loadings are compared with solutions from other nonlinear structural codes. ADINA was found to be an efficient and accurate computer code which provides the full nonlinear capability required for aircraft vulnerability analysis. Shortly, a new version of ADINA will be available that contains a desirable thin shell element. However, ADINA finite elements would still have to be extended to include various shaped stringer and frame cross sections and multilayered skin configurations associated with aircraft structures. INFRARED MEASUREMENTS OF A SCRAMJET EXHAUST Final Report
R. A. Reed and M. W. Slack. Jan. 1980. 27 p. refs
(Contract NAS1-15395)
(NASA-CR-3242) Avail: NTIS HC A03/MF A01 CSCL 21E

Diagnostic 2 - 5 mm infrared spectra of a hydrogen burning scramjet exhaust were measured with an interferometer spectrometer. Exhaust gas temperatures and water vapor partial pressures were determined from the observed intensity and spectral profile of the H2O 2.7 mm infrared emission band. Overall engine combustion efficiencies were derived by combining these measurements with the known engine operating conditions. Efficiencies fall (70 - 50 percent) as fuel equivalence ratios rise (0.4 - 1.0). Data analysis techniques and sensitivity studies are also presented. Author

TITANIUM COMBUSTION IN TURBINE ENGINES Final Report
Thomas R. Strobridge, John C. Moulder, and Alan F. Clark. Washington DOT, Jul. 1979. 131 p. refs
(Contract DOT-FA78WAI-831)
(AD-A075657; NBSIR-79-1616; FAA-RD-79-51) Avail: NTIS HC A07/MF A01 CSCL 11/6

Pure and alloyed titanium components are routinely used in aircraft turbine engines because of their uniquely high strength-to-weight ratios among structural metals, combined with excellent fatigue and corrosion resistance. Like most other metals, titanium is combustile under certain conditions of temperature, pressure and oxygen concentration and in fact there have been several instances of titanium combustion in service engines. Contemporary titanium use in aircraft turbine engines and the limits of that use are explored. Combustivn incidents and their causes are discussed as well as the typical extent of damage. Current preventative measures are outlined. For better understanding, the fundamentals of metal combustion and the experimental research related to titanium combustion are thoroughly treated and analytical combustion models are presented. Finally, the relevant experimental combustion data are correlated as a function of static temperature and Reynolds number and compared to the model predictions. Author

EXPANDED STUDY OF FEASIBILITY OF MEASURING IN-FLIGHT 747/JT9D LOADS, PERFORMANCE, CLEAR-

ANCE, AND THERMAL DATA
G. P. Sallee and R. L. Martin (Boeing Commercial Airplane Co., Seattle, Wash.) 4 Feb. 1980 107 p
(Contract NAS3-20632)
(NASA-CR-159717; PWA-5512-46) Avail: NTIS HC A06/MF A01 CSCL 21E

The JT9D jet engine exhibits a TSFC loss of about 1 percent in the initial 50 flight cycles of a new engine. These early losses are caused by seal-wear induced opening of running clearances in the engine gas path. The causes of this seal wear have been identified as flight induced loads which deflect the engine cases and rotors, causing the rotating blades to rub against the seal surfaces, producing permanent clearance changes. The real level of flight loads encountered during airplane acceptance testing and revenue service and the engine's response in the dynamic flight environment were investigated. The feasibility of direct measurement of these flight loads and their effects by concurrent measurement of 747/JT9D propulsion system aerodynamic and inertia loads and the critical engine clearance and performance changes during 747 flight and ground operations was evaluated. A number of technical options were examined in relation to the total estimated program cost to facilitate selection of the most cost effective option. It is concluded that a flight test program meeting the overall objective of determining the levels of aerodynamic and inertia load levels to which the engine is exposed during the initial flight acceptance test and normal flight maneuvers is feasible and desirable. A specific recommended flight test program, based on the evaluation of cost effectiveness, is defined. A.R.H.

RESEARCH ON THE FLUTTER OF AXIAL TURBOMACHINE BLADING
Fernando Sisto and Mark Ward Sep. 1979 41 p refs
(Contract N00014-76-C-0540; NR Proj. 094-363)
(AD-A074597; ME-RT-79004) Avail: NTIS HC A03/MF A01 CSCL 20/4

Typical aerodynamic moment and free flutter measurements are presented for negative stagger of thin airfoils in an annular cascade. The parameters of interest for the free flutter measurements are incidence angle, torsional amplitude, and reduced frequency (reduced velocity). For moment measurements, the significant parameters are mean incidence angle, interblade phase angle, and amplitude of oscillation. Since measurements take the form of a continuous record of moment versus angular position, the symbolic name 'moment loops' is used. The characteristics of the experimental data are discussed and comparison is made with earlier test data for positive stagger angle with the same airfoil. GRA

DIGITAL ADAPTIVE CONTROLLERS FOR VTOL VEHICLES. VOLUME 1: CONCEPT EVALUATION Final Report
G. L. Hartmann, Gunter Stein, and Stephen G. Pratt Nov. 1979 196 p refs 2 Vol.
(Contract NAS1-14921)
(NASA-CR-159154-Vol-1; HONEYWELL-2825-41592-Vol-1)
Avail: NTIS HC A09/MF A01 CSCL 01C

A digital self-adaptive flight control system was developed for flight test in the VTOL approach and landing technology (VALT) research aircraft (a modified CH-47 helicopter). The control laws accept commands from an automatic on-board guidance system. The primary objective of the control laws is to provide good command-following with a minimum cross-axis response. Three attitudes and vertical velocity are separately commanded. Adaptation of the control laws is based on information from rate and attitude gyros and a vertical velocity measurement. The final design resulted from a comparison of two different adaptive concepts--one based on explicit parameter estimates from a real-time maximum-likelihood estimation algorithm, the other based on an implicit model reference adaptive system. The two designs were compared on the basis of performance and complexity. A.R.H.

N80-16066*# Honeywell, Inc., Minneapolis, Minn.
DIGITAL ADAPTIVE CONTROLLERS FOR VTOL VEHICLES. VOLUME 2: SOFTWARE DOCUMENTATION Final Report

GROUND RUN-UP NOISE CONTROL FACILITIES FOR CIVIL AIRCRAFT: A SURVEY
David Braslau 30 Jan. 1979 123 p
(Contract W1-78-5339-1)
(AD-A075348; FAA-RD-79-17; ARD-410) Avail: NTIS HC A06/MF A01 CSCL 01/4

This survey of existing ground run-up suppressors and barriers for civil aircraft includes a review of acoustical, aerodynamic, and mechanical effects associated with facilities in the United States, Europe, and Japan. Evaluations were made of each suppressor based upon published and unpublished reports, and supplemented where necessary by direct questionnaires to the operators, designers, and users of the facilities. Acoustical data where available was compiled for near and far field points at all directions from aircraft heading. Aerodynamic and mechanical effects on airframe and engine performance during run-up have been identified in terms of exhaust gas reingestion, engine or airframe damage, or restrictions on facility operation. The potential for standards development is discussed with respect to available information with recommendations for additional studies needed before such standards could be promulgated. M.M.M.

RECENT RESEARCH ON V/STOL TEST LIMITS AT THE UNIVERSITY OF WASHINGTON AERONAUTICAL LABORATORY Final Report
Shojiro Shindo and William H. Rae, Jr. Feb. 1980 27 p refs
(Grant NGL-48-002-035)
(NASA-CR-3237) Avail: NTIS HC A03/MF A01 CSCL 14B

The occurence of flow breakdown during the wind tunnel testing of a powered V/STOL aircraft was studied. Flow breakdown is the low forward speed test limit in a solid wall wind tunnel

and is characterized by a vortex which forms on the floor and walls of the wind tunnel thereby failing to simulate free air conditions. The flow is caused by the interaction of the model wake and tunnel boundary layer and affects the model's aerodynamic characteristics in such fashion as to negate their reliability as correctable wind tunnel data. The low speed test limit was examined using a model that possessed a discretely concentrated powered lift system using a pair of lift jets. The system design is discussed and the tests and results which show that flow breakdown occurs at a velocity ratio of approximately 0.20 are reported. A.W.H.

INFRARED RUNWAY COLLISION AVOIDANCE SYSTEM ANALYSIS Final Report, Sep. 1978 - Mar. 1979
P. E. Powell and G. H. Greenleaf Apr. 1979 87 p refs
(Contract DOT-FA78WA-4196)
(AD-A078131; FAA-RD-79-32; BDM/W-79-099-TR) Avail: NTIS HC A05/MF A01 CSCL 01/5

The applicability and effectiveness of active and passive infrared devices for use in runway collision avoidance systems during low visibility airport operations are addressed. Emphasis is placed on the optical attenuation caused by conditions of fog and haze as a function of detector system wavelength. Two feasible approaches to the use of infrared techniques in runway collision avoidance systems are presented. The recommended approach involves the use of a runway-mounted active CO2 laser system which provides an unambiguous indication of aircraft on the runway. The CO2 laser application has several desirable characteristics which include required all weather conditions. The alternative approach involves the use of a runway-mounted two-color passive IR system for jet engine heat detection. The two-color system is feasible but falls short of providing satisfactory detection range in fog without excessive hardware deployment. The recommended approach to development of a system specification which would include experimental tests and design of a prototype system is discussed. J.M.S.

FEASIBILITY AND CONCEPT STUDY TO CONVERT THE NASA/AMES VERTICAL MOTION SIMULATOR TO A HELICOPTER SIMULATOR Final Report
C. A. Belsterling, R. C. Chou, E. G. Davies, and K. C. Tsui Sep. 1978 150 p
(Contract NAS2-9884; NASA Order C-4952-1)
(NASA-CR-152193) Avail: NTIS HC A07/MF A01 CSCL 14B

The conceptual design for converting the vertical motion simulatior (VMS) to a multi-purpose aircraft and helicopter simulator is presented. A unique, high performance four degrees of freedom (DOF) motion system was developed to permanently replace the present six DOF synergistic system. The new four DOF system has the following outstanding features: (1) will integrate with the two large VMS translational modes and their associated subsystems; (2) can be converted from helicopter to fixed-wing aircraft simulation through software changes only; (3) interfaces with an advanced cab/visual display system of large dimensions; (4) makes maximum use of proven techniques, convenient materials and off-the-shelf components; (5) will operate within the existing building envelope without modifications; (6) can be built within the specified weight limit and avoid compromising VMS performance; (7) provides maximum performance with a minimum of power consumption; (8) simple design minimizes coupling between motions and maximizes reliability; and (9) can be built within existing budgetary figures. R.E.S.

DESIGN CONSIDERATIONS FOR ATTAINING 200-KNOT TEST VELOCITIES AT THE AIRCRAFT LANDING LOADS AND TRACTION FACILITY
Gary L. Giles and Sandy M. Stubbs May 1979 75 p refs
(NASA-TM-80096) Avail: NTIS HC A04/MF A01 CSCL 14B

Design studies are presented which consider the important parameters in providing 200 knot test velocities at the landing loads and traction facility. Two major components of this facility, the hydraulic jet catapult and the test carriage structure, are considered. Suitable factors are determined to correlate analytical data for characteristics of the hydraulic jet catapult with data measured from the existing catapult system. The resulting equations are used to calculate test velocities for a range of jet nozzle diameters and carriage masses with both the current 122 m and an increased 183 m catapult stroke. Using the catapult characteristics, a target design point is selected and a carriage structure is sized to meet the target point strength requirements. A.W.H.

ORBITS NEAR CRITICAL INCLINATION, INCLUDING LUNISOLAR PERTURBATIONS Ph.D. Thesis
Michael Ernest Hough 1979 409 p
Avail: Univ. Microfilms Order No. 8001938

An improved theory is developed of long period perigee motion for near-Earth orbits (semimajor axes less than 6 Earth radii) near the critical inclinations 63.4 deg and 116.6 deg. The inclusion of lunisolar perturbations and all known zonal harmonic coefficients in the geopotential are significant improvements over existing theories. Hamiltonian terms up to and including degree four in eccentricity are modeled. Two different Earth models are compared. Atmospheric drag is not modeled because the orbits analyzed have perigee altitudes above 700 km. The theory is applicable in the orbit determination and long term orbit prediction of such critical inclination satellites as GPS (Global Positioning System) which, due to their high altitudes (20,000 km), are significantly perturbed by the Sun and Moon. Very slow fluctuations (100 year periods) in the perigee location and altitude are predicted near the critical inclinations because there is no average change in perigee location due to oblateness.

EVALUATION OF USE OF MPAD TRAJECTORY TAPE AND NUMBER OF ORBIT POINTS FOR ORBITER MISSION THERMAL PREDICTIONS
Robert A. Vogt Nov. 1979 126 p refs
(NASA-TM-80946; JSC-16303) Avail: NTIS HC A06/MF A01 CSCL 22A

The application of using the mission planning and analysis division (MPAD) common format trajectory data tape to predict temperatures for preflight and post flight mission analysis is presented and evaluated. All of the analyses utilized the latest Space Transportation System 1 flight (STS-1) MPAD trajectory tape, and the simplified '136 note' midsection/payload bay thermal math model. For the first 6.7 hours of the STS-1 flight profile, transient temperatures are presented for selected nodal locations with the current standard method, and the trajectory tape method. Whether the differences are considered significant or not depends upon the view point. Other transient temperature predictions are also presented. These results were obtained to investigate an initial concern that perhaps the predicted temperature differences between the two methods would not only be caused by the inaccuracies of the current method's assumed nominal attitude profile but also be affected by a lack of a sufficient number of orbit points in the current method. Comparison between 6, 12, and 24 orbit point parameters showed a surprising insensitivity to the number of orbit points. R.E.S.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE)

CONTROL OF LARGE SPACE STRUCTURES Final Report
R. Gran, M. Rossi, H. G. Moyer, and F. Austin Apr. 1979 134 p refs
(Contract NAS8-32587)
(NASA-CR-161369; RE-589) Avail: NTIS HC A07/MF A01 CSCL 22B

The control of large space structures was studied to determine what, if any, limitations are imposed on the size of spacecraft which may be controlled using current control system design technology. Using a typical structure in the 35 to 70 meter size category, a control system design that used actuators that are currently available was designed. The amount of control power required to maintain the vehicle in a stabilized gravity gradient pointing orientation that also damped various structural motions was determined. The moment of inertia and mass properties of this structure were varied to verify that stability and performance were maintained. The study concludes that the structure's size is required to change by at least a factor of two before any stability problems arise. The stability margin that is lost is due to the scaling of the gravity gradient torques (the rigid body control) and as such can easily be corrected by changing the control gains associated with the rigid body control. A secondary

conclusion from the study is that the control design that accommodates the structural motions (to damp them) is a little more sensitive than the design that works on attitude control of the rigid body only. R.E.S.

STUDY OF FOLDABLE ELASTIC TUBES FOR LARGE SPACE STRUCTURE APPLICATIONS, PHASE 1 Final Report
Irving W. Jones, Collins Boateng, and Caster D. Williams Jan. 1980 58 p refs
(Grant NsG-1320)
(NASA-CR-162652) Avail: NTIS HC A04/MF A01 CSCL 22B

Structural members that might be suitable for strain energy deployable structures, are discussed with emphasis on a thin-walled cylindrical tube with a cross-section that is called 'bi-convex'. The design of bi-convex tube test specimens and their fabrication are described as well as the design and construction of a special purpose testing machine to determine the deployment characteristics. The results of the first series of tests were quite mixed, but clearly revealed that since most of the specimens failed to deploy completely, due to a buckling problem, this type of tube requires some modification in order to be viable. A.R.H.

15 LAUNCH VEHICLES AND SPACE VEHICLES

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

SATELLITE TIME TRANSFER VIA TRACKING AND DATA RELAY SATELLITE SYSTEM (TDRSS) AND APPLICATIONS
Andrew R. Chi Dec. 1979 23 p refs Presented at the 11th Ann. Precise Time and Time Interval Applications and Planning Meeting, Greenbelt, Md., 27-29 Nov. 1979
(NASA-TM-80605) Avail: NTIS HC A02/MF A01 CSCL 22A

With two geosynchronous relay satellites the tracking and data relay satellite system (TDRSS) can provide nearly worldwide coverage for communication between all near orbiting satellites and the satellite control center at Goddard Space Flight Center. Each future NASA satellite will carry a TDRSS transponder with which the satellite can communicate through a TDRSS to the ground station at White Sands, New Mexico. It is using this system that the ground station master clock time signal can be transmitted to the near Earth orbiting satellite in which a clock may be maintained independently to the accuracy required by the experimenters. The satellite time transfer terminal design concept and the application of the time signal in autonomously operated spacecraft clock are discussed. Some pertinent TDRSS parameters and corrections for the propagation delay measurement as well as the time code used to transfer the time signal are given. A.R.H.

DYNAMIC ANALYSIS OF BEAM-RIDER MISSILE PERFORMANCE
J. Shinar, E. Besner, and Y. Rotsztein Aug. 1979 29 p refs
(TAE-376) Avail: NTIS HC A03/MF A01

Performance of a point defense beam rider missile system with linearized trajectory equations is analyzed taking into account the dynamics of the guidance loop. It is shown that adding a lead term, proportional to the line of sight turn rate, to the guidance command improves the system performance against maneuvering targets at the expense of increased noise sensitivity. A formal solution to the problem of optimal avoidance of beam rider missiles is also presented indicating a 'bang-bang' type evasive maneuver. Author

(NASA-TM-80606) Avail: NTIS HC A02/MF A01 CSCL 09F

A computer oriented time code designed for users with various time resolution requirements is presented. It is intended as a time code for spacecraft and ground applications where direct code compatibility with automatic data processing equipment is of primary consideration. The principal features of this time code are: byte oriented format, selectable resolution options (from seconds to nanoseconds); and long ambiguity period. The time code is compatible with the new data handling and management concepts such as the NASA End-to-End Data System and the Telemetry Data Packetization format. M.M.M.

(NASA-CR-161368) Avail: NTIS HC A11/MF A01 CSCL 22B

From the control point of view, spacecraft are classified into two main groups: those for which the spacecraft is fully defined before the control system is designed; and those for which the control system must be specified before certain interchangeable parts of a multi-purpose spacecraft are selected for future missions. Consideration is given to both classes of problems. M.M.M.

N80-16093*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
EFFECTS OF SECONDARY YIELD PARAMETER VARIATION ON PREDICTED EQUILIBRIUM POTENTIAL OF AN OBJECT IN A CHARGING ENVIRONMENT
Carolyn K. Purvis 1979 21 p refs Presented at the Ann. Conf. on Nucl. and Space Radiation Effects, Santa Cruz, Calif., 16-20 Jul. 1979; sponsored by IEEE
(NASA-TM-79299; E-117) Avail: NTIS HC A02/MF A01 CSCL 22B

The sensitivity of predicted equilibrium potential to changes in secondary electron yield parameters was investigated using MATCHG, a simple charging code which incorporates the NASCAP material property formulations. The equilibrium potential was found to be a sensitive function of one of the two parameters specifying secondary electron yield due to proton impact and of essentially all the parameters specifying yield due to electron impact. The information on the electron generated secondary yield parameters was discovered to be obtainable from monoenergetic beam charging data if charging rates as well as equilibrium potentials are accurately recorded. A.W.H.

COMPUTED VOLTAGE DISTRIBUTIONS AROUND SOLAR ELECTRIC PROPULSION SPACECRAFT
N. John Stevens 1979 20 p refs Presented at 14th Intern. Conf. on Elec. Propulsion, Princeton, N.J., 30 Oct. - 1 Nov. 1979; sponsored by AIAA and DGLR
(NASA-TM-79286; E-225) Avail: NTIS HC A02/MF A01 CSCL 22B

The NASA Charging Analyzer Program is used to conduct preliminary computations of the voltage distributions around such large spacecraft in geomagnetic substorm environments at geosynchronous altitudes. Both a standard operating voltage (+ or - 150 volts on solar arrays) and direct-drive (+1200 volts on arrays) configurations are considered. Thruster-off simulations are computed for both operating voltage configurations while the effect of simulated thruster-on conditions are evaluated only for direct-drive configuration. These simulated thruster-on conditions are evaluated only for direct-drive configuration. These simulated thruster operations appear to alleviate surface charging. M.M.M.

ELECTRIC PROPULSION FOR NEAR-EARTH SPACE MISSIONS Final Report, Feb. 1978 - Apr. 1979
C. H. Terwilliger and W. W. Smith Jan. 1980 206 p
(Contract NAS3-21346)
(NASA-CR-159735; D180-25475-1) Avail: NTIS HC A10/MF A01 CSCL 21C

A set of missions was postulated that was considered to be representative of those likely to be desirable/feasible over the next three decades. The characteristics of these missions, and their payloads, that most impact the choice/design of the requisite propulsion system were determined. A system-level model of the near-Earth transportation process was constructed, which incorporated these mission/system characteristics, as well as the fundamental parameters describing the technology/performance of an ion bombardment based electric propulsion system. The model was used for sensitivity studies to determine the interactions between the technology descriptors and program costs, and to establish the most cost-effective directions for technology advancement. The most important factor was seen to be the costs associated with the duration of the mission, and this in turn makes the development of advanced electric propulsion systems having moderate to high efficiencies (> 50 percent) at intermediate ranges of specific impulse (approximately 1000 seconds) very desirable. UPPER STAGES UTILIZING ELECTRIC PROPULSION
David C. Byers 1980 21 p refs Presented at the JANNAF Propulsion Meeting, Monterey, Calif., 11-13 Mar. 1980
(NASA-TM-81412; E-330) Avail: NTIS HC A02/MF A01 CSCL 21C

The payload characteristics of geocentric missions which utilize electron bombardment ion thruster systems are discussed. A baseline LEO to GEO orbit transfer mission was selected to describe the payload capabilities. The impacts on payloads of both mission parameters and electric propulsion technology options were evaluated. The characteristics of the electric propulsion thrust system and the power requirements were specified in order to predict payload mass. This was completed by utilizing a previously developed methodology which provides a detailed thrust system description after the final mass on orbit, the thrusting time, and the specific impulse are specified. The impact on payloads of total mass in LEO, thrusting time, propellant type, specific impulse, and power source characteristics was evaluated. A.W.H.

PARTICLE SIZE MEASUREMENTS IN SOLID PROPELLANT ROCKET EXHAUST PLUMES Final Report, 11 Jul. 1977 - 30 Jun. 1978
Kenneth E. Harwell and W. Michael Farmer 30 Jun. 1978 47 p
(Contract N00174-77-C-0234)
(AD-A073556) Avail: NTIS HC A03/MF A01 CSCL 21/9

Particle sizing interferometer measurement of particle size distributions, velocity and number density in samples of rocket propellant exhaust is described. Signal visibility and scattered intensity for individual particles were measured for a nominal size range of 0.3 to 6 micrometers. Calibration tests of the instrument were obtained by firing small propellant samples into a 20 cu cm chamber and comparing the measured particle size distributions with those obtained from estimates using multiple wavelength transmissometers and a commercial optical particle counter. Particle sizing interferometer estimates of particle size distributions and number densities required the development of models which could account for sample space dependence on particle size and illuminating fringe contrast variation. Results obtained by using these models on particle size data from calibration and rocket motor test firings show the need for well-controlled insitu perturbationless particle size measuring techniques for hostile environments. DETERMINATION OF WATER SOLUBILITY IN ORGANIC LIQUIDS
C. H. Hunter and C. B. Honaker Jun. 1979 10 p refs Presented at 34th Northwest Regional Meeting of the Am. Chem. Soc., Richland, Wash., 13 Jun. 1979
(Contract EY-77-C-06-1030)
(RHO-SA-113; CONF-790666-5) Avail: NTIS HC A02/MF A01

It is necessary to determine the solubility of water in organic liquids such as cyclohexanone, when the amount of dissolved water would affect the extractive power of the organic liquid. Methods previously used to determine the solubility of water in organic liquids include titration, gas chromatography and refractive index measurements. Use of a tritium tracer is an easier and more accurate method. The limits of detection are lower and the dynamic range is larger. The method in this study determines the uptake of water in cyclohexanone by using a tritium tracer. Samples are spiked with tritiated water and aliquots of the organic phase are counted by liquid scintillation. The experimental procedure is described and results are discussed. DOE

NOVEL APPROACHES FOR ALLEVIATION OF ELECTRICAL HAZARDS OF GRAPHITE-FIBER COMPOSITES
Kumar Ramohalli 15 Oct. 1979 47 p refs
(Contract NAS7-100)
(NASA-CR-162683; JPL-Pub-79-63) Avail: NTIS HC A03/MF A01 CSCL 11D

Four basically different approaches were considered: gasification of fibers, retention in the matrix, clumping to prevent entrainment, and electrical insulation of fibers. The techniques used to achieve them are described in some detail. These involved surface treatment of fibers to improve the wettability of fibers and coating the fibers with the selected substances before laying them up for composite fabrication. Thermogravimetric analyses were performed on the plain and treated fibers in inert (nitrogen, argon) and reactive (air) atmospheres. The treated fibers embedded in epoxy were ignited in a Bunsen flame to determine the efficiency of these treatments. A simple apparatus was assembled to detect the time for the first short circuit (in a typical electrical circuit) when exposed to the combustion products from a graphite fiber composite fire. The state-of-the-art and treated fibers cast in typical epoxy were burned and ranked for potential success. It was inferred that the gasification schemes appear promising when reduction or oxidation is tried. It was also found that some very promising candidates were available for the clumping and for the electrical insulation of fibers. A.R.H.

FRACTURE MODES OF HIGH MODULUS GRAPHITE/EPOXY ANGLEPLIED LAMINATES SUBJECTED TO OFF-AXIS TENSILE LOADS
J. H. Sinclair 1980 22 p refs Presented at 35th Ann. Conf. of the Reinforced Plastics/Composites Inst., New Orleans, 4-8 Feb. 1980; sponsored by Soc. of Plastics Ind.
(NASA-TM-81405; E-319) Avail: NTIS HC A02/MF A01 CSCL 11D

Angelplied laminates of high modulus graphite fiber/epoxy were studied in several ply configurations at various tensile loading angles to the zero ply direction in order to determine the effects of ply orientations on tensile properties, fracture modes, and fracture surface characteristics of the various plies. It was found that fracture modes in the plies of angleplied laminates can be characterized by scanning electron microscope observation. The characteristics for a given fracture mode are similar to those for the same fracture mode in unidirectional specimens. However, no simple load angle range can be associated with a given fracture mode. Author

EFFECT OF TEMPERATURE ON COMPOSITE SANDWICH STRUCTURES SUBJECTED TO LOW VELOCITY IMPACT Final Report
Avva V. Sharma Feb. 1980 34 p refs
(Grant NsG-1296)
(NASA-CR-162718) Avail: NTIS HC A03/MF A01 CSCL 11D

The effect of low velocity projectile impact on sandwich-type structural components was investigated. The materials used in the fabrication of the impact surface were graphite-, Kevlar-, and boron-fibers with appropriate epoxy matrices. The testing of the specimens was performed at moderately low- and high-temperatures as well as at room temperature to assess the impact-initiated strength degradation of the laminates. Eleven laminates with different stacking sequences, orientations, and thicknesses were tested. The low energy projectile impact is considered to simulate the damage caused by runway debris, the dropping of the hand tools during servicing, etc., on the secondary aircraft structures fabricated with the composite materials. The results show the preload and the impact energy combinations necessary to cause catastrophic failure in the laminates tested. A set of faired curves indicating the failure thresholds is shown separately for the tension-and compression-loaded laminates. The specific-strengths and -modulii for the various laminates tested are also given. A.R.H.

MANUFACTURING PROCESSES FOR FABRICATING GRAPHITE/PMR 15 POLYIMIDE STRUCTURAL ELEMENTS Contractor Report, Aug. 1977 - Feb. 1979
C. H. Sheppard, J. T. Hoggatt, and W. A. Symonds Feb. 1979 295 p
(Contract NAS1-15009)
(NASA-CR-159129; D180-20545-2) Avail: NTIS HC A13/MF A01 CSCL 11D

Investigations were conducted to obtain commercially available graphite/PMR-15 polyimide prepreg, develop an autoclave manufacturing process, and demonstrate the process by manufacturing structural elements. Controls were established on polymer, prepreg, composite fabrication, and quality assurance. Successful material quality control and processes were demonstrated by fabricating major structural elements including flat laminates, hat sections, I beam sections, honeycomb sandwich structures, and molded graphite reinforced fittings. Successful fabrication of structural elements and simulated section of the space shuttle aft body flap shows that the graphite/PMR-15 polyimide system and the developed processes are ready for further evaluation in flight test hardware. INCREASED FRACTURE TOUGHNESS OF GRAPHITE-EPOXY COMPOSITES THROUGH INTERMITTENT INTERLAMINAR BONDING Final Report, Nov. 1978 - Oct. 1979
David K. Felbeck and Li-Chung Jea Jan. 1980 36 p refs
(Grant NGR-23-005-528)
(NASA-CR-159198) Avail: NTIS HC A03/MF A01 CSCL 11D

Intermittent interlaminar bonding, which can lead to a large increase in the fracture surface area, was achieved through the introduction of thin perforated Mylar between the layers of a multi-layer continuous-filament graphite-epoxy composite. For the best optimum condition included in this study, fracture toughness was increased from about 100 kJ/sq m for untreated specimens to an average of about 500 kJ/sq m, while tensile strength dropped from 500 MPa to 400 MPa, and elastic modulus remained the same at about 75 GPa. An approximate analysis is presented to explain the observed improvement in toughness. A.R.H.

N80-16107*# National Aeronautics and Space Administration, Lewis Research Center, Cleveland, Ohio.
PREDICTION OF FIBER COMPOSITE MECHANICAL BEHAVIOR MADE SIMPLE
C. C. Chamis 1980 26 p refs Presented at the 35th Ann. Conf. of the Reinforced Plastics/Composites Inst., New Orleans, 4-8 Feb. 1980; sponsored by the Soc. of Plastics Ind.
(NASA-TM-81404; E-331) Avail: NTIS HC A03/MF A01 CSCL 11D

The elastic properties and failure stresses of angleplied fiber composite laminates were determined using a pocket calculator. The procedure uses simple equations and appropriate graphs of elastic properties versus angle plies, and can handle all types of fiber composites including hybrids. The versatility and generality of the method is illustrated in several step-by-step numerical examples. A.R.H.

SINTERING KINETICS OF PURE AND DOPED BORON CARBIDE
R. G. Lange, Z. A. Munir, and J. B. Holt 11 Jun. 1979 12 p refs Presented at the 5th Intern. Conf. on Sintering and Related Phenomena, Notre Dame, Ind., 18 Jun. 1979
(Contract W-7405-eng-48)
(UCRL-82515; CONF-790682-3) Avail: NTIS HC A02/MF A01

The sintering of pure and doped boron carbide was investigated over the temperature range 1898 K to 2380 K and at additive levels ranging from 0.75 to 10.0 percent. The addition of 0.75 and 3.8 wt percent of AlF3, Ni, Fe, and Cu deactivated the sintering of B4C at all temperatures. In contrast, the addition of 10.0 wt percent these additives resulted in enhanced shrinkage in B4C for the temperatures 1898 K and 2133 K. At the highest temperature, 2380 K, the addition of 10.0 wt percent AlF3 was the only case where enhanced shrinkage was observed. In this case, X-ray analysis showed the formation of a B12C2Al compound and the release of fluorine. These results are interpreted in terms of a grain-boundary diffusion process for pure and doped B4C. DOE

PREPARATION OF FIBER REINFORCED TITANIUM DIBORIDE AND BORON CARBIDE COMPOSITE BODIES
L. R. Newkirk, R. E. Riley, H. Sheinberg, F. A. Valencia, and T. C. Wallace 1979 11 p refs Presented at the Intern. Conf. on Chem. Vapor Deposition, Los Angeles, 14 Oct. 1979
(Contract W-7405-eng-36)
(LA-UR-79-969; CONF-791017-3) Avail: NTIS HC A02/MF A01

A process is described for uniformly infiltrating woven carbon cloth with either titanium diboride or boron carbide at reduced pressure (15 to 25 torr). The effects of deposition temperature on the uniformity of penetration and on coating rate are described for temperatures from 750 to 1000 C and deposit loadings from 20 to 43 volume percent. For the boron carbides, boron composition is discussed and evidence is presented suggesting that propene is the dominant rate controlling reactant. DOE

ENVIRONMENTAL PARTICULATES: CHARACTERIZATION BY HELIUM PLASMA AND ELUCIDATION OF FORMATION PROCESSES Ph.D. Thesis
Christopher Francis Bauer 1979 343 p
Avail: Univ. Microfilms Order No. 7928503

An evolved gas analysis/emission spectrometer system capable of identifying inorganic compounds at trace levels in solid samples, especially environmental particulates, is described. Identification of a given compound is based on the coincident observation of its metal and nonmetal components at its temperature of vaporization. This coincidence exists for the pure halide, sulfide, and sulfate salts of Cd, Hg, Pb, and Zn. In real samples, however, a number of obstacles may hamper identification, most importantly, chemical reactions in the sample which alter the identity of compounds before vaporization. Nevertheless, most of the compounds, when vaporized from a silica matrix, retained the coincidence between metal and nonmetal, despite the fact that reactions did occur. Dissert. Abstr.

HEAVY HYDROCARBONS FROM COAL GASIFICATION VAPOR PRESSURES AND DEW POINT Ph.D. Thesis
Albert Brian Macknick 1979 110 p
Avail: Univ. Microfilms Order No. 8000429

Experimental vapor pressure data at near-ambient temperatures were measured for seven heavy hydrocarbons. Semitheoretical methods are recommended for extrapolating the data to higher temperatures. Because it is not always feasible economically to determine experimentally all vapor pressure data required, a group contribution method is presented which gives parameters for a vapor pressure equation, where all parameters are obtained from molecular structure only. Techniques are presented which allow classification of heavy hydrocarbon mixtures so that vapor pressures and molecular weights needed for dew point calculations can be estimated with a minimum amount of experiment effort. A computer program is used to predict conditions for two tars obtained from coal gasification pilot plants. Dissert. Abstr.

N80-16112 California Univ., Berkeley.
MASS TRANSFER CONTROLLED REACTIONS IN PACKED BEDS AT LOW REYNOLDS NUMBERS Ph.D. Thesis
Peter S. Fedkiw 1979 254 p
Avail: Univ. Microfilms

Mass-transfer data were experimentally taken in a transport controlled, flow-through porous electrode to test the theoretical calculations and to provide data presently unavailable for deeper beds. It was found that the sinusoidal PCT model could not fit the data of this work or that available in the literature. However, all data could be adequately described by a model which incorporates a channeling effect. The bed was successfully modeled as an array of dual sized straight tubes. Dissert. Abstr.

THE DEVELOPMENT AND UTILIZATION OF INELASTIC ELECTRON TUNNELING SPECTROSCOPY AS A TOOL FOR INVESTIGATING FUNDAMENTAL CATALYTIC PROCESSES Ph.D. Thesis
Howard Edwin Evans 1980 270 p
Avail: Univ. Microfilms Order No. 8002586

A diverse number of reactant/catalyst systems were investigated utilizing inelastic electron tunneling spectroscopy (IETS) to probe the vibrational structures of the various surface species. These studies include observation of an ethoxide-to-acetate transformation above 470 K for ethanol on alumina, demonstrating that IETS effectively monitors surface reactions. Characterization of surface acetates formed on alumina is obtained via analysis of IET spectra, as is information on the initial

adsorption mechanism for each species. Results obtained for ethanol adsorption on alumina-supported silver particles extend the use of IETS into areas of supported metal catalysis. The IETS technique was also used to characterize the structure of Zr(BH4)4 supported on aluminum oxide. Dissert. Abstr.

EXPERIMENTAL AND THEORETICAL INVESTIGATION OF ETHYLENE OXIDATION IN A FIXED-BED REACTOR
Ph.D. Thesis
Stephen Carl Paspek, Jr. 1980 144 p
Avail: Univ. Microfilms Order No. 8002621

The intrinsic kinetics of ethylene oxidation, in excess oxygen, over supported platinum catalyst was determined in a spinning basket-type gradientless reactor. The same catalyst was then introduced into both adiabatic and non-adiabatic fixed-bed reactors. Using a mixture of ethylene and oxygen as the reactor feed, the behavior of both reactors was experimentally determined over a wide range of operating conditions. Overall conversions, as well as axial temperature profiles were recorded. Employing the most accurate model, predictions of experimental reactor behavior were made, and the accuracy of the predictions was determined by subsequent experimentation. Results indicate that a one-dimensional two-phase model, including solid conduction, can accurately predict the behavior of this experimental fixed-bed reactor system for a variety of operating conditions.
Dissert. Abstr.

THE REDUCTION OF SILICA AND MULLITE IN HYDROGEN
Ph.D. Thesis
Chung-I Chen 1979 185 p
Avail: Univ. Microfilms Order No. 8001706

A theory was developed to deal with kinetics, thermodynamics, and mass transport phenomena simultaneously for reactions which generate gaseous products. The reaction of fused silica with hydrogen was investigated using this theory. For reactions controlled by product transport, the partial pressures of gaseous reactants and products were assumed to be in equilibrium at the reaction surface with the transport rate of the gaseous products proportional to the equilibrium partial pressures. The thermodynamic properties, the transport properties, and the kinetic model were solved by relating the equilibrium constant and mass transfer equation. Dissert. Abstr.

CATALYSTS FOR POLYIMIDE FOAMS FROM AROMATIC ISOCYANATES AND AROMATIC DIANHYDRIDES Patent
Salvatore R. Riccitiello, Paul M. Sawko, and Carlos A. Estrella, inventors (to NASA) Issued 4 Dec. 1979 5 p Filed 24 Feb. 1978 Supersedes N78-221156 (16 - 13, p 1674)
(NASA-Case-ARC-11107-1; US-Patent-4,177,333; US-Patent-Appl-SN-883961; US-Patent-Class-521-124; US-Patent-Class-521-125; US-Patent-Class-521-127; US-Patent-Class-521-157; US-Patent-Class-528-73) Avail: US Patent and Trademark Office CSCL 07D

Polyimide foam products having greatly improved burn-through and flame-spread resistance are prepared by the reaction of aromatic polyisocyanates with aromatic dianhydrides in the presence of metallic salts of octoic acid. The salts, for example stannous octoate, ferric octoate and aluminum octoate, favor the formation of imide linkages at the expense of other possible reactions.

NITROGEN DIOXIDE VAPOR PENETRATION OF CHLORO-BUTYL RUBBER SCAPE UNDER OPERATIONAL CONDITIONS
Thomas A. Schehl and Thomas W. Beall Feb. 1980 78 p refs
(NASA-TP-1605) Avail: NTIS HC A05/MF A01 CSCL 07D

Operational self contained atmospheric protective ensembles (SCAPE suits) and fabric from the suits were subjected to a series of tests designed to determine the amount of exposure a wearer of the suit would receive if a spill of the hypergolic oxidizer nitrogen tetroxide (N2O4) should occur nearby. The results of these tests show that a wearer of a 'stock' SCAPE suit equipped with a standard liquid air pack, if exposed to a spill resulting in a 26 percent increase of oxidizer in the surrounding atmosphere, will experiment no detectable concentration of nitrogen dioxide (NO2) inside the suit for 15 minutes. Thereafter, the NO2 concentration within the suit will increase for 35 minutes at a rate of 0.07 ppm per minute and then at a gradually decreasing rate until an equilibrium concentration of 3.4 ppm is attained after 100 minutes. Momentary increases of as much as 1.6 ppm can be expected if the wearer were to rise quickly from a squatting position, but the additional NO2 would be dissipated within three minutes. The effect of liquid and vapor N2O4 and of liquid monomethylhydrazine on permeation rates and tensile strength of the SCAPE suit fabric was also investigated. Author

A NUMERICAL MODEL OF HIGH INTENSITY CONFINED HYDROCARBON FLAMES
H. A. Arbib, Y. Goldman, J. B. Greenberg, and Y. M. Timnat Oct. 1978 65 p refs
(TAE-322) Avail: NTIS HC A04/MF A01

A computer program was developed for predicting flow field properties and species concentration distributions in side an axisymmetrical combustion chamber. A complex combuster geometry was considered, with an initial diffuser with divergence half angle of 45 degrees, and a short tunnel followed by a sudden expansion, in order to produce a strong recirculating pattern to stabilize the flame. The fuel (kerosene) and oxidant (air) emerged, premixed and in gaseous form from the central injection nozzle. A two equation model of turbulance was employed, and the complex kenetics of kerosene-air combustion by a three step global mechanism, for hydrocarbon attack, CO oxidation, and water formation are described. R.C.T.

COMBUSTION OF MULTICOMPONENT FUEL DROPLETS. Final Report
H. S. Homan. Jul. 1979. 28 p. refs.
(Contract EC-77-S-02-4449)
(COO-4449-2). Avail: NTIS. HC A03/MF A01.

The vaporization and burning of liquid fuel droplets which contain more than one chemical component were investigated. The prediction of the transient rate of changes in chemical composition of multi-component liquid fuel droplets during vaporization and burning in convective flow was considered. A model is provided of droplet burning which is more relevant to droplet vaporization and combustion in fuel sprays than the droplet combustion models which assume spherical symmetry, single-component fuel, and constant droplet properties. The model is expected to impact the models of combustion in diesel engines, gas turbines, and furnaces especially for the heavy shale and coal-derived fuels. DOE

THEORETICAL STUDY OF A REACTION-DIFFUSION MODEL FOR FLAME PROPAGATION IN A GAS. Ph.D. Thesis
S. S. Lin. Jul. 1979. 114 p. refs.
(Contract W-7405-eng-48)
(LBL-9487). Avail: NTIS. HC A06/MF A01.

Assuming the existence of a positive ignition temperature, it was proven that, for an arbitrary Lewis number, (1) there is a unique flame front associated with each unburned gas state. When the Lewis number is one, the model equation can be reduced to a scalar reaction-diffusion equation. It was proven further that (2) if the initial gas states are close to a flame front, then the gas mixture evolves into the flame front at an exponential rate. In particular, each flame front is stable under finite amplitude perturbation. (3) For general initial gas states, the gas mixture evolves asympotically into a suitable combination of flame fronts. STABILITY STUDIES OF COAL LIQUIDS
F. R. Brown and F. S. Kam. Aug. 1979. 23 p. refs.
(PETC/TR-79/5). Avail: NTIS. HC A02/MF A01.

The aging characteristics of liquid products derived from the hydrogenation of coal were studied. Viscometric, spectrometric, ultimate analysis, solvent separations, and oxygen consumption measurements were employed to monitor the storage properties of the coal liquids under a variety of environmental conditions. Using viscosity measurements as the primary probe of changes in the stored samples, the rate of product degradation was found to be related to the initial viscosity of the sample, the storage temperature and the concentration of oxygen in the gaseous environment over the samples. Fractions of gross coal liquid samples obtained by solvent separation methods were monitored for their rates of oxygen consumption in order to more accurately determine those materials most susceptible to oxidation, and concurrent degradation of the product. The results show that coal liquids are very susceptible to oxidative degradation. DOE

DEVELOPMENT OF HIGH TEMPERATURE SUBTRACTIVE COLUMN AND CHROMATOGRAPHIC ANALYSIS OF HYDROCARBONS PRESENT IN DIESEL EXHAUST
Clarence J. Raible and D. E. Seizinger Dec. 1978 11 p refs
(BETC/RI-78/12) Avail: NTIS HC A02/MF A01

A high-temperature subtractive column was developed for distinguishing diesel fuel and exhaust hydrocarbons into two classifications, i.e., saturated and unsaturated hydrocarbons. Duplicate samples were collected with and without a subtractive column and subsequently analyzed by gas liquid chromatography to determine boiling range distribution of exhaust hydrocarbons. Comparison of the resulting chromatographic data permitted determination of hydrocarbon class as well as boiling range distribution. The analytical procedure was developed for classification of hydrocarbons in the range C7 to C22. The loss of saturated compounds within the subtractive column was a reproducible 6 percent over the analyzed hydrocarbon range. Compensation for losses during sample transfer was accomplished by including the transfer steps in the calibration procedure. DOE

HC A08/MF A01 CSCL 07D

Sea water pretreatment systems which precede reverse osmosis systems were studied. The systems studied include: (1) a baseline system which consisted of sand filtration followed by cartridge filtration and a carbon filter for chlorine removal ahead of the hollow fiber polyamide membrane; (2) a coagulation pretreatment system which consisted of an upflow sludge blanket precipitator followed by a polishing filter and cartridge filter, and a carbon filter for removal of chlorine ahead of the hollow fiber polyamide membrane; and (3) an in-line coagulation performed ahead of the base-line pretreatment system. The feed to all three systems was chlorinated/microscreened sea water. The pretreated effluent from systems one and two was used as feed to either a spiral wound thin film composite membrane or a hollow fiber polyamide membrane. System two and three provided water with acceptable plugging factors for feeding reverse osmosis systems. The economics of the three pretreatment systems were determined for a flow rate of four million gallons per day. GRA

FORMATION OF SUPERSATURATED ALLOYS BY ION IMPLANTATION AND PULSED-LASER ANNEALING Ph.D. Thesis
Syd Robert Wilson 1979 174 p
Avail: Univ. Microfilms Order No. 8000814

Supersaturated substitutional alloys formed by ion implantation and rapid liquid-phase epitaxial regrowth induced by pulsed-laser annealing were studied using Rutherford backscattering and ion channeling analysis. A series of impurities (As, Sb, Bi, Ga, In, Fe, Zn, Cu) were implanted into single-crystal (001) orientation silicon at does ranging from 1 x 10 to the 15th power/ sq cm to 1 x 10 to the 17th power sq cm. The

samples were subsequently annealed with a Q-switched ruby laser. Ion channeling analysis shows that laser annealing incorporates the Group 3 (Ga, In) and Group V (As, Sb, Bi) impurities into substitutional lattice sites at concentrations far in excess of the equilibrium solid solubility. Channeling measurements indicate the silicon crystal is essentially defect free after laser annealing. Dissert. Abstr.

CORROSION BEHAVIOR OF Ni IMPLANTED STEEL Ph.D. Thesis
Shashi Bhushan Agarwal 1979 306 p
Avail: Univ. Microfilms Order No. 8000248

The compositional, structural, and electrochemical properties of Ni-implanted 430 stainless steel were analyzed. The compositional analysis revealed a larger concentration of Ni on the surface than predicted by LSS theory. Also, an extensive radiation damage was observed in the implanted material in the form of entangled dislocation network. The extent of damage was found to increase with Ni concentration. Ion implantation was found to be accompanied by sputtering of the surface. A considerable roughening of the surface occurs which is highlighted by impurities and defects in the substrate. The electrochemical behavior of 430 stainless steel was considerably modified by Ni implantation. These modifications include changes in anodic behavior of 430 stainless steel and in passivation parameters of 430 stainless steel. Dissert. Abstr.

Molybdenum specimens of three different impurity levels (residual resistivity ratios of 60, 650 and 6320, respectively), irradiated in the Oak Ridge Research Reactor to a fast neutron fluence of 1 x 10 to the 21st power n/sq cm (E > 0.1 MeV) at ten different temperatures ranging from 220 to 900 C were studied using transmission electron microscopy (TEM), small-angle X-ray scattering (SAXS) and knoop microhardness measurements. The TEM results showed that the microstructure consisted of voids, black spots and loops, rafts and dislocation segments. All were present at the lower irradiation temperatures, while only voids and dislocation segments were present at the higher temperatures. SAXS experiments also indicated that voids formed in the specimens irradiated at temperatures ranging from 220 to 900 C. The TEM and SAXS results suggest that the possible threshold temperature of void formation is possibly as low as 150 C (0.15 T sub m) in molybdenum. Dissert. Abstr.

THE EFFECTS OF STRAIN RATE AND STRAIN HISTORY ON THE DYNAMIC BEHAVIOR OF METALLIC MATERIALS Ph.D. Thesis
Ming-Chuen Yip 1979 112 p
Avail: Univ. Microfilms Order No. 7928634

The constitutive equations for strain hardening (FCC metals and alloys) and strain softening-hardening metallic materials (BCC metals and alloys) were developed within the framework of the endochronic theory of viscoplasticity. The constitutive equation is applied to describe the cyclic hardening behavior of materials at a prescribed constant strain rate. The theoretical stress-strain relation for each cycle under total strain control is presented, and the peak stress of each cycle under different controlled total strain is obtained. Wave propagation of strain hardening materials with both prestraining and strain rate history effects was investigated. The strain-time profiles were obtained and are presented for comparison with experimental data. The difference between the constant total strain rate and the constant plastic strain rate is discussed. Dissert. Abstr.

SCANNING-ELECTRON-MICROSCOPE STUDY OF NORMAL-IMPINGEMENT EROSION OF DUCTILE METALS
William A. Brainard and Joshua Salik Jan. 1980 11 p refs
(NASA-TP-1609; E-085) Avail: NTIS HC A02/MF A01 CSCL 11F

Scanning electron microscopy was used to characterize the erosion of annealed copper and aluminum surfaces produced by both single- and multiple-particle impacts. Macroscopic 3.2 mm diameter steel balls and microscopic, brittle erodant particles were projected by a gas gun system so as to impact at normal incidence at speeds up to 140 m/sec. During the impacts by the brittle erodant particles, at lower speeds the erosion behavior was similar to that observed for the larger steel balls. At higher velocities, particle fragmentation and the subsequent cutting by the radial wash of debris created a marked change in the erosion mechanism. Author

STRESS CORROSION CRACKING EVALUATION OF MARTENSITIC PRECIPITATION HARDENING STAINLESS STEELS
T. S. Humphries and E. E. Nelson Jan. 1980 34 p refs
(NASA-TM-78257) Avail: NTIS HC A03/MF A01 CSCL 11F

The resistance of the martensitic precipitation hardening stainless steels PH13-8Mo, 15-5PH, and 17-4PH to stress corrosion cracking was investigated. Round tensile and c-ring type specimens taken from several heats of the three alloys were stressed up to 100 percent of their yield strengths and exposed to alternate immersion in salt water, to salt spray, and to a seacoast environment. The results indicate that 15-5PH is highly resistant to stress corrosion cracking in conditions H1000 and H1050 and is moderately resistant in condition H900. The stress corrosion cracking resistance of PH13-8Mo and 17-4PH stainless steels in conditions H1000 and H1050 was sensitive to mill heats and ranged from low to high among the several heats included in the tests. Based on a comparison with data from seacoast environmental tests, it is apparent that alternate immersion in 3.5 percent salt water is not a suitable medium for accelerated stress corrosion testing of these pH stainless steels. SOME CONSIDERATIONS OF THE PERFORMANCE OF TWO HONEYCOMB GAS PATH SEAL MATERIAL SYSTEMS
Robert C. Bill and Lawrence T. Shiembob 1980 29 p refs
To be presented at the Ann. Meeting of the Am. Soc. of Lubrication Engr., Anaheim, Calif., 5-8 May 1980 Prepared in cooperation with Army Aviation Research and Development Command, Cleveland, and Pratt and Whitney Aircraft Group, East Hartford, Conn.
(NASA-TM-81398; AVRACOM-TR-79-33; E-032) Avail: NTIS HC A03/MF A01 CSCL 11F

A standard Hastelloy-X honeycomb material and a pack aluminide coated honeycomb material were evaluated as to their performance as labyrinth seal materials for aircraft gas turbine engines. Consideration from published literature was given to the fluid sealing characteristics of two honeycomb materials in labyrinth seal applications, and their rub characteristics, erosion resistance, and oxidation resistance were evaluated. The increased temperature potential of the coated honeycomb material compared to the uncoated standard could be achieved without compromising the honeycomb material's rub tolerance, although there was some penalty in terms of reduced erosion resistance. ELASTIC AND PLASTIC STRAINS AND THE STRESS CORROSION CRACKING OF AUSTENITIC STAINLESS STEELS Final Report
F. P. Vaccaro, R. F. Hehemann, and A. R. Troiano Aug. 1979 133 p refs
(Contract EY-76-S-02-2576)
(COO-2576-9) Avail: NTIS HC A07/MF A01

The influence of elastic (stress) and plastic (cold work) strains on the stress corrosion cracking (SSC) of a transformable austenitic stainless steel was studied in several aqueous chloride environments. Initial polarization behavior was active for all deformation

conditions as well as for the annealed state. The development of a pseudo-passive (flawed) film leading to localized corrosion, occluded cells and SCC was indicated. The latter did not initiate during active corrosion regardless of the state of strain unless severe low temperature deformation produced a high percentage of martensite. Both elastic and plastic deformation increased the sensitivity to SCC when examined on the basis of percent yield strength. The corrosion potential, the critical cracking potential, and the potential at which the current changes from anodic to cathodic were essentially unaffected by deformation. Apparently the basic electrochemical parameters are independent of the bulk properties of the alloy and totally controlled by surface phenomena. DOE

IRRADIATION DAMAGE IN METALS PRODUCED BY 800-MeV PROTONS
R. D. Brown, W. F. Sommer, and W. V. Green Jul. 1979 14 p
(Contract W-7405-eng-36)
(LA-7939-MS) Avail: NTIS HC A02/MF A01

To allow irradiation of samples on a routine basis, a proton irradiation port (PIP) was constructed in beam line A at LAMPF. This port allowed a high damage-rate irradiation of metal foils several mils thick. Irradiations were completed on foils of aluminum, niobium, molybdenum, and vanadium to damage levels between 0.05 dpa and several dpa, the damage occurring at homologous temperatures above 0.5 T/sub m/. Disks were punched from the irradiated foils and thinned for TEM examination. No voids were observed in irradiated aluminum samples. Molybdenum samples showed a low density of cavities which were believed to be gas filled at these high temperatures. Vanadium samples showed a high density of irradiation-produced defects resulting from irradiation-injected impurities. Such defects have been reported previously in ion-irradiated vanadium. The nature of the damage produced is compared to that found at lower temperatures following neutron or ion bombardment. DOE

BIAXIAL CREEP-FATIGUE BEHAVIOR OF TYPE 316H STAINLESS STEEL TUBE
S. Majumdar Apr. 1979 31 p refs
(Contract W-31-109-eng-48)
(ANL-79-33) Avail: NTIS HC A03/MF A01

Biaxial creep-fatigue test data for Type 316 stainless steel tubes at 1100 F for use in high-temperature components in solar central receivers are presented. The specimens were subjected to constant internal pressure and fluctuating axial strain with and without hold times in tension as well as compression. The results show that internal pressure significantly affects diametral ratchetting and axial stress range. Axial tensile hold is found to be more damaging than axial compressive hold even under a biaxial state of stress. DOE

EFFECT OF HEAT TREATMENT ON THE ELEVATED TEMPERATURE TENSILE AND FRACTURE TOUGHNESS RESPONSE OF ALLOY 718
W. J. Mills Jun. 1979 55 p refs
(Contract EY-76-C-14-2170)
(HEDL-TME-78-98) Avail: NTIS HC A04/MF A01

The tensile and J/sub Ic/ fracture toughness behavior of Alloy 718 was characterized at room temperature, 427 C (800 F) and 538 C (1000 F). Two different heat treatments were used: the conventional (ASTM A637) treatment, and a modified heat treatment designed to improve the toughness of Alloy 718 base metal and weldments. The strength of the conventionally heat treated Alloy 718 was found to be slightly greater than that of the modified Alloy 718. The elastic-plastic J/sub Ic/ fracture toughness response of the modified Alloy 718 was found to be superior to the J/sub Ic/ behavior exhibited by the conventional material over the entire test temperature range. Metallographic and fractographic examinations of Alloy 718 fracture surfaces revealed that this increase in fracture resistance was related to the dissolution of Widmanstaetten precipitates during the high temperature solution anneal employed in the modified treatment. ILLUSTRATION OF TERNARY DIAGRAM SYNTHESIS-Mn-Ti-Fe AND Al-Ti-Fe

Larry Kaufman and D. Dew-Hughes 1979 27 p refs Presented at the Symp. on Calculation of Phase Diagrams and Thermocham., Milwaukee, 17 Sep. 1979 Prepared jointly with Brookhaven Natl. Lab., Upton, N.Y.

(Contract EY-76-C-02-0016)

(BNL-26392; CONF-790910-1) Avail: NTIS HC A03/MF A01

Alloys based on the CsCl compound phase TiFe exhibit unusual hydrogen storage capacity. Improvements of these properties were pursued by alloying in which the CsCl structure is retained. The conditions under which that can be accomplished can only be predicted if the ternary phase diagram X-Ti-Fe is known. The present paper illustrates iterative computation of the Al-Ti-Fe and Mn-Ti-Fe ternary systems synthesized from the component edge binaries which were previously characterized by the CALPHAD group. The first computations were checked experimentally and it was found that the Mn-Ti-Fe exhibited good predictability while Al-Ti-Fe did not. Thus a second computation of Al-Ti-Fe was carried out. The initial success of the Mn-Ti-Fe computation and failure of the Al-Ti-Fe calculation depended upon prediction of the trajectory of stable propagation of the TiFe-CsCl phase into the TiFe-X ternary system. INFLUENCE OF HEAT TREATMENT ON THE MICROSTRUCTURE AND MECHANICAL PROPERTIES OF ALLOY 718 BASE METAL AND WELDMENTS

W. J. Mills Jun. 1979 121 p refs

(Contract EY-76-C-14-2170)

(HEDL-TME-78-54) Avail: NTIS HC A06/MF A01

Light microscopy, thin foil, and surface replica electron microscopy revealed that the microstructure of this superalloy was sensitive to heat treatment and heat-to-heat variations. Use of a modified aging treatment resulted in a larger grain size and a more homogeneous microstructure than the conventional treatments. The morphology of the primary strengthening gamma phase was found to be finer and more closely spaced in the conventionally treated condition. Room and elevated temperature tensile testing revealed that the strength of the conventionally treated alloy was generally superior to that of the modified material. The modified aging treatment reduced the amount of Laves phase present in the weld zone. Room and elevated temperature tensile properties of the precipitation hardened weldments were relatively insensitive to heat treatment, suggesting that reduction in Laves phase from the weld zone had essentially no effect on tensile properties. As-welded GTA weldments exhibited lower strength levels and higher ductility values than heat-treated welds. DOE

COMPUTER SIMULATION OF THE MARTENSITE TRANSFORMATION IN A MODEL TWO-DIMENSIONAL BODY

S. Chen, A. G. Khachaturyan, and J. W. Morris, Jr. May 1979 7 p refs Presented at Intern. Conf. on Martensitic Transformation, Boston, 24 Jun. 1979

(Contract W-7405-eng-48)

(LBL-9346; CONF-7906103-1) Avail: NTIS HC A02/MF A01

An analytical model of a martensitic transformation in an idealized body is constructed and used to carry out a computer simulation of the transformation in a pseudo-two-dimensional crystal. The reaction is assumed to proceed through the sequential transformation of elementary volumes (elementary martensitic particles, EMP) via the Bain strain. The elastic interaction between these volumes is computed and the transformation path chosen so as to minimize the total free energy. The model transformation shows interesting qualitative correspondencies with the known features of martensitic transformations in typical solids. DOE

A STUDY OF THE PHOTODEGRADATION OF POLY (METHYL METHACRYLATE) Ph.D. Thesis

Mohamed Abouelezz 1979 105 p

Avail: Univ. Microfilms Order No. 8000749

A study was performed in order to examine the effects on the polymer of radiation from the ultraviolet, the visible, and the infrared regions of the spectrum and to identify the mechanism(s) of degradation induced by the radiation. It was concluded that a different or more complex mechanism is operative in the photodegradation of poly (methyl methacrylate) at increasing wavelengths of incident radiation than that proposed for irradiation with a 253.7 nm source. A combination of mechanism (e.g., combination unzipping superimposed on random scission) is probably operating at the higher wavelengths. Dissert. Abstr.

N80-16160 Case Western Reserve Univ., Cleveland, Ohio.

TRANSPORT PROPERTIES OF CHLOROSULFONATED BLOCK COPOLYMERS Ph.D. Thesis

Hoo Young Chung 1979 170 p

Avail: Univ. Microfilms Order No. 8001453

The sorption and diffusion behavior of water and dynamic mechanical properties under various humidities were determined

using solution chlorosulfonated ABA block copolymers (A = polystyrene; B = poly(ethylene-butene-1), a specially prepared sample of poly(ethylene-butene-1) comparable to the B midblock, and their subsequently ionized forms. The extent of chlorosulfonation, analyzed by X-ray fluorescence, ranged from zero to eight percent sulfur. The results are interpreted in terms of a model involving formation of dipole-dipole aggregates within the non polar hydrocarbon matrix. The formation of glassy polystyrene domains, which competes with polar aggregates, was found to have a profound effect on water sorption as well as dynamic mechanical properties. Dissert. Abstr.

N80-16161 American Univ., Washington, D. C.
AN OPTICAL INVESTIGATION OF THE CORRELATION BETWEEN MASS TRANSPORT AND MECHANICAL PROPERTIES OF STRAINED POLYMER FILMS Ph.D. Thesis
Joseph Cornelius Phillips 1979 165 p
Avail: Univ. Microfilms Order No. 8000762

The transport and mechanical relaxation behavior of low density polyethylene and polyvinylidene fluoride (PVF2) in ethyl acetate vapor were extensively investigated at 30 C for a range of strain levels and vapor pressures. Polyethylene in ethyl acetate vapor was found to exhibit conventional diffusion while PVF2 above its glass transition temperat rre of -38 C was found to exhibit Type II diffusion above a transition pressure, p, and conventional diffusion below p. These results tend to show that morphology, elastic and plastic deformations, and mechanical relaxation influence both conventional and nonconventional transport properties and that Type II diffusion may occur for polymer/vapor systems above the glass transition temperature. Dissert. Abstr.

N80-16162 Detroit Univ., Mich.
THERMAL STABILITY OF ISOCYANATE BASED POLYMERS Ph.D. Thesis
Panagiotis I. Kordomenos 1978 226 p
Avail: Univ. Microfilms Order No. 7922254

The thermal behavior of model compounds, as well as model polymers were examined. The kinetics of the initial stage of the decomposition of the model compounds (cleavage of urethane group, oxazolidone and isocyanurate rings) was measured by using an IR-ampoule technique that was developed for this purpose. The decomposition products of model oxazolidone and model isocyanurate compounds were analyzed. The thermal degradation of the model polymers was investigated by means of dynamic and isothermal TGA. It was found that comparative studies of the kinetics of decomposition of model compounds (where the kinetics of the selective cleavage of key groups is monitored) with the isothermal TGA measurements of the model polymer represent a new methodology suitable for the estimation of the thermal limits (weakest points) of the complex polymer molecules. Dissert. Abstr.

STRONG THIN MEMBRANE STRUCTURE Patent Application
Robert E. Frazer, inventor (to NASA) (JPL) Filed 21 Dec. 1979 24 p
(Contract NAS7-100)
(NASA-Case-NPO-14021-2; US-Patent-Appl-SN-106188) Avail: NTIS HC A02/MF A01 CSCL 11D

A continuous process is described for producing strong lightweight structures for use as solar sails for spacecraft propulsion by radiation pressure. A thin reflective coating, such as aluminum, is applied to a rotating cylinder. A nylon mesh, applied over the aluminum coating, is then coated with a polymerizing material such as a para-xylylene monomer gas to polymerize as a film bound to the mesh and the aluminum. An emissivity increasing material such as chromium or silicon monoxide is applied to the polymer film to disperse such material colloidally into the growing polymer film, or to the final polymer film. The resulting membrane structure is then removed from the cylinder. Alternately, the membrane structure can be formed by etching a substrate in the form of an organic film such as a polymide, or a metal foil, to remove material from the substrate and reduce its thickness. A thin reflective coating (aluminum) is applied on one side of the substrate, and an emissivity increasing coating is applied on the reverse side of the substrate. NASA

MECHANISMS OF LUBRICATION AND WEAR OF A BONDED SOLID LUBRICANT FILM
Robert L. Fusaro 1980 40 p refs Proposed for presentation at 35th Ann. Meeting of the Am. Soc. of Lubrication Engr., Anaheim, Calif., 5-8 May 1980
(NASA-TM-81396; E-296) Avail: NTIS HC A03/MF A01 CSCL 11H

To obtain a better understanding of how bonded solid lubricant films lubricate and wear (in general), the tribological properties of polyimide-bonded graphite fluoride films were studied (in specific). A pin-on-disk type of testing apparatus was used; but in addition to sliding a hemispherically tipped rider, a rider with a 0.95 mm diameter flat area was slid against the film. This was done so that a lower, less variable contact stress could be achieved. Two stages of lubrication occurred. In the first, the film supported the load. The lubricating mechanism consisted of the shear of a thin surface layer (of the film) between the rider and the bulk of the film. The second occurred after the bonded film had worn to the substrate, and consisted of the shear of very thin lubricant films between the rider and flat plateaus generated on the metallic substrate asperities. The film wear mechanism was strongly dependent on contact stress. M.M.M.

PHOSPHONITRILIC FLUOROELASTOMER COATED FABRICS FOR COLLAPSIBLE FUEL STORAGE TANKS Final Report, 1 Feb. 1978 - 30 Mar. 1979
Richard W. Sicka and George B. Mitchell Jul. 1979 78 p refs
(Contract DAAG46-78-C-0006; DA Proj. 1L1-63102-D-071)
(AD-A074824; AMMRC-TR-79-44) Avail: NTIS HC A04/MF A01 CSCL 13/4

This report describes the preparation of fuel resistant coated fabric materials that are serviceable at temperatures as low as -70 F. The coated fabric materials were made from a phosphonitrilic fluoroelastomer compound coated on nylon fabric. Efforts

were directed toward attainment of calenderable compounds and test evaluations of the coated fabric. High filler loaded materials proved to be better processable materials. These showed good diffusion rates with test fluids (TT-S-735, Type II and Fuel S). Even better diffusion rates were seen with Arctic diesel fuel. The low temperature flexibility of the vulcanizates and coated fabric was promising for PNF-200 compounds. The seam adhesion strength and the fabric-to-rubber adhesion need to be improved before utilization of this material in tank constructions. GRA

POLYURETHANE FOAM, 0.05 g/cm3 DENSITY Final Report
J. R. Fender Oct. 1978 17 p refs
(Contract EY-76-C-04-0613)
(BDX-613-1964-Rev) Avail: NTIS HC A02/MF A01

A process developed to meter and mix Rigifoam 6003-2 material on an automatic mixing machine gave a substantially improved yield over the batch-mixing process used in initial development work. It was shown that this process meets the necessary requirements for a high production yield. Previous evaluation of the Bendix Rigifoam 6003-2 foam system is discussed, as well as continued dimensional studies, long-term aging of material, and machine metering and mixing. DOE

CHARACTERIZATION OF HALTHANE POLYURETHANE ADHESIVES. 1: DYNAMIC MECHANICAL AND THERMAL PROPERTIES
D. Mark Hoffman Jun. 1979 26 p refs Presented at DOE Weapons Complex Ann. Adhesives Conf., Amarillo, Tex., 5 Jun. 1979
(Contract W-7405-eng-48)
(UCRL-82694; CONF-790668-2) Avail: NTIS HC A03/MF A01

The polyurethanes presented contain polyether-isocyanate soft segments that exhibit a low temperature secondary relaxation at 150 C. The lower molecular weight polyether isocyanate soft segments of 73 series adhesives have higher glass transition temperatures (-50 C) than the higher molecular weight polyether-isocyanate soft segments of 87 and 88 series adhesives (-70 C). The 73 series polyurethanes also show a weak peak in the loss modulus at about 100 C. The relaxation strength of the soft segment glass transition depends on the molecular structure of the hard segments. Chemically different hard segments produce adhesives with different shear storage modulus over the temperature range (5 x 10 to the 8th power Pa for 88 and 87 series adhesives and about 1 x 10 to the 6th power Pa for 73 series adhesives). POLYMER MATERIALS BASIC RESEARCH NEEDS FOR ENERGY APPLICATIONS. PROCEEDINGS OF A WORKSHOP RECOMMENDING FUTURE DIRECTIONS IN ENERGY-RELATED POLYMER RESEARCH
W. J. Macknight, E. Baer, and R. D. Nelson Aug. 1979 205 p refs Workshop held at Cleveland, 27-29 Jun. 1978 Sponsored by DOE and Massachusetts Univ.
(CONF-780643) Avail: NTIS HC A10/MF A01

The larger field covered in the workshop consists of (1) synthesis and characterization, (2) physical chemistry, (3) physics, and (4) engineering. The basic research needs in polymer materials related to energy are reported. The development of sophisticated instrumentation makes the task of molecular characterization possible on a level hitherto unattainable. Many of these instruments because of their size and complexity must of necessity be located at the DOE National Laboratories. The importance of personnel trained in the polymer field located at these facilities is emphasized. In the past there has been relatively little concerted polymer research within the energy community. This report attempts to describe the present situation and point out some needs and future research directions. DOE

PERFORMANCE OF ALTERNATE COATINGS IN THE ENVIRONMENT (PACE) Final Report
Joseph A. Bruno, John Keane, and Raymond E. F. Weaver 30 May 1979 245 p refs Sponsored in part by DOE Pennsylvania Dept. of Transportation, Harrisburg; American Iron and Steel Inst.; Federation of Societies for Coating Technology; Steel Plate Fabricators Association; and Naval Civil Engineering Labs.
(PB-300868/7; FHWA/PA-79/05) Avail: NTIS HC A11/MF A01 CSCL 11C

Anti-corrosion coatings and methods developed to meet environmental needs were selected by a consensus committee evaluated in five environments in comparison with a range of standard materials whose long-term performance had been established. Periodic evaluations show that none of the alternative pigmentations were superior to the red lead or chromate controls in conventional oil or alkyd vehicles, although several were promising. In various vinyl vehicles, however, these alternative pigments, including some inerts, are at least equal to red lead, probably due to an encapsulating effect. GRA

AUTOHYDROLYSIS FOR IMPROVING METHANE YIELD FROM FERMENTATION OF LIGNOCELLULOSE Ph.D. Thesis
William Frederick Owen 1979 209 p
Avail: Univ. Microfilms Order No. 8001985

Aqueous heat treatment without chemical addition (autohydrolysis) was investigated as a pretreatment method for physically separating lignocellulose constituents from the matrix, in order to improve bioconversion efficiency to methane in anaerobic fermentation systems. Oxidative and nonoxidative autohydrolysis treatments ranging from 150 to 250 C were evaluated for relative effect on representative complex lignocellulosics (white fir, corn stover, and bagasse) and individual components of lignocellulose (cellulose, hemicellulose, and lignin). Preliminary studies using peat and newsprint indicated that bioconversion efficiency could be improved by autohydrolysis pretreatment, but autohydrolysis decreased the bioconversion efficiency of agricultural residues which were relatively biodegradable before treatment. It is proposed that autohydrolysis treatment be limited to nonbiodegradable lignocellulosics such as woody residues or previously digested materials. Dissert. Abstr.

N80-16176 Brigham Young Univ., Provo, Utah.
THEORETICAL MODELING OF COAL AND GAS FIRED TURBULENT COMBUSTION AND GASIFICATION PROCESSES Ph.D. Thesis
Philip John Smith 1979 511 p
Avail: Univ. Microfilms Order No. 8000091

A one-dimensional computer code was developed for the analysis of pulverized coal combustors and entrained flow gasifiers. Emphasis was placed on the description of the coal reaction processes and the gas-particle interactions. An Adams-Moulton, predictor-corrector solution technique was successfully implemented in solving the differential equations involved in the system. A number of predictions have been made for different combustors and gasifiers operating under a variety of conditions. An axi-symmetric two dimensional computer code was developed for the analysis of turbulent gaseous fired diffusion flames and as a basis for coal fired systems. The combustion model uses local instantaneous complex chemical equilibrium. A probability density function approach is used to obtain mean gas phase properties. A number of predictions were made for both nonreacting and reacting flow systems. Dissert. Abstr.

AGGREGATED VECTORIAL MODEL OF PETROLEUM FLOW IN THE UNITED STATES
V. V. Krishnan and D. F. Cahn Mar. 1979 90 p refs
(Contract W-7405-eng-48)
(LBL-8874) Avail: NTIS HC A05/MF A01

An aggregated material-flow model is proposed for crude oil and its derivative products. Stages in petroleum flow where material conservation is expected are isolated from those where volumetric or identity changes can occur, and generic properties of petroleum and petroleum products that would assist in effective data validation are identified. The model provides a structural framework for organization and consolidation of the various data bases related to petroleum, and serves as a guide for analysis and enumeration of explicit semantic data interrelationships. The model is amenable to expansion into both transactional and more disaggregated representations. The material-flow model is intended as a preliminary step toward a coherent and comprehensive data structure to support monitoring, forecasting, and regulatory efforts in the energy field. The model is developed in the abstract; no attempt is made to test it using explicit data. DOE

PRELIMINARY ASSESSMENT OF THE PROSPECTS FOR USE OF REFUSE-DERIVED FUEL IN MARYLAND
W. C. Metz and J. Shyer Feb. 1979 82 p refs
(Contract EY-76-C-02-0016)
(BNL-51065) Avail: NTIS HC A05/MF A01

The deployment problems of refuse derived fuel (RDF) production in Maryland are examined. Problems experienced by the pyrolysis plant in Baltimore City and the resource recovery plant in Baltimore County are cited. Maryland's municipal solid waste problems are discussed with emphasis on the major components of the municipal solid waste stream, e.g., volume, composition, and location; collection methods used; present and long-range disposal methods; and regulations and ordinances. The generic social and legal constraints to RDF production are described. The problems of RDF technology deployment in Maryland, i.e., county and state RDF energy potential, institutional barriers to RDF production and use, remitting requirements for new RDF production and use facilities, water quality issues of RDF production and use, air quality issues of RDF production and use, and recommendations for initiating RDF production and use are discussed. DOE

CHEMICAL KINETICS IN LNG DETONATIONS
C. K. Westbrook and L. C. Haselman 14 Sep. 1979 27 p refs Presented at 7th Intern. Colloq. on Gas-Dynamics of Explosions and Reactive Systems, Gottingen, West Germany, 20 Aug. 1979 Revised
(Contract W-7405-eng-48)
(UCRL-82293-Rev-1; CONF-790828-1-Rev-1) Avail: NTIS HC A03/MF A01

The problem of detonability of vaporized mixtures of liquified natural gas and air is addressed, using a characteristic time analysis. Separate numerical models are used to treat the evolution of the blast wave produced by a charge of high explosive and the chemical ignition delay of the fuel-air mixture. These models are combined with experimental data to predict the amount of high explosive required to initiate a detonation of a stoichiometric mixture of methane and air, giving an estimate of 50 to 100 kg of high explosive in spherical geometry. The effects of minor constituents such as ethane and propane on methane-air detonability are examined, and the mechanism by which these minor constituents kinetically sensitize the fuel is discussed. ASSESSMENT OF ENVIRONMENTAL AND SAFETY PROBLEMS IN HYDROGEN ENERGY SYSTEMS
F. J. Edeskuty, J. R. Bartlit, and R. V. Carlson 1979 5 p refs
Presented at the Intern. Congress on Refrigeration, Venice, 23 Sep. 1979
(Contract W-7405-eng-36)
(LA-UR-79-583; CONF-790901-3) Avail: NTIS HC A02/MF A01

Safety problems associated with the use of hydrogen as a portable or transportable fuel are discussed along with mechanisms to ensure the proper design of equipment and techniques for its storage, shipment, and use. The most likely methods of shipment are gas transmission by pipeline and bulk transportation of hydrogen as a cryogenic liquid. While these are well developed, safety and technological problems still exist and include such issues as dispersion of hydrogen releases, behavior of hydrogen on combustion, and hydrogen embrittlement. Safe transportation and handling of hydrogen can be enhanced by uniformity of codes and regulations. Hydrogen use as a fuel is not totally benign from an environmental standpoint; however, the combination of production and end use is generally more acceptable for hydrogen than for alternative fuels. DOE

DEVELOPMENT STUDIES ON SELECTED CONVERSION OF SYNTHESIS GAS FROM COAL TO HIGH OCTANE GASOLINE Final Report
J. A. Brennan Oct. 1978 383 p refs
(Contract EX-76-C-01-2276)
(FE-2276-27) Avail: NTIS HC A17/MF A01

An exploratory, experimental process study was conducted on the direct conversion of coal derived synthesis gas to gasoline. Novel, proprietary catalysts were used; (these unique catalysts do not yield oxygenates and the hydrocarbons formed are limited in size to about C sub 11.) This new technology was compared with conventional Fischer-Tropsch. The experiments were conducted in micro reactor (10 cc catalyst capacity) and in bench-scale units (150 cc catalyst capacity). The bench-scale unit was used in both a fixed and fluid bed mode. The studies included effects of temperature, pressure and space velocity on catalyst performance, and catalyst activation, aging and regeneration. DOE

FIBER-REINFORCED PLASTIC-BONDED EXPLOSIVES
A. P. Torres and A. S. Vigil Oct. 1978 42 p refs
(Contract W-7405-eng-36)
(LA-7522-MS) Avail: NTIS HC A03/MF A01

Fiber reinforcement in plastic-bonded explosives was studied to determine the ability of fiber reinforcement to reduce munition main charge cracking under a severe thermal cycle. Two fiber reinforced plastic-bonded explosives, X-0308 (95 wt% RDX, 4.5 wt% Estane, 0.5 wt% polyethylene fibers) and X-0312 (95 wt% RDX, 3.5 wt% Estane, 1.5 wt% polyethylene fibers), were evaluated and compared against their nonfiber-reinforced homolog, X-0280 (95 wt% RDX, 5 wt% Estane). A thermal stress analysis was performed using TSAAS, a two-dimensional, finite element thermal and stress analysis code. Predictions corresponded closely with experimental results. The study demonstrated that fiber incorporation above 0.5 wt% did not improve resistance to cracking. DOE

VARIABLE MODULUS MODEL FOR INELASTIC FINITE ELEMENT ANALYSIS Ph.D. Thesis
Taha Daud Al-Shawaf 1979 141 p
Avail: Univ. Microfilms Order No. 8000269

A variable modulus modeling procedure for nonlinear analysis of soils is presented. The procedure accounts for stiffening behavior under volumetric strain, strain softening behavior under distortional strain, the influence of hydrostatic stress on shear strength, and the shear dilation effect. A numerical modeling process based on piecewise linear behavior (piecewise constant moduli) is used, without the use of analytical expressions for material properties. The modulus values are determined from the results of hydrostatic and triaxial tests. The theoretical basis of the method is presented, and the procedure for calculating the tangent moduli is described. Computational techniques for the state-determination problem and the linearization phase are developed and implemented in a general purpose computer program. Dissert. Abstr.

Details of a research study on shrinkage-compensating concrete for airport pavements are presented. A total of 53 slab-type prisms 1 foot square and 8, 12, 16, or 20 inches thick were subjected to shrinkage, cooling, and heating. Concrete compressive stresses induced by expansion were calculated, as well as residual compressive stresses after losses due to shrinkage and cooling. The residual concrete compressive stresses, coupled with results from previous field applications of shrinkage-compensating concrete, are used as a basis for recommendation of transverse joint spacings up to 200 feet. ON THE USE OF COHERENCE FUNCTIONS TO EVALUATE SOURCES OF DYNAMIC EXCITATION **c39**

Stanley Barrett *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 1 Sep. 1979 p 43-58 refs (For primary document see N80-16198 07-31)

(Contract NAS1-14370)

Avail: NTIS HC A09/MF A01 CSCL 20K

The use of coherence functions for identifying the relative contributions of multiple dynamic inputs to the measured vibration response of spacecraft components on a practical, complex structure was investigated. Data were generated by applying simultaneous vibratory and acoustic excitation to a test model (a modified Titan instrumentation truss). Up to three inputs were used. In some cases mutually coherent inputs were generated. A digital computer program was written to analyze the test data, using an approach based on iterative computational algorithms. The results showed that the coherence function technique was effective in identifying and evaluating sources of excitation, for both independent and coherent in futs. The effect of varying the number of data samples used in the necessary averaging process was briefly investigated. J.M.S.

STATUS OF CAVITY NOISE PHENOMENA MEASUREMENT AND SUPPRESSION ON THE B-1 AIRCRAFT **c05**

A. G. Tipton and C. H. Hodson *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt 1 Sep. 1979 p 59-66 refs (For primary document see N80-16198 07-16)

Avail: NTIS HC A09/MF A01 CSCL 20A

During the B-1 aircraft development, an extensive program of weapons bay cavity noise measurement and suppression studies was performed using wind tunnel models, flight test measurements, and aircraft design modifications. Substantial cavity noise reduction was demonstrated during flight test operations. The unsuppressed cavity noise level of 170 dB was reduced to values less than 150 dB with external retractable spoilers upstream of the cavity opening. J.M.S.

SPACE SHUTTLE SOLID ROCKET BOOSTER AFT SKIRT REENTRY NOISE INDUCED BY AN AERODYNAMIC CAVITY-FLOW INTERACTION **c16**

L. A. Schutzenhofer, P. W. Howard, W. W. Clever, and S. H. Guest *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 1 Sep. 1979 p 67-82 refs (For primary document see N80-16198 07-31)

Avail: NTIS HC A09/MF A01 CSCL 20A

High amplitude discrete frequency cavity induced noise was observed during wind tunnel testing of the reentry flight phase conditions of the solid rocket booster (SRB) of the space shuttle vehicle system. These wind tunnel tests were designed to acquire aerodynamic noise data for the development of vibroacoustic design and qualification test criteria for the SRB. The reentry trajectory characteristics of the SRB are random with the angle of attack varying from approximately 96 deg to 180 deg and with the dynamic pressure varying from approximately 360 to 1,020 lb/sq ft for a 95 percentile envelope for a Mach number of 3.5. The SRB model was a 2.8 percent scale model with all the external protuberances. It was tested with internal motor volumes of 5, 50, and 100 percent of the burnt-out SRB motor volume. Results of tests are given for two cavity volumes, i.e., 5 and 100 percent. Author

A SIMPLIFIED METHOD OF EVALUATING THE STRESS WAVE ENVIRONMENT OF INTERNAL EQUIPMENT **c39**

J. D. Colton and T. P. Desmond *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 1 Sep. 1979 p 89-96 refs (For primary document see N80-16198 07-31)

Avail: NTIS HC A09/MF A01 CSCL 20K

A simplified method called the transfer function technique (TFT) was devised for evaluating the stress wave environment in a structure containing internal equipment. The TFT consists of following the initial in-plane stress wave that propagates through a structure subjected to a dynamic load and characterizing how the wave is altered as it is transmitted through intersections of structural members. As a basis for evaluating the TFT, impact experiments and detailed stress wave analyses were performed for structures with two or three, or more members. Transfer functions that relate the wave transmitted through an intersection to the incident wave were deduced from the predicted wave response. By sequentially applying these transfer functions to a structure with several intersections, it was found that the environment produced by the initial stress wave propagating through the structure can be approximated well. The TFT can be used as a design tool or as an analytical tool to determine whether a more detailed wave analysis is warranted. R.E.S.

HIGH G PYROTECHNIC SHOCK SIMULATION USING METAL-TO-METAL IMPACT **c39**

Monty Bai and Wesley Thatcher *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 1 Sep. 1979 p 97-100 (For primary document see N80-16198 07-31)

Avail: NTIS HC A09/MF A01 CSCL 20K

A technique for simulating high g level pyrotechnic shocks is described and the results of applying the technique to obtain the MIL-STD-1540A shock spectrum with a maximum acceleration of 18,000g at 2,000 Hz are presented. Designing the resonant beam and plate on which the test unit is mounted, and generating a proper impulsive load on them, were the essentials of the technique. One dimensional stress wave and Euler equations were employed in the design. A metal pendulum hammer was used to generate the impulsive load. R.E.S.

BLAST FROM BURSTING FRANGIBLE PRESSURE SPHERES c39
E. D. Esparza and W. E. Baker. *In* Shock and Vibration Inform. Center. The Shock and Vibration Bull., Pt. 1, Sep. 1979, p. 127-139, refs (For primary document see N80-16198 07-31)
(Grant NsG-3008)
Avail: NTIS HC A09/MF A01 CSCL 20K

Laboratory experiments conducted to obtain incident overpressure data from frangible spheres pressurized with two different gases and a vapor are described. Glass spheres under internal pressure were purposely burst to obtain time histories of overpressure using side-on pressure transducers. A scaling law for pressure spheres bursting in free-air is derived and presented. This law is simplified and used to obtain a functional relationship for the non-dimensional blast parameters. Peak overpressure, arrival and duration times, and impulse data are presented for different initial conditions and blast source energies. These dimensionless data are also compared, wherever possible, with results of theoretical calculations and compiled data for Pentolite high-explosive. The scaled data are quite repeatable and show significant differences from blast waves generated by condensed high-explosives. R.E.S.

PREDICTION OF FRAGMENT VELOCITIES AND TRAJECTORIES c37
J. J. Kulesz, L. M. Vargas, and P. K. Moseley. *In* Shock and Vibration Inform. Center. The Shock and Vibration Bull., Pt. 1, Sep. 1979, p. 171-187, refs (For primary document see N80-16198 07-31)
(Contract NAS3-20497)
Avail: NTIS HC A09/MF A01 CSCL 20K

Analytical techniques are described which predict: (1) the velocities of two unequal fragments from bursting cylindrical pressure vessels; (2) the velocity and range of portions of vessels containing a fluid which, when the vessel ruptures, causes the fragment to accelerate as the fluid changes from the liquid to the gaseous phase; and (3) the ranges of fragments subjected to drag and lift forces during flight. Numerous computer runs were made with various initial conditions in an effort to generalize the results for maximum range in plots of dimensionless range versus dimensionless velocity. R.E.S.

A STATISTICAL LOOK AT MODAL DISPLACEMENT RESPONSE TO SEQUENTIAL EXCITATIONS c39
William J. Karena. *In* Shock and Vibration Inform. Center. The Shock and Vibration Bull., Pt. 2, Sep. 1979, p. 15-18, refs (For primary document see N80-16211 07-31)
Avail: NTIS HC A10/MF A01 CSCL 20K

The residual displacement response to a sequence of simple excitations separated by nearly equal time intervals is evaluated on a statistical basis. Mean plus three sigma responses are plotted as a function of the number of sequential excitations for a range of damping values. The curves are derived for parametric evaluation of the vibratory pointing error for a maneuvering spacecraft, but they can be applied to other sequential excitation problems where the residual displacement in a key mode is the response parameter of interest. K.L.

ON DETERMINING THE NUMBER OF DOMINANT MODES IN SINUSOIDAL STRUCTURAL RESPONSE c39
W. L. Hallauer, Jr. and A. Franck. *In* Shock and Vibration Inform. Center. The Shock and Vibration Bull., Pt. 2, Sep. 1979, p. 19-34, refs (For primary document see N80-16211 07-31)
(Grant NsG-1276)
Avail: NTIS HC A10/MF A01 CSCL 20K

The problem of using structural dynamic transfer function data to determine the number of vibration modes dominant in response at a given frequency is addressed. If two or more modes are closely spaced or if response is influenced strongly by distant modes, then the number of dominant modes may not be evident from examination of transfer function plots, and quantitative methods may be required. Two relatively simple methods are reviewed, and a more effective vector-fit method is described in detail. Applications of these methods are given with the use of numerically simulated transfer function data. K.L.

WHOLE-BODY VIBRATION OF HEAVY EQUIPMENT OPERATORS c54

D. E. Wasserman, W. C. Asburry, and T. E. Doyle *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 2 Sep. 1979 p 47-68 refs (For primary document see N80-16211 07-31)
Avail: NTIS HC A10/MF A01 CSCL 05H

A vibration field study was made of workers operating track-type tractors, scrapers, motor graders, loaders, backhoes, compactors, skidders, and dump trucks. Vibration data were obtained from the vehicle floor and manseat interface, as well as from the operator's knee, shoulder, and head. The vibration spectrum analysis indicates that for the different types of machines little difference could be attributed to the experience or body mass of the operator and that most of the higher level vibration occurred below the 4 to 8 Hz human body resonance band, much of it at less than 1 Hz. K.L.

SHOCK RESPONSE OF NON-LINEAR SYSTEMS **c39**
Kalman Peleg *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 2 Sep. 1979 p 145-157 refs (For primary document see N80-16211 07-31)
Avail: NTIS HC A10/MF A01 CSCL 20K

A model consisting of a mass between two preloaded nonlinear (cubic elasticity) springs and restrained by a Coulomb and viscous damper is proposed. An approximate quasi-harmonic solution of the nonlinear differential equation of motion of the model whereby both amplitude and phase are time dependent, enables a study of the motion during the first half cycle (pulse) after collision. Formulae are developed for calculating peak acceleration, rise time, pulse duration and maximum deflection.

These are compared with corresponding formulae of special cases for which exact solutions are known. Acceleration versus time pulses are classified in accordance to pulse shape, e.g., saw-tooth, halfsine and trapezoidal, as a function of system damping. Although the model is intended mainly for quantitative design in packaging engineering problems, it is suitable for studying general shock isolation problems as well. M.M.M.

STABILITY ANALYSIS AND RESPONSE CHARACTERISTICS OF TWO-DEGREE OF FREEDOM NONLINEAR SYSTEMS **c39**
M. Subudhi and J. R. Curreri *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 2 Sep. 1979 p 159-163 refs (For primary document see N80-16211 07-31)
Avail: NTIS HC A10/MF A01 CSCL 20K

The stability of a nonlinear two degree-of-freedom spring-mass system subjected to a sinusoidal exciting force is examined. The solution is perturbed to arrive at a set of coupled variational linear differential equations with periodic coefficients. Floquet theory is used to obtain a characteristic equation. The Routh-Hurwitz stability criterion is adopted to study the stable and unstable regions of the response curves. A computer program is developed to carry out the entire analysis. Extensive information regarding stable zones of the system response is described by means of nondimensional frequency-amplitude diagrams. The results are examined in terms of inferring dynamic response characteristics for sine sweep tests. Author

SHOCK SPECTRA DESIGN METHODS FOR EQUIPMENT-STRUCTURE SYSTEMS **c39**
James M. Kelly and Jerome L. Sackman *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 2 Sep. 1979 p 171-176 refs (For primary document see N80-16211 07-31)
(Contract DNA001-C-0233; Grant NSF ENG-77-05197)
Avail: NTIS HC A10/MF A01 CSCL 20K

An analytical method is developed whereby a simple estimate can be obtained of the maximum dynamic response of light equipment attached to a structure subjected to ground motion. The natural frequency of the equipment, modeled as an undamped single degree-of-freedom system, is considered to be close or equal to one of the natural frequencies of the undamped N degree-of-freedom structure. This estimate provides a convenient, rational basis for the structural design of the equipment and its installation. The approach is based on the transient analysis of tuned or slightly detuned equipment-structure systems in which the mass of the equipment is much smaller than that of the structure. The results obtained are simple estimates of the maximum acceleration and displacement of the equipment. A.R.H.

A COMPUTATIONAL MODEL DESCRIBING THE INITIATION OF SILVER ACETYLIDE-SILVER NITRATE EXPLOSIVE BY AN INTENSE LIGHT SOURCE **c28**
Floyd H. Mathews *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 2 Sep. 1979 p 177-191 refs Sponsored by DOE (For primary document see N80-16211 07-31)
Avail: NTIS HC A10/MF A01 CSCL 19A

The surface initiation of silver acetylide-silver nitrate explosive occurs when the explosive is exposed to irradiation produced by an electrical discharge through an array of tungsten wires, each surrounded by an air-filled Pyrex tube. The initiation process is modeled by first calculating the wire heating and subsequent arc breakdown. Then the arc energy is allowed to reradiate toward the explosive surface using a characteristic relaxation time. Finally, the thermal initiation of the explosive surface is modeled as the conductive transfer of heat through a surface layer of inert explosive which had previously been darkened by exposure to the sun. Initiation occurs when active explosive reaches a critical temperature. A number of unknown parameters are accommodated by normalizing the calculation to agree with the time delay before firing which was measured during a single experiment. A.R.H.

ANALOG DOUBLE INTEGRATION OF SHOCK PULSES **c39**
Kalman Peleg and Richard A. Lund (MTS Systems Corp., Minneapolis, Minn.) *In* Shock and Vibration Inform. Center The Shock and Vibration Bull., Pt. 2 Sep. 1979 p 209-217 refs (For primary document see N80-16211 07-31)
Avail: NTIS HC A10/MF A01 CSCL 20K

Conventional monitoring and evaluation in shock testing is based mainly on acceleration pulse recordings from a shock machine and a tested product. For product fragility boundary establishment, shock machine velocity change is either computed from drop height, measured by an optical velocity meter or single integration of the acceleration time pulse. An approach to acceleration transient analysis is described whereby a real-time double integrator circuit provides analog readout of velocity and displacement as well as acceleration. Absolute and relative velocity changes and displacements are obtained by means of consecutive integration of signals from acceleration transducers. Although an analog double integration circuit is featured, the applications also apply to digital double integration. Author

HOMOGENEOUS ALIGNMENT OF NEMATIC LIQUID

CRYSTALS BY ION BEAM ETCHED SURFACES
E. G. Wintucky, R. Mahmood, and D. L. Johnson 19 Oct. 1979 19 p refs Presented at 156th Meeting of the Electrochem. Soc., Los Angeles, 15-19 Oct. 1979
(NASA-TM-81378; E-283) Avail: NTIS HC A02/MF A01 CSCL 20L

A wide range of ion beam etch parameters capable of producing uniform homogeneous alignment of nematic liquid crystals on SiO2 films are discussed. The alignment surfaces were generated by obliquely incident (angles of 5 to 25 deg) argon ions with energies in the range of 0.5 to 2.0 KeV, ion current densities of 0.1 to 0.6 mA sq cm and etch times of 1 to 9 min. A smaller range of ion beam parameters (2.0 KeV, 0.2 mA sq cm, 5 to 10 deg and 1 to 5 min.) were also investigated with ZrO2 films and found suitable for homogeneous alignment. Extinction ratios were very high (1000), twist angles were small (< or = 3 deg) and tilt-bias angles very small (< or = 1 deg). Preliminary scanning electron microscopy results indicate a parallel oriented surface structure on the ion beam etched surfaces which may determine alignment. Author

To provide guidance for hydrofoil designers, an extensive operational evaluation was made of a computer-based lifting-surface theory for calculating hydrodynamic loading on hydrofoils in steady and unsteady motion in inviscid, subcavitating flow at finite depth. Both the numerical stability and the accuracy in comparison with model data were estimated. By use of an empirical correction, lift predictions can be made with an accuracy of about 15 to 20 percent, while pitching moment predictions are substantially less accurate. Determination of the accuracy was hindered by insufficient or imprecise data. Documentation for the computer program is given. Author (GRA)

JEFF(A) MIXED-FLOW MODEL FAN PERFORMANCE OPTIMIZATION Final Report
S. A. Lorenc Jun. 1979 120 p refs
(Contract N00014-78-C-0441)
(AD-A074571; ALRC-FD9630-001) Avail: NTIS HC A06/MF A01 CSCL 13/10

This model test program was conducted in order to improve the performance of the JEFF(A) Mixed-Flow Fan. Both rotor and housing changes were made to the existing model fan and tests were conducted in the ALRC Physics Laboratory. Rotor modifications consisted of varying blade length and narrowing the rotor width at the exit. Housing size was varied by changing axial and radial dimensions. The sensitivity of fan performance to IGV positioning was also determined for both flat and twisted vanes. Finally, full size fan performance was predicted for the best combination of housing and rotor. Recommendations are also made for further improvement of the Mixed-Flow Fan concept. GRA

HEAVY-SECTION STEEL TECHNOLOGY PROGRAM Quarterly Progress Report, Jan. - Mar. 1979
G. B. Whitman and R. H. Bryan Aug. 1979 122 p refs
(Contract W-7405-eng-26)
(NUREG-CR-0818; ORNL/NUREG/TM-324) Avail: NTIS HC A06/MF A01

Research related to all areas of the technology of the materials fabricated into thick-section primary-coolant containment systems of light-water-cooled nuclear power reactors is presented. The behavior and structural integrity of steel pressure vessels containing cracklike laws are considered. Current work is organized into six tasks: (1) program administration and procurement; (2) fracture mechanics analyses and investigations; (3) effect of high-temperature primary reactor water on the subcritical crack growth of reactor vessel steels; (4) investigations of irradiated materials; (5) pressure vessel investigations; and (6) thermal shock investigations. A user-oriented finite-element computer program for calculating mixed-mode stress-intensity factors (SIF's) for nozzle corner flaws of arbitrary shape is being developed. A method for estimating stable crack growth in fracture toughness specimens was developed and applied to the analysis of several sets of data. DOE

SAFETY OF LIQUID HYDROGEN IN AIR TRANSPORTATION
F. J. Edeskuty 1979 18 p refs Presented at the Hydrogen in Air Transportation Conf., Stuttgart, 10 Sep. 1979
(Contract W-7405-eng-36)
(LA-UR-79-1418; CONF-790942-1) Avail: NTIS HC A02/MF A01

The safety factors and problems associated with the use of liquid hydrogen as an aircraft fuel are discussed. The properties of liquid hydrogen are reviewed and their effect upon airline operations is reported. The effects include safety requirements for storage and refueling systems and safety devices for aircraft hangars and buildings in the close vicinity. Safety problems which need further research are addressed. These include the consequences of a hydrogen spill and dispersion, hydrogen combustion, and hydrogen disposal.

ENERGY AND MATERIALS FLOWS IN THE FABRICATION OF ALUMINUM PRODUCTS
R. M. Arons and A. M. Wolsky Aug. 1978 69 p refs
(Contract W-31-109-eng-38)
(ANL/CNSV-3) Avail: NTIS HC A04/MF A01

The aluminum fabrication process is described and energy use and efficiency for each process step is cited. It is concluded that the most effective approaches to energy conservation is the use of methods for waste heat reduction and recovery, reduction of scrap generation during processing, use of induction heating for both melting and heat treating, and use of alternative processing techniques that eliminate energy intensive intermediate steps. APPLICATION OF A DIFFUSION MODEL TO OXIDE SINTERING
C. D. Messelt, D. A. Stanley, and E. K. Landis, Jr. 1979 16 p refs
(PB-300399/3; BM-RI-8369) Avail: NTIS HC A02/MF A01 CSCL 11B

The application of a diffusion model to sintering rate data developed for lithium titanium ferrite was investigated. The data were obtained by sintering pressed pellets under identical conditions for various times up to 11 hours. Stereological measurements were made on polished sections, and sintering rates were calculated. A model for intermediate stage sintering was fitted to the stereological data. This procedure produces a method by which these type data are used to study the relative importance of volume and grain boundary diffusion under a variety of sintering conditions. GRA

MECHANICAL TUNNEL BORING PREDICTION AND MACHINE DESIGN Final Report
Levent Ozdemir and Fun-Den Wang Feb. 1979 225 p refs
(Grant NSF APR-77-04183)
(PB80-101660; EMI-427; NSF/RA-790161) Avail: NTIS HC A10/MF A01 CSCL 13B

Research efforts are described to obtain accurate data to verify previously developed equations for mechanical tunnel boring. Procedures pertinent to machine design and performance were also investigated. A laboratory indentation test procedure was designed to predict field boring performance. Extensive indentation tests were conducted in samples of three rock types, results of which confirmed the applicability of indentation tests as a reliable tool to predict disc cutting forces. Field boring data from

an active tunneling site indicate that indentation tests can be used as a means of accurately estimating field boring performance. GRA

EFFECT OF SUBBASE TYPE AND SUBSURFACE DRAINAGE ON BEHAVIOR OF CRC PAVEMENTS Interim Report, May 1971 - Dec. 1977
Jagat S. Dhamrait and Donald R. Schwartz May 1979 41 p refs
(PB80-101165; Physical Research-83; FHWA/IL/PR-083) Avail: NTIS HC A03/MF A01 CSCL 13B

As part of an extensive study conducted to determine the significant relationship between the behavior of CRC pavement and various design features, an evaluation was made of four types of subbase and three types of subsurface drainage systems. Deformation of the subbase due to loading and/or subbase erosion under severe climate and moisture conditions can cause severe pavement distress. The subsurface drainage system with longitudinal underdrains placed at the edge of the stabilized subbase was the most efficient in removing free water from beneath the pavement structure. GRA

A STUDY OF HIGHWAY EMBANKMENT CONSTRUCTION IN SOUTH CAROLINA MARSHLANDS Final Report
W. K. Humphries 31 May 1979 74 p refs Sponsored in part by South Carolina Dept. of Highways and Public Transportation and FHWA
(PB-300816/6; FHWA/SC-79/002) Avail: NTIS HC A04/MF A01 CSCL 13C

A site in Charleston, South Carolina was studied to determine practical alternatives to bridging over soft foundation soils. Many states with similar soil conditions to those evaluated at this site were contacted concerning their alternative solutions to bridging. A comparative cost study was made for the particular site in Charleston for several possible alternative solutions, and ecological effects of each were considered. It was found that the use of sand drains in combination with surcharging and geotechnical fabrics offer an alternative which is cost effective and sound engineering-wise. GRA

EFFECTIVENESS OF NEOPRENE SEALS IN PREVENTING CONCRETE PAVEMENT CONTRACTION JOINT DETERIORATION Final Report, 1973 - 1977
F. J. Bashore and A. W. Price Jul. 1979 32 p
(PB-300594/9; R-1122; FHWA/MI-79/2) Avail: NTIS HC A03/MF A01 CSCL 13B

Over 200 cores were taken from contraction joints sealed with compressible seals on 17 construction projects over a period of four years in order to determine the amount and rate of deterioration of the concrete at the bottom of the joint. Seal performance was rated, chloride content of concrete was determined, and drainability of base material was rated. Results indicate that the neoprene seals are performing well in preventing the entry of incompressibles but permit the entry of liquids into virtually all joints. The data indicate that most of the deterioration occurred during the first five years and shows little significant changes for the following years. Several modifications in design, construction, and maintenance of concrete contraction joints are suggested. GRA

DETERMINATION OF THE IN SITU PERMEABILITY OF BASE AND SUBBASE COURSES Final Report, 25 May 1976 - 31 May 1979
Lyle K. Moulton and Roger K. Seals May 1979 161 p refs
(Contract DOT-FH-11-9060)
(PB-300908/1; FHWA/RD-79/88; CES-4003) Avail: NTIS HC A08/MF A01 CSCL 13B

The development of a prototype in situ test device, designated the field permeability testing device for determination of the permeability of highway base and subbase courses is described and discussed. The feasibility of in situ permeability measurement techniques was investigted which led to the selection of the velocity method of in situ permeability determination for further development. A prototype field permeability test device was constructed and an extensive program of laboratory and field evaluations of this equipment was performed. It was concluded that the prototype field permeability test device developed satisfies project objectives and provides a convenient means for the determination of the in situ coefficient of permeability of highway bases and subbases with reasonable accuracy and reproducibility. GRA

EVALUATION OF THE EFFECTIVENESS OF FABRIC REINFORCEMENT IN EXTENDING THE IN-SERVICE LIFE OF BITUMINOUS CONCRETE OVERLAYS Final Report

W. G. Mullen and Robert J. Hader Jul. 1979 82 p Prepared in cooperation with North Carolina State Dept. of Transportation, Raleigh

(PB-301305/9; ERSD-110-71-5; FHWA/NC-79/001) Avail: NTIS HC A05/MF A01 CSCL 13B

Tests of fabric and non-fabric treated overlays of a jointed unreinforced portland cement concrete pavement on US 70 in Orange County, North Carolina are described. Four continuous fabric and four strip fabric treatments were used in addition to four non-fabric treatments, one of which was the regular two inch 1-2 overlay used for control. The fabrics were three woven or non-woven polymeric materials and one woven fiberglass. The four non-fabric treatments consisted of a surface treatment type mat course, a plant mixed mat coat, an opengraded mix course laid directly on the old pavement and covered with the 1-2 mix, and the 1-2 mix used for control. ASEISMIC DESIGN PROCEDURES FOR REINFORCED CONCRETE FRAMES. SEISMIC BEHAVIOR AND DESIGN OF BUILDINGS

John M. Biggs, Wai K. Lau, and Drew Persinko Jul. 1979 90 p refs

(Grant NSF ENV-77-14714)

(PB80-104128; NSF/RA-790205; Rept-1) Avail: NTIS HC A05/MF A01 CSCL 13M

Twelve reinforced concrete frames are designed for earthquake and gravity loads using three different procedures for determining the seismic design loads. The procedures are: (1) UBC static load approach; (2) modal analysis using inelastic response spectra; and (3) substitute structure method. The frames are of 4, 8 and 10 stories. The validity of each design procedure is evaluated by time-history analysis of each frame to determine maximum local ductility demands due to both real and artificial ground motion. None of the three methods is found to be completely satisfactory because the ductility demands are not the same as intended in the design and are not evenly distributed over the frame. GRA

ANALYTICAL METHOD FOR DETERMINING SEISMIC RESPONSE OF COOLING TOWERS ON FOOTING FOUNDATIONS Interim Report

O. M. El-Shafee and P. L. Gould Sep. 1979 228 p refs

(Grant NSF PFR-79-00012)

(PB-301398/3; RR-55; NSF/RA-790165; IR-1) Avail: NTIS HC A11/MF A01 CSCL 13M

A finite element model was developed to analyze shells of revolution under dynamic loading with soil-structure interaction effects. The model consists of high-precision rotational shell finite elements, representing the axisymmetric shell, supported on an equivalent boundary system, representing the soil medium. The substructure method is used to model the shell and soil components. In addition to the seismic analysis capability of the proposed model, it is also applicable to other dynamic loads such as wind. The dynamic behavior of a hyperboloidal cooling tower is studied using the proposed model. Dynamic properties are studied and stress analysis is carried out for a variety of soil conditions. GRA

PROBABILISTIC ANALYSIS OF TEMPERATURE LOADS FOR STRUCTURES, STRUCTURAL LOADS ANALYSIS AND SPECIFICATIONS PROJECT

Paul Millman, Robert Kilcup, and C. Allin Cornell Mar. 1979 211 p refs

(Grant NSF ENV-73-00345)

(PB-301415/6; R79-10; NSF/RA-790179) Avail: NTIS HC A10/MF A01 CSCL 13M

Three methods for the probabilistic analysis of temperature effects in building elements are applied to a simple one-dimensional temperature model which could represent a building wall element. The first method is a finite difference solution of the governing differential equation with an actual temperature record as input. In the second method, the temperature record is characterized in the frequency domain by a power spectral density function. The third method uses a simplified approach in which it is observed that the average strain and curvature in a wall are similar in effect to a time averaging filter applied to the temperature record. GRA

EXPERIMENTAL STUDY OF FRAME-WALL INTERACTION IN REINFORCED CONCRETE STRUCTURES SUBJECTED TO STRONG EARTHQUAKE MOTIONS

Daniel P. Abrams and Mete A. Sozen May 1979 400 p refs

(Grant NSF PFR-78-16318)

(PB-301091/5; Structural-Research-Ser-460; UILU-ENG-79-2002; NSF/RA-790132) Avail: NTIS HC A17/MF A01 CSCL 13M

The response of frame-wall structures to strong earthquake motions was studied. Each small-scale structure consisted of two three-bay frames and one wall resisting lateral loads in parallel. Measurements included accelerations, displacements, and forces resisted by the interior wall. The response of the test structures was examined in terms of apparent modal properties to evaluate the correctness of using a linear modal analysis with arbitrarily softened member stiffnesses to estimate response of the nonlinearly behaving structures. Internal force measurements were also examined to investigate frame-wall interaction in the nonlinear range of response and to check the reliability of the proposed design method for proportioning individual elements. GRA

INVESTIGATION OF THE NONLINEAR CHARACTERISTICS OF A THREE STORY STEEL FRAME USING SYSTEM

Izak Kaya and Hugh D. McNiven Dec. 1978 97 p refs

(Grant NSF ENV-76-04262)

(PB-301363/8; UBC/EERC-78/25; NSF/RA-780681) Avail: NTIS HC A05/MF A01 CSCL 13M

Two mathematical models were constructed of a three-story steel frame that are meant to predict its responses to seismic disturbances. The models constructed are meant to predict nonlinear response. This extension consists of accounting both for changes in the damping coefficients when the amplitudes of motion are large, and for yielding by including the hysteretic behavior of the ends of the members. The hysteretic relationship between the bending moments and rotations at the ends of the members are modeled. With the introduction of hysteretic material behavior, three parameters are added to the eight which are a carry-over from the linear model, so that the new nonlinear models contain eleven parameters. GRA

N80-16254# California Univ., Richmond. Earthquake Engineering Research Center.

SEISMIC BEHAVIOR OF REINFORCED CONCRETE INTERIOR BEAM-COLUMN SUBASSEMBLAGES

Suthipoul Viwathanatepa, Egor P. Popov, and Vitelmo Y. Bertero Jun. 1979 201 p refs

(Grants NSF AEN-73-07734; NSF ENV-76-04263)

(PB-301326/5; UCB/EERC-79/14; NSF/RA-790186) Avail: NTIS HC A10/MF A01 CSCL 13M

Details of experiments to test the seismic behavior of reinforced concrete subassemblages carried out on beam-column subassemblages are presented as well as an evaluation of the significance of the analytical and experimental results obtained. Two virgin concrete subassemblages and one repaired subassem-

blage were tested. A horizontal force was applied to one subassemblage to generate a large single hysteretic loop, the initial part of which provided information on monotonic loading. Once the loading sequence was completed, this specimen was repaired by epoxy injection processes and an incremental cyclic load was applied until failure occurred. The second specimen was tested to failure by applying a similar loading sequence. GRA

STATIC TILT TEST OF A TAIL CYLINDRICAL LIQUID STORAGE TANK
Ray W. Clough and Akira Niwa Feb. 1979 118 p refs Sponsored by Chevron Oil Field Res. Co.
(PB-301167/3; UCB/EERC-79/06) Avail: NTIS HC A06/MF A01 CSCL 13M
Results of a static tilt test investigation of a 7 3/4 x 15 ft cylindrical liquid storage tank are presented. The test is performed by mounting the tank on a rigid platform, filling it with water, and tilting the platform by lifting one edge with a laboratory crane. Principal test parameters include water depth, tilt angle top condition (open or with roof), and base fixity condition. Test measurements include tank deformations and membrane stresses. The observed behavior is also compared with results to typical design calculations. The unanchored tank tilts more and develops much greater axial stresses than are indicated by typical design procedures. GRA

PRODUCING SLUSH OXYGEN WITH AN AUGER AND MEASURING THE STORAGE CHARACTERISTICS OF SLUSH HYDROGEN
Roland Voth and Paul R. Ludtke Mar. 1979 42 p refs
(NASA Order CC-6253-QA)
(NASA-CR-158412; PB-298555/4; NBSIR-79-1607) Avail: NTIS HC A03/MF A01 CSCL 07D
An auger rotating inside a brass tube refrigerated with liquid helium was used to produce liquid-solid (slush) mixtures of oxygen. The auger produced small particles of solid oxygen so that the resulting mixture could be transferred and stored. The auger could produce slush continuously in an appropriate system, and it could produce slush at pressures higher than the triple point pressure of the oxygen. Three long term storage tests were conducted on an Apollo hydrogen vessel. Filling with slush instead of liquid hydrogen increased the storage time before venting by 1.08 to 1.17 times and increased the mass loaded by 1.11 to 1.13 times. GRA

ELECTRIC AND MAGNETIC FIELDS OF AN INTENSE PULSE OF RELATIVISTIC ELECTRONS PROPAGATING THROUGH AIR Ph.D. Thesis
Kenneth Allen Dreyer 1979 206 p
Avail: Univ. Microfilms Order No. 7923337
The theoretical models developed for the electromagnetic fields associated with an electron beam propagating in air are described. One and two dimensional models of the fields, and a model for the electron avalanche of the air are discussed. The ionization process over a pressure range of from five Torr to 760 Torr is described and the net current which saturates near 15 kiloamps at sealevel pressure, and saturates at lower values at lower air pressures is examined. Dissert. Abstr.

N80-16258 Stanford Univ., Calif.
SPECTRAL PEAK AMPLITUDE CODING FOR VOICE DATA COMPRESSION Ph.D. Thesis
George Heavener Smith 1979 101 p
Avail: Univ. Microfilms Order No. 8002017
A speech coding technique which exploits the quasiperiodic nature of voiced speech without relying on pitch estimation is explored. The technique relies on the fact that the bulk of the energy is a short term Fourier transform of voiced speech resides in about a dozen relatively narrowband spectral peaks. The technique was applied to speech whitened by an LPC inverse filter. Spectral peak coding was also applied to the original speech waveform without inverse filtering and experiments are described which explore the issues of the number of peaks required, the peak widths required, the amplitude and phase quantization, and efficient coding for marking the peak frequencies. An intelligibility experiment is described which demonstrates that the technique can robustly code speech at about 8 to 9 kbps. Dissert. Abstr.

TECHNIQUE TO DETERMINE LOCATION OF RADIO SOURCES FROM MEASUREMENTS TAKEN ON SPINNING SPACECRAFT
J. Fainberg Nov. 1979 57 p refs Submitted for publication
(NASA-TM-80598) Avail: NTIS HC A04/MF A01 CSCL 20N
The procedure developed to extract average source direction and average source size from spin-modulated radio astronomy data measured on the IMP-6 spacecraft is described. Because all measurements are used, rather than just finding maxima or minima in the data, the method is very sensitive, even in the presence of large amounts of noise. The technique is applicable to all experiments with directivity characteristics. It is suitable for onboard processing on satellites to reduce the data flow to Earth. The application to spin-modulated nonpolarized radio astronomy data is made and includes the effects of noise, background, and second source interference. The analysis was tested with computer simulated data and the results agree with analytic predictions. Applications of this method with IMP-6 radio data have led to: (1) determination of source positions of traveling solar radio bursts at large distances from the Sun; (2) mapping of magnetospheric radio emissions by radio triangulation; and (3) detection of low frequency radio emissions from Jupiter and Saturn. M.M.M.

ANTENNA FEED SYSTEM FOR RECEIVING CIRCULAR POLARIZATION AND TRANSMITTING LINEAR POLARIZATION Patent Application
Boris L. Seidel (JPL) and Dan A. Bathker, inventors (to NASA) (JPL) Filed 30 Oct. 1979 13 p
(Contract NAS7-100)
(NASA-Case-NPO-14362-1; US-Patent-Appl-SN-106118) Avail: NTIS HC A02/MF A01 CSCL 20N
An invention is described which provides for receiving a circularly polarized signal from an antenna feed connected to orthogonally spaced antenna elements. It also provides for transmitting a linearly polarized signal through the same feed

without switches, and without suffering a 3 dB polarization mismatch loss, using an arrangement of hybrid junctions. The arrangement is comprised of two dividing hybrid junctions, each connected to a different pair of antenna elements and a summing hybrid junction. In one version, a receiver is connected to the summing hybrid junction directly. A diplexer is used to connect a transmitter to only one pair of antenna elements. In another version, designated left and right circularly polarized (LCP and RCP) transmitters are connected to the summing hybrid junction by separate diplexers, and separate LCP and RCP sensitive receivers are connected to the diplexers in order to transmit linearly polarized signals using all four antenna elements while receiving circularly polarized signals as before. An orthomode junction and horn antenna may replace the two dividing hybrid junctions and antenna feed. NASA

COMPARISON OF RADAR DERIVED RAIN ATTENUATION WITH THE COMSTAR BEACON AT 28.56 GHz FOR SUMMER AND WINTER PERIODS
Julius Goldhirsh Jul. 1979 38 p refs
(Contract N00024-78-C-5384)
(APL/JHU/SIR-79U-016) Avail: NTIS HC A03/MF A01

Results are given pertaining to an experiment whose aims are to test and improve the accuracy of radar derived slant path rain attenuation methods. These estimated results are compared with measured rain fade levels of the COMSTAR beacon signal at 28.56 GHz at Wallops Island, Virginia. The data base corresponds to five rain days flanking the winter of 1978-79 during which 715 minutes of simultaneous radar and disdrometer data were obtained. Agreement between estimated and measured individual rain fade events was found to be generally good. Agreement between corresponding conditional cumulative fade distributions was excellent. The Marshall-Palmer distribution was injected into the radar program and gave similarly good results. The application of the Marshall-Palmer distribution for stratiform type rains as is generally the rain type for winter periods is consistent with the results obtained. M.M.M.

N80-16263*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
WEIGHTING IN DIGITAL SYNTHETIC APERTURE RADAR PROCESSING
Alan DiCenzo 15 Nov. 1979 25 p refs
(Contract NAS7-100)
(NASA-CR-162684; JPL-PUB-79-94) Avail: NTIS HC A02/MF A01 CSCL 17I

Weighting is employed in synthetic aperture radar (SAR) processing to reduce the sidelobe response at the expense of peak center response height and mainlobe resolution. The weighting effectiveness in digital processing depends not only on the choice of weighting function, but on the fineness of sampling and quantization, on the time bandwidth product, on the quadratic phase error, and on the azimuth antenna pattern. The results of simulations conducted to uncover the effect of these parameters on azimuth weighting effectiveness are presented. In particular, it is shown that multilook capabilities of future SAR systems may obviate the need for consideration of the antenna pattern, and that azimuth time-bandwidth products of over 200 are probably required before the digital results begin to approach the ideal results. A SURVEY OF AIRBORNE RADAR SYSTEMS FOR DEPLOYMENT ON A HIGH ALTITUDE POWERED PLATFORM (HAPP) Final Report
B. J. Choudhury and K. C. Leung Oct. 1979 39 p refs
(Contract NAS6-6569)
(NASA-CR-156860; CSC/TM-79/6294) Avail: NTIS HC A03/MF A01 CSCL 17I

A survey was conducted to find out the system characteristics of commercially available and unclassified military radars suitable for deployment on a stationary platform. A total of ten domestic and eight foreign manufacturers of the radar systems were identified. Questionnaires were sent to manufacturers requesting information concerning the system characteristics: frequency, power used, weight, volume, power radiated, antenna pattern, resolution, display capabilities, pulse repetition frequency, and sensitivity. A literature search was also made to gather the system characteristics information. Results of the survey are documented and comparisons are made among available radar systems. M.M.M.

ON THE EFFECT OF REDUNDANCY ON THE MULTIPLE ACCESS BROADCAST CHANNEL M.S. Thesis
Oliver Chukwudi Ibe Aug. 1979 78 p refs
(Contract N00014-75-C-1183; ARPA Order 3045)
(AD-A073579; LIDS-TH-924) Avail: NTIS HC A05/MF A01 CSCL 17/2

We consider strategies for transmitting packets over a multiple access broadcast channel. In the strategies considered, a message is formatted into K packets and N-K redundant packets are added to these K packets to form what we call a superpacket. We propose a simple coding scheme that sets these N packets of a superpacket into a special temporal pattern. With a superpacket constructed in this manner, it is possible to reconstruct packets which are lost through collision on the channel with the packets of other superpackets. We compare the throughput of our scheme with that of the slotted Aloha scheme. We use as our retransmission strategy the conflict resolving tree algorithm of Capetanakis. GRA

SOME FUNDAMENTAL CONSIDERATIONS OF THE EQUATION OF RADIATIVE TRANSFER
J. G. Kuriyan and E. C. G. Sudarshan Oct. 1978 24 p refs
(Contract EY-76-S-05-3992)
(ORO-3992-345) Avail: NTIS HC A02/MF A01

The vector transfer equation of the direct beam (Beer's law) is derived from first principles. It is shown that the analysis of this equation provides a satisfactory resolution of two problems underlying the radiative transfer of the vector electromagnetic field. The results also show that the Beer's law will have to be modified to make a matrix law to accomodate systems that are not spherically symmetric. R.C.T.

PROBABILITY OF INTERMODULATION INTERFERENCE IN AN EXPANDED CB SERVICE Final Report
Leslie A. Berry Jul. 1979 26 p refs
(Contract FCC-RA-0056-9)
(PB-300296/1; NTIA/TM-79/15; FCC/PRB/PD-79/01) Avail: NTIS HC A03/MF A01 CSCL 17B

In 1976, the Federal Communications Commission expanded the Citizens Radio Service from 23 to 40 channels. If the band had been expanded more, some channels would have been separated by at least 450 KHz. The intermediate frequency (IF) on many CB receivers is 455 KHz, so separations this large could result in intermodulation product interference. The probability of second order intermodulation interference in an expanded CB service is calculated. The results are presented in the form of decreases in the average operational range of CB stations in the presence of radio noise, co-channel interference, and intermodulation interferences. It is concluded that if 40 single-sideband only channels are added to the present Citizens Radio Service, second-order intermodulation interference will decrease the median operation range by less than 10 percent, while allowing a large increase in the numbers of users. A COMPATIBILITY ANALYSIS OF SPREAD-SPECTRUM AND FM LAND MOBILE RADIO SYSTEMS
John R. Juroshek Aug. 1979 77 p refs
(PB-300651/7; NTIA/REPT-79/23) Avail: NTIS HC A05/MF A01 CSCL 17B

The possibility of overlaying a spread-spectrum system into frequency bands containing conventional FM land-mobile systems is examined. Overlaying is interpreted as meaning the unrestricted operation of spread-spectrum and FM mobiles throughout the same service area and on the same frequency. Conventional

spread-spectrum and FM systems are assumed where a single base serves a large urban area. A theoretical compatibility study is described that concludes that significant interference would result to existing FM systems. This conclusion assumes spread-spectrum transmitter powers comparable to existing FM systems. Landmobile operating frequencies of 150 and 900 MHz are considered. Also examined is the reverse problem of interference from FM to spread spectrum. Curves are prepared showing separation requirement for various channel multipath conditions. A computer simulation program is also described that simulates the operation of a spread-spectrum system in a multiple FM interferer environment. The conclusions are that an overlayed spread-spectrum system also would receive significant interference. A frequency hopping, spread-spectrum system is described that is programmed to miss those FM channels in use at a given locality. The advantages obtained with this technique are briefly discussed. INVESTIGATION OF DIGITAL MICROWAVE COMMUNICATIONS IN A STRONG METEOROLOGICAL DUCTING ENVIRONMENT
R. W. Hubbard Aug. 1979 96 p refs Sponsored in part by Pacific Missile Test Center, Point Mugu, Calif.
(Contract MIPR-N-63126-78MP-31106)
(PB-301212/7; NTIA/REPT-79/24) Avail: NTIS
HC A05/MF A01 CSCL 17B

An experiment conducted over a LOS microwave link off the coast of southern California is described. The objective was to determine the effect of known anomalous propagating conditions, caused by persistent temperature inversions in the atmosphere on a wideband digital communications system. A channel probe was used to measure the effective impulse response of the transmission channel, and bit-error-rate measurements were made on the same probe test signal. In addition, a dual receiver was used to investigate the application of angle diversity on the reception of signals in this propagation environment. The results of the experiment indicate that the test link should, if properly configured, support digital transmission at a mission rate on the order of 50 Mb/s. Recommendations for implementing a digital system for the specific link are given. GRA

HC A12/MF A01 CSCL 17B

The evolution of television channel selectors on television receivers and their relevance to vidwing habits are examined. Channel selectors currently in use and their costs and technological capabilities are discussed, as well as current Commission regulations concerning acceptable types of channel selectors. The UHF picture quality handicap is analyzed. Signal behavior from the transmission system to the receiving system is examined. Poor picture quality occurring as a result of the interrelationships between television transmitters, receivers, and antenna systems is also discussed as well as the potential for improvements as a result of changes to one/or a combination of those components. HC A08/MF A01 CSCL 17B

The growth is charted of U.S. Domestic Satellite Communications during the first years of earth terminal proliferation with emphasis on the compatibility of satellite and cable as a total communication system. The geostationary relay is shown to provide anywhere to everywhere communication for video distribution and for non-video services. The effects of favorable regulation and of continued improvement in terminal equipment are shown to have stimulated satellite usage. Recent growth is illustrated by an earth station index listed by state. Technical characteristics of satellite communications are reviewed, together with procedures for establishing earth terminal sites. The complexity of traffic scheduling is acknowledged as a stimulus for improvement of techniques and development of additional capacity. Opportunities for common carrier, private and shared use are examined. Current or proposed means for accomodating non-video services are described. Elements of digital transmission are examined. The need for interconnection with local distribution systems is described, with particular attention to broadband terrestrial systems. Cable television, private microwave systems and improved common carrier facilities are examined as possible means of supplying this need. GRA

THEORETICAL AND EXPERIMENTAL SQUARE WAVE VOLTAMMETRY Ph.D. Thesis
John Joseph Odea 1979 129 p
Avail: Univ. Microfilms Order No. 7928537

The theory of square wave voltammetry was extended to include electron transfer kinetics, and first order preceding, following and catalytic reactions. The effects of these complications upon experimentally measurable peak positions, heights and widths were predicted by the numerical solution of the integral equations describing the systems. A fast scan square wave technique useful at frequencies up to 1250 Hz and scan rates of 6.25 volts per second was developed to test the theoretical predictions experimentally. A laboratory minicomputer interfaced to a static mercury drop electrode was used for data acquisition and real time control of the experiment. The quasireversible reduction of zinc, the dissociation of cadmium EDTA preceding electron transfer, the rearrangement of hydrazobenzene following electron transfer, and the catalytic reduction of titanium were chosen as model systems. Dissert. Abstr.

PINCHED RELATIVISTIC ELECTRON BEAMS AND COLLECTIVE ACCELERATION OF IONS Ph.D. Thesis
Victor Serlin 1979 129 p
Avail: Univ. Microfilms Order No. 8001271

The collective acceleration of ions by a pinched relativistic electron beam is discussed. Two areas of relativistic electron beam research were investigated, electron beam pinch in the diode and the ion acceleration in an evacuated drift chamber. A 550 keV electron beam with peak current of 55 kA and of 50 nanoseconds duration, was produced in a high voltage diode.

designed specifically for a tight pinching of the electron beam. The characteristics of the electron beam pinch were investigated by means of X-ray pin hole photography, scintillator photography, current and energy measurements in the focal spot of the anode, and damage patterns on witness anode plates. The ion acceleration was studied by means of time analyzed current measurements, ion time of flight analysis, and calorimetry. Results are reported. Dissert. Abstr.

DIELECTRIC AND PYROELECTRIC PROPERTIES OF FERROELECTRICS Ph.D. Thesis
Yuan-Huai Tsuo 1978 181 p
Avail: Univ. Microfilms Order No. 8001275

The dielectric and pyroelectric properties of ferroelectrics were studied by measuring the temperature and electric field dependence of their dielectric constants and pyroelectric coefficients. Three types of ferroelectrics, classified according to the nature of the order parameters describing their phase transitions, are included: (1) proper ferroelectrics in which the order parameter is the electrical polarization; (2) improper ferroelectrics, in which the order parameter is not the polarization, and the spontaneous polarization arises from a nonlinear coupling of the polarization to the order parameter; and (3) pseudoproper ferroelectrics, in which the order parameter is also not the polarization, but the coupling with the polarization is linear. It is shown that the small dielectric anomalies of improper and pseudoproper ferroelectrics yield an important advantage in infrared detection and pyroelectric energy conversion. But the large Curie constants of proper ferroelectrics are advantageous in thermodielectric energy conversion. Dissert. Abstr.

ELECTROMAGNETIC SCATTERING BY TWO BODIES OF REVOLUTION Ph.D. Thesis
John Frank Hunka 1979 115 p
Avail: Univ. Microfilms Order No. 8000387

A systematic procedure for solving the two body of revolution scattering problem by interfacing with a unimoment program is presented. Spherical vector wave function expansions and addition theorems were investigated. A scatter-independent, modal incident field formulation was developed as a means of interfacing the multiple scattering and unimoment programs. Also, an experimental scattering measurement system was used for the verification of the multiple scattering computations. The verification of the multiple scattering program both numerically and experimentally is discussed in depth. Selected case studies of two body configurations are presented to demonstrate the utility of the program and to lay a foundation for future study and analysis. Dissert. Abstr.

Electromagnetic seawater thrusters may be classified in one of three general categories: internal duct dc, external field dc, and peristalic ac. Internal duct dc thruster offers the advantages of low magnetic field leakage, simple construction, and potentially high reliability. The most efficient internal duct configuration consists of a converging inlet nozzle and a straight discharge duct. Ideal efficiency calculations based on the one-dimensional Bernoulli equation show that thrusters should be designed with large cross-sectional areas and operate at low discharge velocities. In practice, this may be accomplished by using multiple thruster ducts. Conductivity enhancement, high magnetic fields, and long electrodes also improve efficiency. While the magnetic field-volume requirements for a thruster capable of propelling full-size (2000 ton displacement) submarines appear beyond the present technology, it may be feasible to use superconducting magnets to build high efficiency, internal duct thrusters capable of maneuvering small (approx. 10 ton displacement) submersibles. AN ac/dc POWER CONVERTER FOR BATTERIES AND FUEL CELLS Annual Report
Ramon W. Rosati, ed. Aug. 1978 98 p refs Sponsored by Elec. Power Res. Inst.
(EPRI-EM-662) Avail: NTIS HC A05/MF A01

The overall objective of the EPRI program is the design of an advanced power converter for use in both battery energy storage and fuel cell generation systems. This will be accomplished by expansion of the existing FCG-1 fuel cell power conditioning inverter into a high-efficiency inverter-rectifier system employing improved commutation circuits and advanced semiconductor devices capable of operating over wider dc voltage ranges. A separate but concurrent program for the U. S. Department of Energy (DOE) is examining augmentation of the present FCG-1 inverter for operation as an inverter-rectifier with battery systems; feasibility and operating characteristics were demonstrated. Activities ahp accomplishments in the EPRI program include revision of the preliminary specification for ac/dc conversion equipment, survey of seven semiconductor manufacturers to project characteristics of thyristors, screening of fifteen commutation concepts and selection of the two most promising options for experimental evaluation, and modifications of existing experimental power pole hardware to evaluate the selected advanced commutation circuits. DOE

IMPROVING THE VOLTAGE HOLDOFF PERFORMANCE OF ALUMINA INSULATORS IN VACUUM THROUGH QUASI-METALLIZING
H. Craig Miller 6 Aug. 1979 24 p refs
(Contract EY-76-C-04-0656)
(GEPP-TIS-441) Avail: NTIS HC A02/MF A01

Treatment of the surface of an alumina insulator with coatings incorporating varying amounts of Cr, Mn, and Ti was examined for increasing the vacuum voltage holdoff capability of the insulator. During processing (quasimetallizing) the coating penetrates into the alumina, so it is insensitive to mechanical damage. The quasimetallizing treatment and the effectiveness of each metal and the metal mixes toward improving the voltage holdoff capability of alumina are reported. Quasimetallizing with appropriate formulations were shown to change the surface characteristics of alumina in two ways: it decreases the surface resistivity of the alumina, and it decreases the secondary electron emission yield of the alumina. TRANSITIONAL FLOW IN AN ANNULUS Ph.D. Thesis
James Max Peterson 1979 165 p
Avail: Univ. Microfilms Order No. 8000087

Fully developed laminar, transitional and turbulent flow of a Newtonian fluid in an annulus of diameter ratio 0.0415 was investigated. Measurements were made of the axial pressure gradient, turbulence intensity, velocities, location of the point of maximum velocity. A range of Reynolds numbers (based on the diameter difference and mass flow rate) from 750 to 130,000 was covered. It was shown that the mean velocity profiles were not rectilinear laminar, were fully developed axially, and varied with the angular position around the annulus indicating a complex laminar flow. Composite pipe measurements show that when a fully developed Poiseuille pipe flow is subjected to several types of disturbance, the transition behavior of the stream depends upon whether the stream impinging upon the disturbance source is itself laminar or turbulent. Dissert. Abstr.

N80-16290 Iowa State Univ. of Science and Technology, Ames.
STABILITY ANALYSIS OF INTERFACIAL CIRCULATION ON A STATIC LIQUID DROP WITH FORCED INTERNAL CIRCULATION Ph.D. Thesis
Soo Bong Joo 1979 181 p
Avail: Univ. Microfilms Order No. 8000142

A hemispherical constant volume drop with forced internal circulation was considered as a model approximating a real drop at a similar stage of formation. It was proposed that the ordered flow patterns of interfacial circulation observed experimentally on the surface of such a drop are a manifestation of hydrodynamic instability, which was affected by internal flow conditions within the drop and by the properties of the interface. A simplified mathematical model was analyzed in order to detail the mechanism for the onset of interfacial circulation from a non-circulatory basic state. Dissert. Abstr.

N80-16291 Stanford Univ., Calif.
NATURAL CONVECTION IN A VERTICAL CHANNEL WITH HEAT AND MASS TRANSFER AND FLOW REVERSAL Ph.D. Thesis
Tsong-Sheng Lee 1979 175 p
Avail: Univ. Microfilms Order No. 8001957

The time-dependent, variable-property governing equations together with the assumed boundary conditions at the channel entrance and exit are solved by using an implicit finite-difference method. Steady-state solutions are obtained for Grashof numbers, GT, up to 700, and channel height-to-width ratios, 10 and 16, over a range of injected mass fluxes of CO_2. Particular attention is given to the effects of the reverse flow on the heat and mass transfer, and graphical results are presented. Mach-Zehnder interferometer and a traversing thermocouple probe were used simultaneously to determine the profiles of temperature and mass concentration in the channel. Results of the measurements are presented and assessed. Experimental results were also obtained for the stability characteristics of the reverse flow, and are presented graphically. Dissert. Abstr.

AN EXPERIMENTAL STUDY OF MULTIPLE JET MIXING Ph.D. Thesis
Anjaneyulu Krothapalli 1979 166 p
Avail: Univ. Microfilms Order No. 8001955

Results of hot-wire measurements in an incompressible jet issuing from an array of rectangular lobes, equally spaced with their small dimensions in a line, both as a free jet, and as a confined jet, are presented. The quantities measured include mean velocity and the Reynolds stress in the two central planes of the jet at various stations downstream of the nozzle exit. In the case of a single rectangular free jet, the flow field of the jet is found to be characterized by the presence of three distinct regions in the axial mean velocity decay. In the case of a multiple free jet, the flow field for downstream distance X greater than 60D (D = width of a lobe) resembles that of a jet exiting from a two dimensional nozzle with its short dimension being the long dimension of the lobe. In case of a confined multiple jet the flow field is observed to be nearly homogeneous and isotropic for X greater than 60D. Dissert. Abstr.

N80-16293 Utah Univ., Salt Lake City.
THE EFFECT OF SUPERHEATING ON THE PERFORMANCE OF FLOATING DROPLET DIRECT CONTACT HEAT EXCHANGERS Ph.D. Thesis
Calvin Albert Kodres, Jr. 1979 174 p
Avail: Univ. Microfilms Order No. 8000972

A mathematical model of a single evaporating, superheated droplet is formulated and studied numerically to determine instantaneous and average heat transfer rates to the droplet at various stages of evaporation. An explicit procedure for analyzing the entire heat exchanger is then developed based upon the application of a dimensional analysis derivation of a relationship for the heat flux from the single evaporating droplet. The results of the numerical model are used to define the parameters and determine the required constants. Two operating geothermal heat exchangers are designed using this procedure. The two sites both have a moderate temperature brine and both systems utilize pentane as the working fluid. The heat exchanger vessel pressures are varied, providing a range of superheats from 19 to 52 C. The average difference between the calculated and measured total heat flux is about 16%. Dissert. EFFECT OF STREAMWISE VORTICES ON TOLLMIEN-SCHLICHTING WAVES
Ali H. Nayfeh Mar. 1979 20 p refs
(Grant NsG-1255; Contract N00014-75-C-0381)
(NASA-CR-162654; VPI-E-79.12) Avail: NTIS HC A02/MF A01 CSCL 20D

The method of multiple scales is used to determine a first order uniform expansion for the effect of counter rotating steady streamwise vortices in growing boundary layers on Tollmien-Schlichting waves. The results show that such vortices have a strong tendency to amplify three dimensional Tollmien-Schlichting waves having a spanwise wavelength that is twice the wavelength of the vortices. An analytical expression is derived for the growth rates of these waves. These growth rates increase linearly with increasing amplitudes of the vortices. Author

EVALUATION OF LAGRANGIAN, EULERIAN, ARBITARY LAGRANGIAN-EULERIAN METHODS FOR FLUID-STRUCTURE INTERACTION PROBLEMS IN HCDA ANALYSIS
Y. W. Chang, H. Y. Chu, and C. Y. Wang 1979 16 p refs
Presented at 5th SMIRT Conf., Berlin, 13-17 Aug. 1979
(Contract W-31-109-eng-38)
(CONF-790802-55) Avail: NTIS HC A02/MF A01

The analysis of fluid-structure interaction involved the calculation of both fluid transient and structure dynamics. In the structural analysis, Lagrangian meshes were used exclusively, whereas for the fluid transient, Lagrangian, Eulerian, and arbitrary Lagrangian-Eulerian meshes were used. An evaluation on these three types of meshes is presented with emphasis on the applicability of the method in analyzing fluid-structure interaction problems in hypothetical core disruptive accident analysis. NONPARALLEL STABILITY OF THREE-DIMENSIONAL COMPRESSIBLE BOUNDARY LAYERS. PART 1: STABILITY ANALYSIS Final Report
Nabil M. El-Hady Feb. 1980 38 p refs
(Grant NsG-1645)
(NASA-CR-3245) Avail: NTIS HC A03/MF A01 CSCL 20D

A compressible linear stability theory is presented for nonparallel three-dimensional boundary-layer flows, taking into account the normal velocity component as well as the streamwise and spanwise variations of the basic flow. The method of multiple scales is used to account for the nonparallelism of the basic

flow, and equations are derived for the spatial evolution of the disturbance amplitude and wavenumber. The numerical procedure for obtaining the solution of the nonparallel problem is outlined. Author

ANALYTICAL AND DESIGN TECHNIQUES FOR DRAG REDUCTION STUDIES ON WAVY SURFACES Final Report
R. Balasubramanian Jan. 1980 22 p refs
(Contract NAS1-15278)
(NASA-CR-3225) Avail: NTIS HC A02/MF A01 CSCL 20D

Numerical models for two dimensional turbulent boundary layers over wavy surfaces were investigated. Computations for wavy wall boundary layers indicate possibilities of overall drag reduction in a parameter range of the geometry of the wall. The correction technique using integral methods for analyzing arbitrary surfaces was found to be unsuitable for some cases of interest in drag reduction; a Navier-Stokes solver for wavy walls was built to test these problems. Test results of the Navier-Stokes solver indicate that the solution techniques are accurate enough to handle complex geometries and steep variations in fluid properties. Author

EVOLUTION OF WEAK DISTURBANCES IN INERT BINARY MIXTURES
M. L. Rasmussen Aug. 1977 32 p refs Sponsored in part by NASA
(NASA-TM-80925; SU-JIAA-TR-6) Avail: NTIS HC A03/MF A01 CSCL 20D

The evolution of weak disturbances in inert binary mixtures is determined for the one-dimensional piston problem. The interaction of the dissipative and nonlinear mechanisms is described by Burgers' equation. The binary mixture diffusion mechanisms enter as an additive term in an effective diffusivity. Results for the impulsive motion of a piston moving into an ambient medium and the sinusoidally oscillating piston are used to illustrate the results and elucidate the incorrect behavior pertaining to the associated linear theory. HOMOGENEOUS VORTEX MODEL FOR LIQUID SLOSH IN SPINNING SPHERICAL TANKS
Michael El-Raheb and Paul Wagner 15 Nov. 1979 46 p refs
(Contract NAS7-100)
(NASA-CR-162725; JPL-Pub-79-99) Avail: NTIS HC A03/MF A01 CSCL 20D

The problem of forced fluid sloshing in a partially filled spinning spherical tank is solved numerically using the finite element method. The governing equations include Coriolis acceleration, empirical fluid damping and spatially homogeneous vorticity first introduced by Pfeiffer. An exponential instability similar to flutter is detected in the present simulation for fill ratios below 50 percent. This instability appears in the model as a result of the homogeneous vortex assumption since the free slosh equations are neutrally stable in the Liapunov sense. Author

TURBULENCE MEASUREMENTS IN THE BOUNDARY LAYER OF A LOW-SPEED WIND TUNNEL USING LASER VELOCIMETRY
Edward T. Schairer Feb. 1980 25 p refs
(NASA-TM-81165; A-8058) Avail: NTIS HC A02/MF A01 CSCL 20D

Laser velocimeter measurements in an incompressible, turbulent boundary layer along the wall of a low-speed wind tunnel are presented. The laser data are compared with existing hot-wire anemometer measurements of a flat plate, incompressible, turbulent, boundary layer with zero pressure gradient. An argument is presented to explain why previous laser velocimeter measurements in zero pressure gradient, turbulent boundary layers have shown an unexpected decrease in turbulent shear stresses near the wall. AN EXPERIMENTAL INVESTIGATION OF THE EFFECT OF DRAG REDUCING POLYMER ADDITIVES ON SURFACE PRESSURE FLUCTATIONS ON BODIES OF REVOLUTION WITH ROUGH SURFACES MOVING THROUGH WATER Final Report, 1 May 1977 - 30 Apr. 1978
Edward Silberman May 1978 40 p refs
(Contract N00014-77-C-0356; SR-230101)
(AD-A073836; Rept-172) Avail: NTIS HC A03/MF A01 CSCL 20/4

A sound detector in the surface of a moving body receives not only sound signals radiated from a distant source but also detects pressure fluctuations originating in the turbulent boundary layer of the fluid surrounding the body. The purpose of the present work was to assess the magnitude of the surface pressure fluctuations on a body moving in water and in water with polymer additive under nearly zero pressure gradient conditions. Measurements were made using a single transducer in the surface of an axi-symmetric body. Both smooth and grit-roughened surfaces were used. Mean square pressure fluctuation amplitudes were measured as a function of frequency, non-dimensionalized, plotted, and compared with some results obtained by others in both water and air. It was concluded that the addition of roughness to a smooth surface increases the amplitude at the peak of the spectrum and at all lower frequencies. Polymer additive in the water has just the opposite effect on a rough-surfaced body, decreasing the amplitude at the peak and at all lower frequencies, the reduction increasing monotonically with drag reduction. There was little or no effect at high frequencies attributable to either roughness or polymer additive, but it must be noted that the transducer used was too large to obtain a true measure of amplitude at the highest frequencies. The peak of the spectrum in water appears to have a somewhat higher amplitude than it does in air. GRA

QUASI-EULERIAN FORMULATION FOR FLUID-STRUCTURE INTERACTION
J. M. Kennedy, T. Belytschko, and D. F. Schoeberle 1979 20 p refs Presented at the Intern. Conf. on Structural Mechanics in Reactor Technology, Berlin, 13 Aug. 1979
(Contract W-31-109-eng-38)
(CONF-790802-66) Avail: NTIS HC A02/MF A01

A quasi-Eulerian finite element formulation used for the treatment of the fluid in fluid-structure interaction problems is described. The present formulation is applicable both to plane two dimensional and axisymmetric three dimensional problems. The application of the method is illustrated in two problems: a two dimensional model of a cross section of a subassembly configuration, where the quasi-Eulerian formulation is used to model the fluid adjacent to the structures and in the channel between the subassemblies; and pressure transients in a straight pipe, where the axisymmetric formulation is used to model the fluid in the pipe. TURBULENT DUSTY GAS MOTIONS WITH WEAK STATISTICAL COUPLING
Alfred C. Buckingham 17 May 1979 22 p refs Presented at the AIAA Fluid and Plasma Dyn. Conf., Williamsburg, Va., 24 Jul. 1979
(Contract W-7405-eng-48)
(UCRL-82131; CONF-790704-1) Avail: NTIS HC A02/MF A01

Computer simulations were used to describe the random motions and resulting dispersal of gas borne particulates in turbulent internal ballistics flow. Force, energy and motion coupling between particles and gas was assumed weak, with negligible back influence from particles to gas flow structure. Individual particle to gas relative velocities were obtained at incremental time steps by randomization subject to the constraint that their ensemble averaged motions were consistent with the locally computed turbulent intensity. Influence of the particles on turbulent transport and wall erosion is discussed. DOE

APPLICATION OF THE FINITE ELEMENT METHOD TO THE NONLINEAR INVERSE HEAT CONDUCTION PROBLEM USING BECK'S SECOND METHOD
B. R. Bass 1978 44 p refs Presented to the ASME Meeting, San Francisco, Calif., 10 Dec. 1978
(Contract W-7405-eng-26)
(K/CSD/INF-78/20; CONF-781202-16) Avail: NTIS HC A03/MF A01

The application is presented of a solution technique for the inverse problem that utilizes a finite element heat conduction model and Beck's nonlinear estimation procedure. The technique is applicable to the one-dimensional nonlinear model with temperature-dependent thermophysical properties. The formulation is applied first to a numerical example with a known solution. The example treated is that of a periodic heat flux imposed on the surface of a rod. The computed surface heat flux is compared with the imposed heat flux to evaluate the performance of the technique in solving the inverse problem. Finally, the technique is applied to an experimentally determined temperature transient taken from an interior point of an electrically-heated composite rod. The results are compared with those obtained by applying a finite difference inverse technique to the same data. DOE

NUMERICAL SOLUTION OF THREE-DIMENSIONAL NATURAL CONVECTION BY THE STRONGLY IMPLICIT PROCEDURE
D. W. Pepper and S. D. Harris 1978 13 p refs Presented at the ASME Meeting, San Francisco, 10 Dec. 1978
(Contract EY-76-C-09-0001)
(DP-MS-78-14; CONF-781202-3) Avail: NTIS HC A02/MF A01

A numerical model was developed to solve three-dimensional laminar flow in enclosures. The model is based on a three-dimensional strongly implicit procedure. In simple cases of natural convection due to differential side heating, numerical results at low and moderate Rayleigh numbers agree with results appearing in the literature. Although the model requires a moderate amount of computer storage, computation times are relatively fast. The simple case of heating a cubical room by a uniform floor or ceiling heat system with a vertical wall exposed to a uniformly cooled surface is also investigated. DOE

PREDICTION OF LAMINAR AND TURBULENT FLOW HEAT TRANSFER IN ANNULAR PASSAGES
M. R. Malik and R. H. Pletcher Mar. 1979 285 p refs
(Grant NSF ENG-74-22193)
(PB-299867/2; ISU-ERI-AMES-79099) Avail: NTIS HC A13/MF A01 CSCL 20D

A finite difference numerical procedure for treating variable property laminar and turbulent convective heat transfer in straight annular passages is presented. The calculation scheme is evaluated for both laminar and turbulent flow including laminar upward forced flow with buoyancy. Models using an ordinary differential equation for the transport of mixing length scale in the outer part of the flow and employing a transport equation for turbulence kinetic energy are considered. Predictions are compared to experimental data. The experimentally observed nonmonotonic development of centerline velocity and other flow parameters in a plane duct are well predicted by the model using the transport equation for length scale. DIGITAL RECORDING USING HOLOGRAM ARRAYS: SOME INITIAL EXPERIMENTS IN 100 M bit/s RECORDING

K. Hacking and J. L. Riley Nov. 1979 20 p refs
(BBC-RD-1979/23) Avail: BBC, Kingswood Warren, Tadworth, Surrey, England

The construction of an experimental holographic recorder has advanced sufficiently to carry out some initial experiments and to obtain some sample recordings of hologram tracks written on continuously moving photographic film. The hologram exposures and data transfer rates were commensurate with those values required for digital television recording. Careful analysis of the reconstructed hologram images from the test recordings has revealed some problems associated with the film and its processing for this application. The results have also directed attention to several critical areas of the proposed system and underlined the deficiencies still remaining in the principal transducers such as the page-composer and the digital light-deflector. CW LASER ANNEALING OF ION IMPLANTED SINGLE CRYSTAL SILICON Ph.D. Thesis
Arnon Gat 1979 130 p
Avail: Univ. Microfilms Order No. 8001921

Experiments were performed on ion implanted arsenic and boron into single crystal silicon. Even though the two ions are different the same basic, unique properties to the cw laser anneal are found. These are: (1) high level of impurity activation as long as the concentration is below solid solubility, (2) crystalline perfection down to 10A resolution, and (3) lack of dopants redistribution from their as-implanted profile. It was shown that when the implanted layer is too deep, as in the case of high energy arsenic or silicon implants, the recrystallization is not

complete and the resultant structure is polysilicon. The thermal model presented suggests that the cw laser annealing process is performed under thermal equilibrium. Dissert. Abstr.

NONORTHOGONAL MEASUREMENT AXES IN LASER DOPPLER VELOCIMETRY Final Report, Oct. 1977 - Sep. 1978
F. L. Crosswy. Arnold AFS AEDC. Aug. 1979. 28 p. refs.
(AD-A073700; AEDC-TR-79-35) Avail: NTIS HC A03/MF A01 CSCL 20/5

The measurement axes of virtually all multiaxis laser Doppler velocimeter (LDV) systems are nonorthogonal to some degree and are, in general, rotated with respect to orthogonal, Cartesian reference axes. Systematic errors are introduced into the LDV data if axis nonorthogonality and spatial orientation parameters are not properly taken into account by the data reduction equations. This report develops the general 3-space expressions for velocity vector magnitude and spatial orientation in terms of rotated, oblique LDV measurement axis parameters and the velocity vector projections measured by each of these axes. STEP-BY-STEP APPROACH TO CONVECTIVE COOLING OF LASER DISC AMPLIFIERS
Robert F. Bourque. Apr. 1979. 37 p. refs.
(Contract W-7405-eng-48; GA Proj. 3072)
(UCRL-15047) Avail: NTIS HC A03/MF A01

A step by step approach is presented to the problem of gas cooling of laser glass amplifiers. The basic equations are given for glass conduction, thermal stress, gas convection, and heat exchanger and blower design. An example calculation is then carried out for helium gas at one atmosphere with the gas flow in the direction orthogonal to the optical path. It is found that pumping powers and temperatures are acceptable for this case. Results are also presented for helium in the slant direction and for nitrogen in both directions. The effects on pumping power of gas temperature rise, gas pressure, flashtube rep rate, and flow channel width are also included. It is found that, based on temperature rise and pumping power, nitrogen is as viable a coolant as helium. DOE

ANTARES LASER POWER AMPLIFIER
R. D. Stine, G. F. Ross, and C. J. Silvernail. 1979. 8 p. refs. Presented at the Pulsed Power Conf., Lubbock, Tex., 12-14 Jun. 1979
(Contract W-7405-eng-36)
(LA-UR-79-1525; CONF-790622-15) Avail: NTIS HC A02/MF A01

The design of the Antares laser power amplifier is discussed. The power amplifier is the last stage of amplification in the 100 kJ Antares laser. A single, cylindrical, grid control, cold cathode electron gun, surrounded by 12 large aperture CO2 electron beam sustained laser discharge sectors is described. A large scale interaction between optical, mechanical, and electrical disciplines required to meet the design objectives is discussed. Significant component advances required by the power amplifier design are reported. DOE

EVALUATION OF THE EFFECT OF PREPULSES ON HF LASER-TARGET INTERACTIONS
M. Keith Matzen. Jun. 1979. 25 p. refs.
(Contract EY-76-C-04-0789)
(SAND-79-0353) Avail: NTIS HC A02/MF A01

The effect of multinanosecond, low-power-density prepulses on the interaction of multinanosecond, 10 to the 14th power

W/sq cm. HF lasers pulses with slab targets were assessed. The emphasis is on analyzing absorption and X-ray conversion efficiency. A survey of previous experiments gives no evidence that these prepulses will affect the total absorption. However, prepulses have been observed to cause qualitative changes in both the X-ray spectrum and conversion efficiency. Numerical simulations indicate that the laser target interaction is effectively insensitive to low-power-density prepulses. These studies imply that basic laser target experiments with multiplexed, HF laser pulses will provide an important characterization of the interaction of long pulse, multiline, approximately 3 microns radiation with targets. Future wavelength comparison experiments will require prepulse suppression or target isolation. DOE

ANALYSIS OF THE Z DEPENDENCE OF LASER GENERATED SUPRATHERMAL ELECTRON TEMPERATURE
M. D. Rosen and K. G. Estabrook. 17 Apr. 1979. 20 p. refs. Presented at the 9th Ann. Conf. on Anomalous Absorption of Electromagnetic Waves, Rochester, N.Y., 15-18 May 1979. Submitted for publication.
(Contract W-7405-eng-48)
(UCRL-82280; CONF-790564-1) Avail: NTIS HC A02/MF A01

The systematic rise of temperature with Z is theoretically analyzed. It is believed that material albedoes (electron reflectivity) which increase with Z can account for this behavior, since electrons can make multiple passes through the region of resonant electric fields and are thus reheated. A quantitative treatment of this effect yields reasonable agreement with experiment. The effects of magnetic fields and filamentation are also examined. DOE

MASS SPECTROMETER DETERMINATION OF ARGON CONTENTS IN LASER FUSION TARGET PELLETS
C. M. Ward and L. E. Bergquist. 16 Apr. 1979. 14 p. refs. Presented at the 1st Topical Meeting on Fusion Reactor Mater., Miami Beach, Fla., 29-31 Jan. 1979. Prepared in cooperation with Martin Marietta Corp., Denver, Colo.
(Contract W-7405-eng-48)
(UCRL-81416-Rev-1; CONF-790125-78) Avail: NTIS HC A02/MF A01

A system for measuring argon contents in individual laser fusion targets using a getter pumped closed volume quadrupole mass spectrometer is developed. Accuracy of 10 percent can be obtained, limited by the calibration standard and electron multiplier drift. Measurements are simple, unambiguous and can be performed at up to one per hour with a sensitivity equivalent to 1,000 Pa (.01 atm) argon in a 140 micrometers internal diameter sphere. DOE

ANTARES POWER AMPLIFIEH OPTICAL SYSTEM
C. J. Silvernail and K. C. Jones. 1979. 8 p. refs. Presented at Conf. on Optics, Los Alamos, N. Mex., 23 May 1979.
(Contract W-7405-eng-36)
(LA-UR-79-2270; CONF-790529-11) Avail: NTIS HC A02/MF A01

The optical systems of the six Antares laser power amplifiers are described. These assemblies are preceded by the front end optits and followed by the target system. Each power amplifier receives an annular input beam and divides it into 12 beams which are then directed to double pass them through 12 gain regions surrounding a central electron gun. Provisions are made for spatially filtering each beam and for the possibility of adding saturable absorbers. Two keys to the successful completion of the power amplifier are: the avoidance of unwanted lasing modes and hot spots in the wavefronts, and the maintenance of alignment throughout the entire laser system, including the internal alignment of the Power Amplifier. DOE

ACTIVE OPTIMAL CONTROL FOR SUPPRESSION OF WHIRL OF A FLEXIBLE CENTRIFUGE Ph.D. Thesis
Marvin Taylor. 1979. 187 p.
Avail: Univ. Microfilms Order No. 8002501

A nonlinear dynamic model of a flexibly supported centrifuge rotor is formulated and studied parametrically for whirl, equilibrium and stability. Experimental data from a test rotor are compared to analytic results for a passive suspension system. The system equations are linearized for application of active linear regulator control and the use of Kalman sequential estimation to suppress whirl. The primary analysis considers a balanced rotor containing a loose small ball. Three additional cases are also studied: (1) unbalance in the rotor containing the small ball; (2) inclusion of the rotor shaft modes due to distributed mass and stiffness of the shaft; and (3) test rotor containing liquid rather than a ball. Computer simulations are performed demonstrating practical, effective feedback control for all of the above cases. Dissert. Abstr.

THERMAL ELASTOHYDRODYNAMIC LUBRICATION OF SPUR GEARS Final Report
K. L. Wang and H. S. Cheng. Washington. Feb. 1980. 137 p. refs.

(Grant NGR-14-007-084)
(NASA-CR-3241) Avail: NTIS HC A07/MF A01 CSCL 13I

An analysis and computer program called TELSGE were developed to predict the variations of dynamic load, surface temperature, and lubricant film thickness along the contacting path during the engagement of a pair of involute spur gears. The analysis of dynamic load includes the effect of gear inertia, the effect of load sharing of adjacent teeth, and the effect of variable tooth stiffness which are obtained by a finite-element method. Results obtained from TELSGE for the dynamic load distributions along the contacting path for various speeds of a pair of test gears show patterns similar to that observed experimentally. Effects of damping ratio, contact ratio, tip relief, and tooth error on the dynamic load were examined. In addition, two dimensionless charts are included for predicting the maximum equilibrium surface temperature, which can be used to estimate directly the lubricant film thickness based on well established EHD analysis. PROGRAM TO DEVELOP SPRAYED, PLASTICALLY DEFORMABLE COMPRESSOR SHROUD SEAL MATERIALS Interim Technical Progress Report, 29 Jun. 1978 - 28 Feb. 1979
R. C. Schwab. Nov. 1979. 78 p. refs
(Contract NAS3-20054)
(NASA-CR-159741; ITPR-1) Avail: NTIS HC A05/MF A01 CSCL 11A

A study of fundamental rub behavior for ten dense sprayed materials and eight current compressor clearance materials has been conducted. A literature survey of a wide variety of metallurgical and thermophysical properties was conducted and correlated to rub behavior. Based on these results, the most promising dense rub material was Cu-9Al. Additional studies on the effects of porosity, incursion rate, blade solidity and ambient temperature were carried out on aluminum bronze (Cu-9Al-1Fe) with and without a 515B Feltmetal underlayer. CONTINUOUS SELF-LOCKING SPIRAL WOUND SEAL Patent Application
Stephen C. Irick, inventor (to NASA). Filed 20 Nov. 1979. 13 p.
(NASA-Case-LAR-12315-1; US-Patent-Appl-SN-096257) Avail: NTIS HC A02/MF A01 CSCL 11A

A spiral wound seal for effecting a seal between two surfaces is described. The seal consists of a strip of gasket material wound into a groove machined into one of the surfaces. The gasket strip is wider than the groove is deep such that a portion of the gasket material protrudes from the groove. The seal is effected by clamping the second surface onto the first surface and thereby compressing the protruding gasket material. NASA

TRIBOLOGICAL PROPERTIES OF SILICON CARBIDE IN METAL REMOVAL PROCESS
Kazuhisa Miyoshi and Donald H. Buckley. 1980. 18 p. refs
To be presented at Intern. Symp. on Metal Working Lubrication, San Francisco, 18-19 Aug. 1980; sponsored by ASME
(NASA-TM-79238) Avail: NTIS HC A02/MF A01 CSCL 13H

Material properties are considered as they relate to adhesion, friction, and wear of single crystal silicon carbide in contact with metals and alloys that are likely to be involved in a metal removal process such as grinding. Metal removal from adhesion between sliding surfaces in contact and metal removal as a result of the silicon carbide sliding against a metal, indenting into it, and plowing a series of grooves or furrows are discussed. Fracture and deformation characteristics of the silicon carbide surface are also covered. The adhesion, friction, and metal transfer to silicon carbide is related to the relative chemical activity of the metals. The more active the metal, the higher the adhesion and friction, and the greater the metal transfer to silicon carbipe. Atomic size and content of alloying elements play a dominant role in controlling adhesion, friction, and abrasive wear properties of alloys. The friction and abrasive wear (metal removal) decrease linearly as the shear strength of the bulk metal increases. They decrease as the solute to solvent atomic radius ratio increases or decreases linearly from unity, and with an increase of solute content. The surface fracture of silicon carbide is due to cleavages of 0001, 10(-1)0, and/or 11(-2)0 planes. J.M.S.

ANALYSIS OF WEAR-DEBRIS FROM FULL-SCALE BEARING FATIGUE TESTS USING THE FERROGRAPH
William R. Jones and Stuart H. Loewenthal. 1980. 22 p. refs
Prepared for presentation at the Ann. Meeting of the Am. Soc. of Lubrication Engr., Anaheim, Calif., 5-8 May 1980
(NASA-TM-81403; E-9827) Avail: NTIS HC A02/MF A01 CSCL 13H

The ferrograph was used to determine the types and quantities of wear particles generated during full-scale bearing fatigue tests. Deep-groove ball bearings made from AISI 52100 steel were used. A MIL-L-23699 tetraester lubricant was used in a recirculating lubrication system containing a 49 mm absolute filter. Test conditions included a maximum Hertz stress of 2.4 GPa, a shaft speed of 15,000 rpm, and a lubricant supply temperature of 74 C (165 F). Four fatigue failures were detected by accelerometers in this test set. In general, the ferrograph was more sensitive (up to 23 hr) in detecting spall initiation than either accelerometers or the normal spectrographic oil analysis. Four particle types were observed: normal rubbing wear particles, spheres, nonferrous particles, and severe wear (spall) fragments. Author

PERFORMANCE OF COMPUTER-OPTIMIZED TAPERED-ROLLER BEARINGS TO 2.4 MILLION DN
R. J. Parker, S. I. Pinel (Industrial Tectonics, Inc., Compton, Calif.), and H. R. Signer (Industrial Tectonics, Inc., Compton, Calif.). 1980. 29 p. refs. Proposed for presentation at the Intern. Lubrication Conf., San Francisco, 18-21 Aug. 1980; sponsored by ASME and the Am. Soc. of Lubrication Engr.
(NASA-TM-81414; E-332) Avail: NTIS HC A03/MF A01 CSCL 13I

The performance of 120.65 mm bore high speed design tapered roller bearings was investigated at shaft speeds to 20,000 rpm under combined thrust and radial load. The test bearing design was computer optimized for high speed operation. Temperature distribution and bearing heat generation were determined as a function of shaft speed, radial and thrust loads, lubricant flow rates, and lubricant inlet temperature. The roller bearing operated successfully at shaft speeds up to 20,000 rpm under heavy thrust and radial loads. Cup cooling was effective in decreasing the high cup temperatures to levels equal to the cone temperature. K.L.

FUNDAMENTALS OF PLASMA ARC WELDING Final Report, 1 Apr. 1975 - 30 Sep. 1978
C. B. Shaw, Jr. Aug. 1979. 102 p. refs
(Contract N00014-75-C-0789)
(AD-A074340; SC5031.8-F) Avail: NTIS HC A06/MF A01 CSCL 13/8

A three-year study was made of physical phenomena underlying operation of the plasma-arc welding (PAW) process. Experimental methods were developed to measure plasma spectral intensities during welding, a mathematical method was perfected to compute plasma temperature distributions from the spectral data, and statistical methods were used to extract maximum information from the data and to infer improved values for four ARII transition probabilities. Welds in mild and stainless steels and in Ti-6Al-4V up to 12.7 mm thick were evaluated by metallography and/or by cyclic fatigue studies. At low stress concentration levels, PAW was found to reduce cyclic crack growth rates in the weld metal compared to the parent metal. There appears to be evidence that plasma spectroscopy can aid in selection and control of welding parameters. The plasma temperature measurements clarify the mechanism whereby use of auxiliary ports in the PAW torch orifice cup reduces the width

of a weld nugget. Simple plasmadynamic models were used to relate orifice geometry to plasma temperature and electrical resistance, and to weld quality, thus accounting for the observation that a convergent orifice enhances weld penetration, reduces weld width, and improves weld nugget geometry without causing double-arcing, while a divergent orifice (which simulates an eroded orifice cup) has the opposite, deleterious effects. Nine documents are cited in which these results were reported and complete preprints of four journal articles not yet published are included as appendices. GRA

(AD-A074217; SKFAL79T013; USAAVRADCOM-TR-79-35) Avail: NTIS HC A06/MF A01 CSCL 13/9

This report presents the results of a survey accumulating life results achieved from bearings manufactured from M-50 tool steel. Life data have been analyzed according to an existing computer program, TABACY. Material and lubrication factors have been determined using this data base, enabling a more accurate calculation of the potential life of a bearing. In addition, this report includes experimental endurance life data obtained on three groups of rolling element bearings manufactured of Vacuum Induction Melted Vacuum Arc Remelted (VIMVAR) M-50 steel. The three bearing designs, all of which have a 45 mm internal diameter, consist of a deep groove ball, an angular contact ball, and a cylindrical roller configuration. These types have been run under several operational conditions using circulating Mobil Jet II synthetic lubricating fluid MIL-L-23699. GRA

(Contract EC-77-S-02-4191)
(COO-4191-2) Avail: NTIS HC A02/MF A01

The transparent-piston, transparent-head engine is in routine use for visualization experiments. The gaseous fuel injector is routinely used with gaseous propane as a fuel injected into the motored engine. High speed filming and short duration pulsed light single exposure techniques are being used to obtain shadow and schlieren records of gaseous and liquid jets. An LDV system for measuring in-cylinder velocities was implemented and data are presently being taken and analyzed. Engine cylinder pressure data can now be taken and reduced with the minicomputer; and an infrared emission absorption technique is used to measure engine cylinder temperature. An alternative approach to the modeling of gaseous jets yielded a characteristic time for steadying of the jet, which in the long run should allow a more efficient computational procedure. Work on the definition of appropriate equations for thick sprays continues. Visual data on engine cyclic variations were obtained with the pulsed illumination television system. DOE

METHOD OF ASSESSING THE IMPACT OF METALLURGICAL NOISE AND ITS REDUCTION IN ULTRASONIC TESTING OF AUSTENITIC WELDS
R. A. Day Aug. 1979 24 p refs Presented at the 1979 IEEE Ultrasonics Symp., New Orleans, Sep. 1979
(Contract EY-76-C-03-0893)
(GEFR-SP-164; CONF-790868-1) Avail: NTIS HC A02/MF A01

A method of reducing the ultrasonic noise, or spurious echos, often present in austenitic metals was developed. The method was used on specimens of Type 316 stainless steel, Alloy 800, 16-8-2 weld metal, and Inco-82 type weld metal, and was applied to shear wave tests. It is applicable to longitudinal wave tests. Noise in these materials was subsequently reduced relative to saw cut notches in welded samples. Signal-to-noise improvements of 8Db have been achieved in 16-8-2 weld metal, and order of magnitude improvements is obtained in the probability of large noise signals per inspection. Experiments with 1 and 1/2 megahertz inspection indicate that the improvement attributed to longitudinal wave inspection may be due to the difference in wavelength rather than wave mode. DOE

LONG LIFE HYDRAULIC BRAKE SYSTEM, SUMMARY Final Report, Oct. 1977 - Mar. 1979
R. Ziskind, I. Osofsky, Y. Mansoor, F. Oldham, and D. Couts May 1979 37 p refs
(Contract DOT-HS-7-01776)
(PB80-104730; SAI-068/80/516; DOT-HS-805-068) Avail: NTIS HC A03/MF A01 CSCL 13F

A long life brake system for passenger vehicles which would have a doubled period between required servicing in comparison to conventional systems was designed. Service life was found initially to be defined by friction pair maintenance in the 30,000 - 40,000 mile range. Subsequent servicing requirements were necessitated by a number of mechanisms derived in large part by fluid degradation, metal corrosion, and rubber deterioration. A long life design approach was specified satisfying a doubled friction pair lifetime and a 100,000 mile balance of system service-free life. Component-by-component design

approach alternatives were given and three test procedures described with which to evaluate compliance with the postulated standard. GRA

ASSEMBLY OF INTERFERENCE FITS BY IMPACT AND CONSTANT FORCE METHODS M.S. Thesis
Craig C. Selvage Jun. 1979 54 p refs
(Grant NSF APR-74-18173)
(PB-301289/5; T-693; NSF/RA-790135) Avail: NTIS HC A04/MF A01 CSCL 13H

It is shown that the Poisson effect becomes an important consideration in the assembly of interference fits when the product of Poisson's ratio, coefficient of friction, and the contact length to interference diameter ratio exceeds 0.1. The residual axial stresses resulting from assembly forces are analyzed in detail, and the minimum energy which must be supplied to begin insertion is calculated. An approximate energy analysis of the insertion of an interference fit by an impact load is presented. This analysis takes into account the presence of an axial preload force which might be applied as the impact takes place. Two experiments show a good correlation between the theory and data for impact by hammer blows. GRA

INFORMATION APPROACH TO PARTS MATING
Sergio N. Simunovic Apr. 1979 197 p refs
(Grant NSF APR-74-18173)
(PB-300519/6; NSF/RA-790134; T-690) Avail: NTIS HC A09/MF A01 CSCL 13H

The interaction of mechanical parts during the assembly process, the nature of the information available during this interaction, and the form and use of this information in aiding parts mating is examined. The development programmable industry assembly is discussed and how to determine the performance characteristics necessary for a positioning device designed for assembly is addressed. Topics discussed include: the assembly process as a positioning problem and the study of parts mating as a means of solving for this positioning problem; the transition from transporting the parts to positioning the parts for starting the assembly; the actual parts assembly or mating; and the implications of the parts mating study on the configuration of an assembly system. A description of the kinematics of rigid solids in space, a two dimensional analysis of a peg in hole insertion, theoretical performance evaluations, geometric information, experimental design, and position estimation implementation are presented. THE DEVELOPMENT OF QUANTITATIVE NDI FOR RETIREMENT-FOR-CAUSE Final Report, Sep. 1975 - Jun. 1976
J. M. Hyzak, W. H. Reiman, and J. E. Allison Feb. 1979 33 p refs
(AF Proj. 2307)
(AD-A068403; AFML-TR-78-198) Avail: NTIS HC A03/MF A01 CSCL 14/4

To investigate the viability of quantifying NDI signals, relationships between eddy current signals and flaw dimensions were examined. The prime emphasis of this report is exploring these relationships and the difficulties encountered in establishing them. A fracture mechanics/NDI-based disk rejection criteria, retirement-for-cause, which required quantitative NDI, is also described. The case of radially cracked bolt holes in a turbine disk inspected by a semiautomatic eddy current technique is used to illustrate the procedures. Monotonically increasing relationships, primarily logrithmic in nature, were observed between signal characteristics and the dimensions of EDM notches which were used to model actual cracks. Sensitivity level and eddy current system choice were observed to significantly affect the eddy current/flaw dimension relationships. Author

DIGITAL ULTRASONIC SIGNAL PROCESSING: PRIMARY ULTRASONICS TASK AND TRANSDUCER CHARACTERIZATION USE AND DETAILED DESCRIPTION Final Report
P. L. Hammond 1 Nov. 1979 560 p
(Contract NAS8-33100)

(NASA-CR-161370; Rept-79-070) Avail: NTIS HC A24/MF A01 CSCL 14D

This manual describes the use of the primary ultrasonics task (PUT) and the transducer characterization system (XC) for the collection, processing, and recording of data received from a pulse-echo ultrasonic system. Both PUT and XC include five primary functions common to many real-time data acquisition systems. Some of these functions are implemented using the same code in both systems. The solicitation and acceptance of operator control input is emphasized. Those operations not under user control are explained. A.R.H.

A MAXIMUM LIKELIHOOD ESTIMATOR FOR AN EXPONENTIAL PARAMETER FROM A LIFE TEST WITH BOTH TYPE 1 AND TYPE 2 CENSORING

Kenneth B. Fairbanks Aug. 1979 36 p refs

(Contract N00014-76-C-0789)

(AD-A073895; TR-86) Avail: NTIS HC A03/MF A01 CSCL 12/1

A hybrid life test on items assumed to have an exponential lifetime combines type 1 and type 2 censoring. In type 1 censoring, n items are placed on test and observed for a fixed time t^*, while in type 2 censoring the test terminates with the rth sub 0 failure, where r sub 0 is a preassigned integer. If t sub r sub 0 is the time of the rth sub 0 failure, a hybrid life test terminates at min(t sub r sub 0, t^*). In some situations it may be of interest to estimate the average lifetime theta, following the test decision. In this report, we find the maximum likelihood estimator, theta-cap, when the sample is subject to hybrid censoring. An expression for E(theta-cap) is derived. Because this expression is complex, computer simulations are used to examine the bias of theta-cap. GRA

CONFIDENCE INTERVALS FOR AN EXPONENTIAL PARAMETER FROM A TWO STAGE LIFE TEST

Kenneth B. Fairbanks Aug. 1979 34 p refs

(Contract N00014-76-C-0789)

(AD-A073896; TR-87) Avail: NTIS HC A03/MF A01 CSCL 12/1

The two stage life test of Bulgren and Hewett (1973) for the mean lifetime, theta, of an exponentially distributed lifetime is essentially a two stage version of type 2 censoring. Since the test decision only determines whether theta is above or below theta sub 0, it may be of interest to estimate theta following the decision using the test data. Epstein (1960a) found confidence intervals for under type 2 censoring. This report shows that Epstein's intervals may be modified slightly and used to provide confidence intervals for theta following the two stage test. The resulting confidence intervals are shown to be conservative.GRA

APPROXIMATE CONFIDENCE INTERVALS FOR AN EXPONENTIAL PARAMETER FROM A SEQUENTIAL LIFE TEST

Kenneth B. Fairbanks Aug. 1979 37 p refs

(Contract N00014-76-C-0789)

(AD-A073897; TR-88) Avail: NTIS HC A03/MF A01 CSCL 12/1

A sequential life test for the exponential location parameter was given by Epstein and Sobel (1955). This sequential test may be modified by truncating the test at r sub 0 failures and/or at total test time t'. There may be a need or a desire to also estimate the parameter after the test decision, using the test data. Bryant and Schmee (1979) have given confidence intervals for the mean lifetime, theta, from a truncated sequential test scheme, using methods which depend heavily on numerical techniques using a computer. A more flexible approach is considered using a martingale inequality which was also given by Wald (1947) in another context. Interval estimates are found which are functions of a positive constant d which must be chosen less than an upper bound which is itself a function of the number of failures observed. It is suggested that d be chosen as a function of the sample path (i.e., after the test is complete). The validity of the confidence coefficient comes into question if this posterior selection of d is employed. Simulation studies indicate that the resulting intervals are usually conservative. EFFICIENT PROCEDURE FOR SELECTING AMONG FIVE RELIABILITY MODELS Ph.D. Thesis

J. E. A. Kent (Nucl. Regulatory Comm.) Oct. 1979 228 p refs

(Contract W-7405-eng-26)

(ORNL/CSD-43) Avail: NTIS HC A11/MF A01

Several parametric families of probability distributions used to model reliability and life testing data are considered. An efficient technique for selecting the best fitting family of distributions is derived. This technique uses scale-invariant statistics that minimize the probabilities of misclassification, and is extended beyond pairwise selections to selecting from a class of families of competing distributions. These statistics are not used in the hypothesis testing framework, but rather as measures of likelihood that the observed data have a distribution from a farticular family of probability distributions. The class of families considered are the Uniform, Exponential, Gamma, Weibull, and Lognormal distributions, for the cases of shape parameters both known and unknown. Results of computer simulations are given for pairwise and multiple family selection procedures, showing the misclassification error rates achieved for selected sample sizes. Illustrations based on actual data are presented, along with a user program for convenient implementation of this procedure. DOE

SOME APPROXIMATIONS IN VIBRATIONS AND WAVE MOTION OF ELASTIC MEDIA Ph.D. Thesis
Michael Yvon Rondeau 1979 98 p
Avail: Univ. Microfilms Order No. 8001583

A study of wave propagation phenomena in a linear, elastic, isotropic, homogeneous layer is presented. The motion is described by the integral method of Kirchhoff derived through Hamilton's principle, which serves as the starting point for various approximations to be developed. A series expansion procedure coupled with a new truncation concept is used to construct two dimensional partial differential equations for motions in the layer. Frequency spectra associated with traveling waves in a traction free layer are studied and compared with the spectra preductions of Medick, Nikodem and that of the three-dimensional theory. Impact boundary conditions are applied at the top of the plate and free stresses are applied at the bottom of the plate. The Differential-Difference equations are reduced to Difference equation. Dissert. Abstr.

A DIFFERENTIAL GEOMETRIC APPROACH TO MATERIAL DEFORMATION Ph.D. Thesis
Edward Marinus Olsen 1979 188 p
Avail: Univ. Microfilms Order No. 8001981

An appropriate language to discuss nonlinear material deformation is differential geometry, as the analysis can establish kinematical quantities in a coordinate-free description. The material kinematical description proceeds first with a metric free or affine analysis. The configuration space of material deformation is expressed in terms of the geometric quantities of torsion and curvature. The introduction of a mentric goes beyond the usual definitions in Riemannian geometry and allows Ricci's lemma to be violated. A nonmetric quantity is introduced which describes the failure of length to be invariant to parallel transport. The configuration space is then described as a nonmetric nonRiemannian space. The understanding of local material yielding and fracture using a global analysis is mathematically developed using path independent integrals of the appropriate field quantities. Material deformation is the movement of a point on a hypersurface having variables to describe yielding, fracture and unloading. Dissert. Abstr.

DYNAMIC YIELDING OF POLYCRYSTALLINE MATERIALS UNDER BIAXIAL LOADING Ph.D. Thesis
Daniel Hon-Ying Ng 1979 285 p
Avail: Univ. Microfilms Order No. 8002619

The dynamic responses as well as static initial and subsequent yield surfaces of a number of specimens made of 6061-T6 aluminum alloy are presented. The stress path obtained in a dynamic biaxial test are reproduced statically. Thd corresponding stress-strain curves are compared and found significantly different. It is found that the dynamic initial yielding occurs at a higher state of biaxial stress depending on the loading rate than that of static yielding. The experimental results are used to verify a set of plastic strain rate equations formulated by analyzing dislocation dynamics through a statistical approach. The theoretical axial and hoop plastic strain rates obtained by the rate equations are found to be in reasonable agreement with the experimental results. Dissert. Abstr.

N80-16367 Stanford Univ., Calif.
ACOUSTOELASTIC ANALYSIS OF CENTER-CRACKED PANELS Ph.D. Thesis
John Bradley Croom Hunter 1979 89 p
Avail: Univ. Microfilms Order No. 8001940

Mechanical and electronic systems were developed for accurate measurement of sound speed variation for longitudinal acoustic waves in uniaxial tensile specimens and stressed panels. Pulse superposition techniques were used in measuring acoustic velocity changes with applied load. These measurements were used for characterization of acoustoelastic response for aluminum and steel alloys. For elastic loading, the velocity changes proportionally with the sum of the inplane principal stresses. This is in agreement with theoretical prediction and is a key result that permits acoustoelastic stress measurement. Stress field measurements were made using the acoustic technique and the uniaxial results for calibration. Loaded panel specimens containing cracks, notches and a central hole were examined and the results compared with theoretical elastic solutions. A technique for extracting the stress intensity factors from acoustoelastic stress measurements around a crack in a loaded panel is described. Dissert. Abstr.

N80-16368 Washington Univ., Seattle.
DYNAMIC ANALYSIS OF SHELLS OF REVOLUTION-SOIL SYSTEMS Ph.D. Thesis
Osama Moustafa El-Shafee 1979 228 p
Avail: Univ. Microfilms Order No. 8001220

A finite element model was developed to analyze shells of revolution under dynamic loading with soil-structure interaction effects. The model consists of high-precision rotational shell finite elements, representing the axisymmetric shell, supported on an equivalent boundary system, representing the soil medium. The substructure method is used to model the shell and soil components. In addition to the seismic analysis capability of the proposed model, it is also applicable to other dynamic loads such as wind. The dynamic behaviour of a hyperboloidal cooling tower shell on discrete supports with a ring footing is studied. Dynamic properties are studied and stress analysis is carried out for a variety of soil conditions. Dissert. Abstr.

N80-16369 Case Western Reserve Univ., Cleveland, Ohio.
STEADY STATE RESPONSE OF A CIRCULAR FOUNDATION ON A TRANSVERSELY ISOTOPIC MEDIUM Ph.D. Thesis
David John Kirkner 1979 233 p
Avail: Univ. Microfilms Order No. 8001463

Dimensionless parameters which are functions of the elastic constants are utilized to define the degree of anisotropy when the foundation investigated is undergoing vertical, rocking or translational vibrations. Impedance and compliance coefficients are presented in tables and curves for a wide range of a dimensionless frequency parameter. Approximate impedance and compliance coefficients are also obtained for a viscoelastic soil. For massive foundations undergoing harmonic vibrations, the dimensionless part of the isotropic impedance function may be used with the expression for the anisotropic static stiffness to obtain the amplitude of vibration. A dimensionless parameter determines the Poisson's ratio of the equivalent isotropic soil. The result is important for the design of machine foundations since it allows for an approximate analysis by using the available isotropic solutions. Dissert. Abstr.

N80-16370 Virginia Univ., Charlottesville.
STRESS SINGULARITIES AT THE CORNERS OF A SEMI-INFINITE STRIP Ph.D. Thesis
William Richard Stout 1979 42 p
Avail: Univ. Microfilms Order No. 8002522

The problem delta delta W(x,y) = 0 in the semi-infinite strip 0 < x < 1 and 0 < y, subject to the boundary conditions: W(0,y) = W sub x (0,y) = 0 W(1,y) = W sub x (1,y) = 0 W(x,0) = 0 W sub y (x,0) = h(x) is considered. The problem is decomposed into its even and add parts about x = 1/2, and the analysis is carried out for the even part. A relation is derived connecting W(x,y) and the solution u(x,y) of a related harmonic problem delta u(x,y) with boundary conditions derived from those for W(x,y). An integral containing the singular part of u(x,y) is obtained. A harmonic boundary value problem is then derived for the singular part of u. Dissert. Abstr.

N80-16371 Stanford Univ., Calif.
THE USE OF STRESS CHANGE EXPERIMENTS TO STUDY THE MECHANISMS OF ELEVATED TEMPERATURE DEFORMATION Ph.D. Thesis

Jeffrey Clarke Gibeling 1979 377 p
Avail: Univ. Microfilms Order No. 8001923

The interpretation of stress change experiments in terms of dislocation creep mechanisms is studied. The development of techniques for high precision and conventional resolution strain transient measurements is described. These methods are applied to the study of polycrystalline aluminum, copper and lead as well as single crystals of aluminum and lead. Evidence of instantaneous dislocation motion and measurements of the time dependent strains are discussed along with the nature of apparent delay times and creep anelasticity. Conclusions are presented.
Dissert. Abstr.

N80-16372 Engineering Sciences Data Unit, London (England).
ELASTIC STRESS CONCENTRATION FACTORS: RECTANGULAR NOTCH IN THE EDGE OF A WIDE FLAT PLATE IN TENSION
Jul. 1979 2 p
(ESDU-79008; ISBN-0-85679-253-5) For information on availability of series, sub-series, or individual data items, write NTIS, Attn: ESDU, Springfield, Va. 22161 HC $50.50

Data is provided on the maximum stress at rectangular notches in the side of plates subjected to tensile loading. Typical applications are plates or bars in machinery or structures. The range of applicability is for rectangular notches having a width to depth ratio in the range 0.4 to 10.0 and a corner radius to depth ratio in the range 0.2 to 1.0.

THE FREE VIBRATION EQUATIONS, NATURAL FREQUENCIES AND MODAL CHARACTERISTICS OF CLOSED CIRCULAR CYLINDRICAL SHELLS
Tatsuzo Koga and Keiji Komatsu Apr. 1979 45 p refs
(NAL-TR-569T) Avail: NTIS HC A03/MF A01

The relative accuracies of the representative classical theories of thin shells are examined. The order of magnitude comparison of terms involved in the governing equations for the free vibrations of a circular cylindrical shell is the method utilized. The boundary conditions for the shells are taken into account and it is shown that the classical theories yield valid solutions accurate enough when taking into consideration the errors inherent in the Kirchhoff-Love hypothesis. A first approximation, consistent with the order of magnitude estimate, leads to a system of free vibration and boundary constraining equations. The approximation enabled a qualitative estimate of the forms of the characteristic solutions. The accuracy of the Donnell type approximation is investigated and a detailed account of the historical developments of the subject is provided.

INITIAL IMPERFECTION MEASUREMENTS OF INTEGRALLY STRINGER-STIFFENED CYLINDRICAL SHELLS
J. Singer, H. Abramovich, and R. Yaffe Dec. 1978 124 p refs
(TAE-330) Avail: NTIS HC A06/MF A01

The initial geometric imperfections of integrally stringer stiffened cylindrical shells were measured in a special scanning system, on laboratory scale. The system consists essentially of a probe, travelling along a helical path inside the shell, whose output is recorded digitally on a minicomputer. The imperfection measurements of 19 shells, employed in different test programs, are presented both in graphical form and as coefficients of Fourier series - a proposed standard representation for imperfection data.

A PENALTY PLATE-BENDING ELEMENT FOR THE ANALYSIS OF LAMINATED ANISOTROPIC COMPOSITE PLATES
J. N. Reddy Aug. 1979 36 p refs
(Contract N00014-78-C-0647)
(AD-A074236; OU-AMNE-79-14; TR-6) Avail: NTIS HC A03/MF A01 CSCL 12/1

A C degrees (penalty) finite element is developed for the equations governing the heterogeneous laminated plate theory of Yang, Norris and Stavsky. The YNS theory is a generalization of Mindlin's theory for homogeneous, isotropic plates to arbitrarily laminated anisotropic plates and includes shear deformation and rotary inertia effects. The present element can also be used in the analysis of thin plates by appropriately specifying the penalty parameter. A variety of problems are solved, including those for which solutions are not available in the literature, to show the material effects and the parametric effects of plate aspect ratio, length-to-thickness ratio, lamination scheme, number of layers and lamination angle on the deflections, stresses, and vibration frequencies. Despite its simplicity, the present element gives very accurate results.

INVESTIGATION OF THE SUITABILITY OF THE BAZANT ENDOCHRONIC MATERIAL MODEL FOR MODELLING THE CONCRETE IN A SAMSON ANALYSIS OF A REINFORCED CONCRETE BEAM Final Report, Jan. - May 1979
James W. Jeter, Jr. Jul. 1979 20 p refs
(Grant AF-AFOSR-0066-79; AF Proj. 2307)
(AD-A074202) Avail: NTIS HC A02/MF A01 CSCL 13/3

This investigation involved evaluating the potential of the Bazant endochronic plain concrete model as a possible avenue to an accurate model of the behavior of dynamically loaded reinforced concrete structures. A previous attempt to apply this model to the problem of a dynamically loaded beam was unsuccessful, due to an instability in the computer formulation of the model. In this study it was found that interaction between the tensile cracking model and the SAMSON nonlinear dynamic finite element structural analysis program used for the beam analysis problem resulted in inconsistent definition of the strain behavior experienced by the material, thereby producing instability. A procedure was developed and demonstrated, which successfully eliminated the instability.

HC A05/MF A01 CSCL 13/13

A series of design oriented equations to predict the tripping (lateral-torsional instability) of stiffeners under inplane and lateral loads has been developed which will allow this mode of failure to be more comprehensively addressed in the early stages of structural design. This type of failure is characterized by a twisting of the stiffener about its line of attachment to the plating and has been demonstrated by some recent British grillage tests to have serious potential as a primary mode of failure. The solutions developed take into account the effects of the rotational resistance provided by the plating to which the stiffener is attached, non-linear material and structural behavior by means of a tangent modulus type approach, and stiffener web deformations (for inplane loading). The equations are suitable for manual calculations but particularly powerful applications are possible when they are teamed up with a desk-top type mini-computer. GRA

STRUCTURE INELASTICITY 24. EXAMPLES OF NON-UNIQUENESS IN CONTAINED PLASTIC DEFORMATION

Philip G. Hodge, Jr. and David L. White Jul. 1979 21 p

(Contract N00014-75-C-0177)

(AD-A074727; AEM-H1-24) Avail: NTIS HC A02/MF A01 CSCL 20/11

It is well known that in a well-defined boundary-value problem for an elastic/perfectly-plastic structure the displacements are unique if the structure is everywhere elastic, and they are not unique at the yield-point load. The present paper is concerned with the range of contained plastic deformation between these two extremes. Several examples are given in which more than one displacement field exists for loads less than the yield-point load. The significance of this phenomenon is commented on from a physical, mathematical, and computational point of view. GRA

ENERGY DISPERSION AND RELAXATION IN PROPYNAL USING LASER IR/VISIBLE DOUBLE RESONANCE

M. L. Lesiecki, G. R. Smith, J. A. Stewart, and W. A. Guillory 1979 17 p refs Presented at the 14th European Congr. on Molecular Spectry., Frankfort, 3 Sep. 1979

(Contract ER-78-S-02-4695)

(COO-4695-2; CONF-790919-1) Avail: NTIS HC A02/MF A01

The dynamics of energy dispersion in propynal were studied over the pressure range of 5 to 500 mtorr following excitation by a TEA CO2 laser below the dissociation threshold. Wavelength resolved spectra, using the dye laser-induced fluorescence technique, are used to characterize the vibrational levels that are involved in the various energy transfer processes, while time-resolved spectra are used to determine the corresponding rates. The rate constants are extrapolated to zero pressure to obtain the regime of collisionless intramolecular relaxation time. Mechanisms of energy dispersion involving each of the probed vibrational levels are discussed. DOE

EFFECTS OF CRACKS ON THE RESPONSE OF SHELL STRUCTURES

H. J. Petroski 1979 10 p refs Presented at Intern. Conf. on Structural Mech. in Reactor Technol., Berlin, 13 Aug. 1979

(Contract W-31-109-eng-38)

(CONF-790802-57) Avail: NTIS HC A02/MF A01

A simple model that predicts the effects of axial cracks on the elastic deformation of thin cylindrical shells is developed. The model employs Fourier series representations for the deformation components of the shell and represents a crack by pairs of concentrated couples at the crack location. These couples induce bending modes of deformation, with the lower order bending modes dominating the response. Hence excellent results can be obtained with only about 25 bending models superimposed on the axisymmetric breathing mode, which alone characterizes the response of an uncracked shell to an axisymmetric pressure load. The model can be calibrated from a single static finite element analysis of the shell of interest. The calibrated model then accurately predicts the effects of different numbers, sizes, and locations of cracks under both static and dynamic loading of the shell. DOE

INFLUENCES OF THE COUPLE-STRESSES ON THE PURE-BENDING OF A CIRCULAR CYLINDER

B. G. Kao, F. K. Tzung, and F. H. Ho Jul. 1979 46 p refs

(Contract EY-76-C-03-0167)

(GA-A-15141) Avail: NTIS HC A03/MF A01

The solution to the pure-bending of a circular cylinder with the couple-stress theory of linear elasticity is presented. A linear bending moment-curvature relation is derived parallel to the classical beam theory. The section modulus (or the proportional coefficient) associated with the couple-stress theory is always greater than that predicted by the classical theory, and the ratio of the former to the latter increases as the radius of the beam decreases. These aspects clearly agree with the observed behavior of nuclear-grade graphite. Based on the solution, it is further estimated that the characteristic length of the couple-stress theory for H-451 graphite ranges from 0.62 to 1.54 mm. This range concurs with the magnitude of the grain size (maximum is 1.57 mm for H-451 graphite) and agrees with an aspect of the couple-stress theory. DOE

LIMITATIONS AND CORRECTIONS IN MEASURING DYNAMIC CHARACTERISTICS OF STRUCTURAL SYSTEMS

P. L. Walter Oct. 1978 250 p refs

(Contract EY-76-C-04-0789)

(SAND-78-1015) Avail: NTIS HC A11/MF A01

Limitations encountered in measuring the dynamic characteristics of structural systems are discussed. Structural loading and response were measured by transducers possessing multiple resonant frequencies in their transfer function. In transient environments, the resultant signals from these transducers are shown to be analytically unpredictable in amplitude level and frequency content. Data recorded during nuclear effects simulation testing on structures were analyzed. Results of analysis can be generalized to any structure which encounters dynamic loading. Methods to improve the recorded data are described which can be implemented on a frequency selective basis during the measurement process. These improvements minimize data distortion attributable to the transfer characteristics of the measuring transducers. DOE

CONSISTENT CREEP AND RUPTURE PROPERTIES FOR CREEP-FATIGUE EVALUATION
C. C. Schultz 1978 80 p refs Presented at the ASME Meeting, San Francisco, 10 Dec. 1978
(Contract EY-76-C-15-0003)
(CONF-781202-21) Avail: NTIS HC A05/MF A01

The currently accepted practice of using inconsistent representations of creep and rupture behaviors in the prediction of creep-fatigue life is shown to introduce a factor of safety beyond that specified in current ASME Code design rules for 304 stainless steel Class 1 nuclear components. Accurate predictions of creep-fatigue life for uniaxial tests on a given heat of material were obtained by using creep and rupture properties for that same heat of material. The use of a consistent representation of creep and rupture properties for a minimum strength heat is also shown to provide adequate predictions. The viability of using consistent properties (either actual or those of a minimum heat) to predict creep fatigue life thus identifies significant design uses for the results of characterization tests and improved creep and rupture correlations. TENSILE CRACKS IN CREEPING SOLIDS
H. Riedel (Max-Planck-Institut feur Eisenforschung, Dusseldorf) and J. R. Rice Feb. 1979 34 p refs
(Contract EY-76-S-02-3084)
(COO-3084-64) Avail: NTIS HC A03/MF A01

The loading parameter determining the stress and strain fields near a crack tip, and thereby the growth of the crack, under creep conditions is discussed. Relevant loading parameters considered are the stress intensity factor K/sub I/, the path-independent integral C*, and the net section stress sigma/sub net/. The material behavior is modelled as elastic-nonlinear viscous where the nonlinear term describes power law creep. At the time t = 0 load is applied to the cracked specimen, and in the first instant the stress distribution is elastic. Subsequently, creep deformation relaxes the initial stress concentration at the crack tip, and creep strains develop rapidly near the crack tip. Besides several methods of estimating the creep zone size, a convenient expression for a characteristic time is derived, which characterizes the transition from small scale yielding to extensive creep of the whole specimen. OPTIMIZATION TECHNIQUES AND NUMERICAL METHODS FOR AQUIFER MANAGEMENT Ph.D. Thesis
Eduardo A. Aguado 1979 189 p
Avail: Univ. Microfilms Order No. 8002308

Integrated, self-contained models in which the physical behavior and functioning of the groundwater system is truly part of the optimization management model were developed. The partial differential equations describing groundwater flow are approximated by finite differences and the resulting linear algebraic simultaneous equations are imbedded as constraints in a linear programming formulation which can include economical, political, or social, quantifiable decision variables and constraints. The optimal plan for dewatering a construction site is determined and the method is applied to a conceptual, medium-sized sea-water intrusion problem. The optimal strategy for preventing encroachment of sea water in a coastal aquifer while maintaining fresh-water extraction at prescribed levels, is also determined.

MEASUREMENT OF EDDY DIFFUSIVITY AND SOLUTE TRANSPORT THROUGH THE NEAR-SEDIMENT BOUNDARY LAYER OF ICE-COVERED LAKES, USING RADON-222 Ph.D. Thesis
John Ammiel Colman 1979 222 p
Avail: Univ. Microfilms Order No. 7927166

A technique for calculating vertical solute transport through the benthic boundary layer using a mathematical comparison of solute and Rn-222 profiles was investigated. The profile comparison was based on relating the vertical eddy diffusivities calculated from the Rn-222 profiles to the depth gradient of a solute's concentration. The relationship between vertical solute transport and solute flux through the sediment-water interface was also investigated. The sediment contribution during the winter to the net change in solute standing crop was computed from water column solute budgets and compared to changes predicted from vertical solute transport calculations. The comparison indicates some solutes released from the sediments during the winter period are not conservative in the water column.

The author has identified the following significant results. A comparison of snowmelt runoff models shows that the accuracy of the Tangborn model and regression models is greater if the test data falls within the range of calibration than if the test data lies outside the range of calibration data. The regression models are significantly more accurate for forecasts of 60 days or more than for shorter prediction periods. The Tangborn model is more accurate for forecasts of 90 days or more than for shorter prediction periods. The Martinec model is more accurate for forecasts of one or two days than for periods of 3,5,10, or 15 days. Accuracy of the long-term models seems to be independent of forecast data. The sufficiency of the calibration data base is a function not only of the number of years of record but also of the accuracy with which the calibration years represent the total population of data years. Twelve years appears to be a sufficient length of record for each of the models considered, as long as the twelve years are representative of the population.

A SPECTRAL FILTER FOR ESMR'S SIDELOBE ERRORS
Dennis Chesters Sep. 1979 26 p refs
(NASA-TM-80555) Avail: NTIS HC A03/MF A01 CSCL 08B

Fourier analysis was used to remove periodic errors from a series of NIMBUS-5 electronically scanned microwave radiometer brightness temperatures. The observations were all taken from the midnight orbits over fixed sites in the Australian grasslands. The angular dependence of the data indicates calibration errors consisted of broad sidelobes and some miscalibration as a function of beam position. Even though an angular recalibration curve cannot be derived from the available data, the systematic errors can be removed with a spectral filter. The 7 day cycle in the drift of the orbit of NIMBUS-5, coupled to the look-angle biases, produces an error pattern with peaks in its power spectrum at the weekly harmonics. About plus or minus 4 K of error is removed by simply blocking the variations near two- and three-cycles-per-week. R.E.S.

THE DIELECTRIC PROPERTIES OF SOIL-WATER MIXTURES AT MICROWAVE FREQUENCIES
J. R. Wang Dec. 1979 24 p refs Submitted for publication
(NASA-TM-80597) Avail: NTIS HC A02/MF A01 CSCL 08M

Recent measurements on the dielectric constants of soil-water mixtures show the existence of two frequency regions in which the dielectric behavior of these mixtures was quite different. At the frequencies of 1.4 GHz to 5 GHz, there were strong evidences that the variations of the dielectric (epsilon) with water content (W) depended on soil type. While the real part of epsilon for sandy soils rose rapidly with the increase in W, epsilon for the high-clay content soils rose only slowly with W. As a consequence, epsilon was generally higher for the sandy soils than for the high-clay content soils at a given W. On the other hand,

most of the measurements at frequencies < 1 GHz indicated the increase of epsilon with W independent of soil types. At a given W, epsilon' (sandy soil) approximately equals epsilon (high-clay content soil) within the precision of the measurements. These observational features can be satisfactorily interpreted in terms of a simple dielectric relaxation model, with an appropriate choice of the mean relaxation frequency f(m) and the range of the activation energy (beta). It was found that smaller f(m) and larger beta were required for the high-clay content soils than the sandy soils in order to be consistent with the measured data. Author

L-BAND RADAR SENSING OF SOIL MOISTURE
A. T. C. Chang, S. Atwater (California Univ., Santa Barbara), V. V. Salomonson, J. E. Estes (California Univ., Santa Barbara), D. S. Simonett (California Univ., Santa Barbara), and M. L. Bryan (JPL) Jan. 1980 32 p refs Submitted for publication
(NASA-TM-80628) Avail: NTIS HC A03/MF A01 CSCL 08M

The performance of an L-band, 25 cm wavelength imaging synthetic aperture radar was assessed for soil moisture determination, and the temporal variability of radar returns from a number of agricultural fields was studied. A series of three overflights was accomplished over an agriculutural test site in Kern County, California. Soil moisture samples were collected from bare fields at nine sites at depths of 0-2, 2-5, 5-15, and 15-30 cm. These gravimetric measurements were converted to percent of field capacity for correlation to the radar return signal. The initial signal film was optically correlated and scanned to produce image data numbers. These numbers were then converted to relative return power by linear interpolation of the noise power wedge which was introduced in 5 dB steps into the original signal film before and after each data run. Results of correlations between the relative return power and percent of field capacity (FC) demonstrate that the relative return power from this imaging radar system is responsive to the amount of soil moisture in bare fields. The signal returned from dry (15% FC) and wet (130% FC) fields where furrowing is parallel to the radar beam differs by about 10 dB. A.R.H.

SYNTHETIC APERTURE RADAR/LANDSAT MSS IMAGE REGISTRATION
H. E. Maurer, ed., J. D. Oberholtzer, ed., and P. E. Anuta, ed. (Purdue Univ.) Jun. 1979 233 p Sponsored in part by Goodyear Aerospace Corp. Original contains color illustrations
(Contracts NAS6-2816; NAS6-2827)
(NASA-RP-1039) Avail: NTIS HC A11/MF A01 CSCL 17I

Algorithms and procedures necessary to merge aircraft synthetic aperture radar (SAR) and LANDSAT multispectral scanner (MSS) imagery were determined. The design of a SAR/LANDSAT data merging system was developed. Aircraft SAR images were registered to the corresponding LANDSAT MSS scenes and were the subject of experimental investigations. Results indicate that the registration of SAR imagery with LANDSAT MSS imagery is feasible from a technical viewpoint, and useful from an information-content viewpoint. J.M.S.

RADIATIVE TRANSFER MODELING APPLIED TO SEA WATER CONSTITUENT DETERMINATION
Kenneth H. Faller Dec. 1979 171 p
(NASA-TM-72736) Avail: NTIS HC A08/MF A01 CSCL 08J

Optical radiation from the sea is influenced by pigments dissolved in the water and contained in discrete organisms suspended in the sea, and by pigmented and unpigmented inorganic and organic particles. The problem of extracting the information concerning these pigments and particulates from the optical properties of the sea is addressed and the properties which determine characteristics of the radiation that a remote sensor will detect and measure are considered. The results of the application of the volume scattering function model to the data collected in the Gulf of Mexico and its environs indicate that the size distribution of the concentrations of particles found in the sea can be predicted from measurements of the volume scattering function. Furthermore, with the volume scattering function model and knowledge of the absorption spectra of dissolved pigments, the radiative transfer model can compute a distribution of particle sizes and indices of refraction and concentration of dissolved pigments that give an upwelling light spectrum that closely matches measurements of that spectrum at sea. A.R.H.

VERIFICATION PROCEDURES FOR THE SEASAT MEASUREMENTS OF THE VECTOR WIND WITH THE SASS
Willard J. Pierson Jan. 1978 39 p refs Sponsored by NASA Prepared for JPL
(Contracts JPL-954411; N00014-77-C-0206)
(NASA-CR-162469; AD-A073644) Avail: NTIS HC A03/MF A01

Various relationships between the friction velocity and the roughness length in boundary layer models are studied in terms of the verification of the SASS on SEASAT. It is shown that verification against a measured wind at a known anemometer height is preferable to verification against a theoretical value of the friction velocity. The effect of the different models is small when they are used to refer all measured winds to one elevation. A model is proposed that has the features of two quite different models and the height of the anemometer for verification purposes is recommended to be 19.5 meters. GRA

REMOTE SENSING FOR DIAGNOSING VAPOR DISPERSION IN SPILLS OF LIQUID ENERGY FUELS
L. G. Multhauf, A. M. Frank, and R. O. Koopman 23 Aug. 1979 53 p
(Contract W-7405-eng-48)
(UCID-18237) Avail: NTIS HC A04/MF A01

The measurement of gas concentrations in Liquid Energy Fuel (LEF) dispersion clouds by remote LIDAR sensing is an attractive alternative to the use of in situ instruments in regions where the gas concentration level is low. A comparison of Raman and DIAL LIDAR shows that Raman LIDAR is best suited to measure the concentration levels of interest in the LEF program. The LIDAR systems are limited primarily by the opaque fog produced by the evaporation of a cryogenic liquid fuel. The limitation is most severe for methane, for which LIDAR is not useful for concentrations above the flammability range. However, it is this low concentration region that the spatial extent of the cloud is large and not easily covered with an array. A fence of in situ instruments proposed for 40 cu m spills at China Lake (a row of 10 in situ instrument stations) and a Raman LIDAR system of similar cost designed to cover the same area of the cloud were compared. LIDAR offers substantially higher spatial resolution and coverage that better allows for wind variations. DOE

STUDY OF HYDROCARBON-SHALE INTERACTION
Progress Report, 1 Apr. - 30 Jun. 1979
P. D. Schettler, Jr. and D. L. Wampler 1979 50 p refs
(Contract EY-76-S-05-5197)
(ORO-5197-14; PR-14) Avail: NTIS HC A03/MF A01

Construction of an apparatus for degasibility/isotherm measurements up to 1000 psi is complete. Results of chromatographic analysis of off-gassing from wells KY No. 4-, PA No. 1-, PA No. 2-, OH No. 3-, and IL No. 4-EGSP are tabulated. Temperature coefficients of degasibility and isotherm parameters in Devonian shales were determined. A summary of degasibility/isotherm data is presented. A computer simulation of a matrix diffusion/fracture flow model in the radial case is discussed. A small infrared/X-ray diffraction study is proceeding on selected samples. DOE

N80-16410# Department of Energy, Morgantown, W. Va. Energy Technology Center.
GAS PRODUCTION OF DEVONIAN SHALE WELLS RELATIVE TO PHOTO LINEAMENT LOCATIONS: A STATISTICAL ANALYSIS

J. F. Howard (Howard and Associates, Owensboro, Ky.), S. J. Lahoda (West Virginia Univ., Morgantown), W. E. Zirk (West Virginia Univ., Morgantown), and C. A. Komar Apr. 1979 19 p refs
(METC/CR-79/28) Avail: NTIS HC A02/MF A01

A pilot study was made to relate Devonian shale gas well production to distance from photo lineaments that were mapped at two different scales, namely low altitude (1:24,000) and intermediate altitude (1:62,500). Cumulative production after 5 years for 41 wells located in the Vicco quadrangle of Perry Co., Kentucky, was used in the study. A statistical two-way analysis of variance design was used to group the data into four classes depending on whether the producing wells were within or beyond 300 feet of a photo lineament derived from both scales. Results indicate that cumulative 5 year production is higher for wells sited within 300 feet of a low-altitude photo lineament. The correlations indicate a narrow zone of influence or effect for the geologic feature represented by the photo lineament. Moreover, the most consistently effective features are derived from low-altitude (1:24,000) scale photography, well below the detail commonly utilized in studies to date. DOE

ENVIRONMENTAL DEVELOPMENT PLAN: UNDERGROUND COAL GASIFICATION
Sep. 1979 76 p Sponsored by DOE, Washington, D.C.
(DOE/EDP-0047) Avail: NTIS HC A05/MF A01

Early tests indicate that some of the groundwater pollution due to underground coal gasification (UCG) is confined to an area adjacent to the gasified zone and the cleansing properties of the surrounding coal may serve as a natural contaminant control system. Ground subsidence is another major concern. Subsidence could cause disruption of aquifers, surface disturbance, and loss of product gas through cracks to the surface. Degradation of air quality is also a significant concern particularly with respect to emissions through cracks and fissures resulting from anticipated subsidence. Potential hazards to the worker exist, including the inadvertent release of gas through cracks in the ground surface and worker safety associated with the sudden collapse through subsidence. Environmental regulations which will most directly affect the UCG program include the Federal Water Pollution Control Act, the Safe Drinking Water Act, and the Clean Air Act. These regulations will impact upon pollution control requirements, and potential siting of facilities. DOE

COLLECTION AND ANALYSIS OF VEGETATIVE COVER DATA
R. H. Sauer and S. L. Owzarski Jul. 1979 24 p refs
(Contract EY-76-C-06-1830)
(PNL-3068) Avail: NTIS HC A03/MF A01

The rationale, methods, and analytic tools that are commonly used to study changes in vegetation on the Hanford Site are discussed. The method of vegetation analysis that has been successful in the Columbia Basin in Washington State is Daubenmire's (1959) canopy cover approach. Six classes are recognized in use. The percentage cover of each species present is estimated and placed in one of the six classes. The advantage of placing the cover of a species into broad classes instead of making more accurate estimates is that it allows faster data collection. The error is reduced with many samples (usually 50) because the actual value in some samples will be less than the midpoint, and others, greater than the midpoint. The midpoint value is used to calculate the statistics of canopy cover. A FORTRAN listing of the program cover and sample output, consisting of a data listing, frequency, cover statistics, and species diversity for each line is given in the appendix. DOE

BACKSCATTER RESPONSE OF SNOW COVERED ROADS AND ROADSIDE SURFACES
F. T. Ulaby and W. H. Stiles Aug. 1979 67 p refs
(Contract EY-76-C-04-0789)
(SAND-79-7046; RSL-TR-377-2) Avail: NTIS HC A04/MF A01

The angular response of the backscatter coefficient for snow covered targets was measured with a microwave action spectrometer. Snow under varying conditions on compacted dirt, short grass, asphalt and concrete surfaces was observed. The measurements were made for three linear polarizations (HH, HV, and VV) and at three frequencies (8.6, 17.0 and 35.6 GHz). The data was compared with measurements in the absence of snow. The general effect of wet or dry snow was observed to be a decrease in the total response dynamic range and therefore an increased difficulty in target discrimination. DOE

N80-16414# Geological Survey, Harrisburg, Pa. Water Resources Div.
FLOW ROUTING IN THE SUSQUEHANNA RIVER BASIN. PART 2: LOW-FLOW FREQUENCY CHARACTERISTICS OF THE SUSQUEHANNA RIVER BETWEEN WAVERLY, NEW YORK AND SUNBURY, PENNSYLVANIA
Donald L. Bringham Jun. 1979 38 p refs Prepared in cooperation with Susquehanna River Basin Commission, Harrisburg, Pa.
(PB-301392/7; USGS/WRI-79/52; USGS/WRD/WRI-79/067)
Avail: NTIS HC A03/MF A01 CSCL 08H

Six flow-routing models were developed, calibrated, and verified for the Susquehanna river between Waverly, New York, and Sunbury, Pennyslvania. The models were used to simulate a 32 year record of daily flows at two ungaged sites. Low flow frequency curves for simulated flows were used to estimate 7 day low flows at the 10 year recurrence interval. The mopel errors, differences between model results and observed streamflow at gaged sites, are considered to be within reasonable limits and overall quality of simulated streamflow and low flow frquency curves is considered good. GRA

FLOW ROUTING IN THE SUSQUEHANNA RIVER BASIN. PART 3: ROUTING RESERVOIR RELEASES IN THE TIOGA AND CHEMUNG RIVERS SYSTEM, PENNSYLVANIA AND NEW YORK Final Report
Jeffrey T. Armbruster Jul. 1979 42 p refs Prepared jointly with Susquehanna River Basin Commission, Harrisburg, Pa.
(PB-301393/5; USGS/WRI-79/85; USGS/WRD/WRI-79/068)
Avail: NTIS HC A03/MF A01 CSCL 08H

Channel-routing models were used to route hypothetical releases from reservoirs in the upper Tioga River basin, Pennsylvania. The models used to route the flows of Cohocton and Chemung Rivers accounted for bank-storage discharge and streamflow depletion by well pumpage. Three hypothetical reservoirs releases were made from the reservoirs and routed to Wilkes-Barre, Pennsylvania. The first hypothetical release investigated was a constant 100 cubic feet per second, and the second release was a constant 70 cubic feet per second. The third scheme was a hypothetical release of 100 cubic feet per second for three days followed by a constant 70 cubic feet per second for the duration of the period considered. The third release scheme was generally the most efficient of the three schemes tested. GRA

IRRIGATION PRACTICES AND RETURN FLOW SALINITY IN GRAND VALLEY Final Report
Gaylord V. Skogerboe, David McWhorter, and James E. Ayars Aug. 1979 220 p refs
(Grant EPA-S-800687)
(PB80-103609; EPA-600/2-79-148) Avail: NTIS HC A10/MF A01 CSCL 02C

The relationships between leachate volume and chemical quality were evaluated. A numerical model of soil moisture and salt transport was used. Field data were collected on 63 research plots located in the Grand Valley, Colorado. From the calibration of the moisture flow model using infiltration data, water content profiles and storage change data, it was concluded that soil moisture flow could be adequately modeled for the Grand Valley. From comparisons of field and simulated data used in evaluating the soil chemistry model, it was concluded that total dissolved solids (TDS) concentrations were adequately modeled but that individual ionic species concentrations were not. The TDS profile calculated at the beginning and end of the growing season show

the salt concentration in the profile below the root zone to be relatively constant. GRA

TOWARD CLASSIFICATION AND RATIONALE FOR WATERSHED MANAGEMENT AND STREAM PROTECTION Final Report
Charles E. Warren. Jun. 1979. 148 p. refs.
(Grant EPA-R-805423)
(PB80-103153; EPA-600/3-79-059) Avail: NTIS HC A07/MF A01 CSCL 08H

A rationale for developing a classification system for watershed management is given. A hierarchical classification is developed that is based on the potentials and environments of systems, especially on the capacities of watersheds and streams to remain in desirable states over relatively long times and to return to desirable states over relatively short times. The suggested approach is to classify headwater streams by using extant knowledge of biogeoclimatic regions, watershed environments, stream order, and the morphological capacities of stream beds. GRA

HYDROLOGIC DATA ON CHANNEL ADJUSTMENTS, 1970 TO 1975, ON THE RIO GRANDE DOWNSTREAM FROM COCHITI DAM, NEW MEXICO, BEFORE AND AFTER CLOSURE Final Report
J. D. Dewey, F. E. Roybal, and D. E. Funderburg. May 1979. 542 p. refs.
(PB-301134/3; USGS/WRD/WRI-79/065; USGS/WRI-79/70) Avail: NTIS HC A23/MF A01 CSCL 13B

Cross section channel profiles sediment transport, and hydrologic data were observed and computed for a series of pre-dam post-dam investigations from 1970 to 1975 at 37 cross sections established along a 59 mile (95 kilometer) study reach

from Cochiti Dam to Isleta Diversion Dam, New Mexico. Cochiti Dam began impounding water in November 1973. Because the dam will trap virtually all of the sediment load originating upstream and water discharge will be controlled, it is expected that equilibrium values of channel width, depth, slope and sediment-transport capability in the existing main stem of the Rio Grande will change. Changes in cross sections with time and space and changes in size distribution of sediments are documented. GRA

(Grant NSF ATM-77-23757)
(PB80-104649; NCAR/TN-142) Avail: NTIS HC A04/MF A01 CSCL 20D

Numerical solutions are presented for steady flow in a zonal channel subjected to a meridionally varying zonal wind stress at the upper surface. The model used is adiabatic, hydrostatic, quasigeostrophic, and baroclinic with quadratic drag force at the lower boundary, vertical momentum diffusion in the interior, and a weak scale-selective horizontal momentum diffusion law. The solution technique is that of quasilinearization for the resulting nonlinear, two point boundary value problem. The steady solutions are also analyzed for their linearized stability to perturbations; they are found to be unstable for sufficiently strong wind stress and weak vertical momentum diffusion. GRA

REGIONAL STOCHASTIC GENERATION OF STREAMFLOWS USING AN ARIMA (1,0,1) PROCESS AND DISAGGREGATION Final Report
Jeffrey T. Armbruster May 1979 63 p refs Prepared in cooperation with Susquehanna River Basin Commission, Harrisburg, Pa.
(PB-300945/3; USGS/WRD/WRI-79/058; USGS/WRI-79/3) Avail: NTIS HC A04/MF A01 CSCL 08H

An ARIMA (1,0,1) model was calibrated and used to generate long annual flow sequences at three sites in the Juniata River basin, Pennsylvania. The model preserves the mean, variance, and cross correlations of the observed station data. In addition, it has a desirable blend of both high and low frequency characteristics and therefore is capable of preserving the Hurst coefficient, h. The generated annual flows are disaggregated into monthly sequences using a modification of the Valencia-Schaake model. One hundred year sequences were generated and analyzed for their low flow characteristics. A method is proposed for synthesizing flows at ungaged sites. GRA

DETERMINATION OF HYDROLOGIC PARAMETERS FOR GLACIAL TILLS IN CONNECTICUT M.S. Thesis
Lynn Joseph Torak 1979 172 p refs
(Contract DI-14-34-0001-9007)
(PB-300313/4; W79-09677; OWRT-A-077-CONN(1)) Avail: NTIS HC A08/MF A01 CSCL 08H

Glacial tills located in the upland areas of the Shetucket and Quinebaug River basins, Connecticut, were evaluated for horizontal permeability using field and laboratory techniques. Laboratory determined vertical permeabilities were compared to horizontal permeabilities derived from both laboratory and dugwell tests. Results indicate that the till exhibits anisotrophic flow characteristics similar to most stratified sediments. Horizontal components of permeability of at least an order of magnitude greater than vertical components are shown to exist for the glacial tills in this area. The hydrologic implications that arise from considering the anisotropy of the tills in this study area may have regional applications to similar tills located throughout New England. GRA

A MATHEMATICAL MODEL OF STRATIFIED, BIDIRECTIONAL FLOW IN SHORT CULVERTS M.S. Thesis
Delbert G. Martin 1979 89 p refs
(Contract DI-14-34-0001-7191)
(PB-300494/2; W79-09835; OWRT-B-139-UTAH(5)) Avail: NTIS HC A05/MF A01 CSCL 08H

A two dimensional computer model, simulating bidirectional, density-stratified gravity flow in the vertical plane was developed. The finite element method was applied to the governing equations, i.e., the equations of motion, continuity and convection-diffusion, to obtain a well-posed boundary value problem. Bidirectional flow is known to exist in the culverts located in the railroad causeway of the Great Salt Lake. The discharges, densities, temperatures, interface location, and head differences across the causeway were measured on a monthly basis, from October 1968 to September 1972. This data was used to verify the mathematical model. GRA

HEURISTIC DECISION RULES FOR WATER RESOURCES PLANNING
V. Akileswaran, Thomas L. Morin, and Wilbur L. Meier, Jr. Aug. 1979 274 p refs
(Contract DI-14-34-0001-7118)
(PB-300578/2; TR-119; W79-09962; OWRT-B-086-Indi(1)) Avail: NTIS HC A12/MF A01 CSCL 08H

Many of the analytical techniques proposed for water resources planning are simply too sophisticated to be of practical use. Thus, there exists a huge gap between the 'seat-of-the-pants' or ad hoc procedures which are currently in use and the more sophisticated techniques which are not. This situation is a result of a number of factors which are addressed. It is shown how this gap can be successfully filled in many situations through the use of heuristic solution procedures. The heuristics are so simple to apply that they have been successfully implemented on programmable hand-held calculators. GRA

N80-16436/ Utah Water Research Lab., Logan.
A MATHEMATICAL HYDRODYNAMIC CIRCULATION MODEL OF GREAT SALT LAKE FOR RESOURCE MANAGEMENT Final Report
Gary Z. Watters and Charles T. Kincaid Jun. 1979 82 p refs
(Contract DI-14-34-0001-7191)
(PB-299013/3; W79-09054; OWRT-B-139-Utah(6)) Avail: NTIS HC A05/MF A01 CSCL 08H

A hydrodynamic circulation model for Great Salt Lake was developed along with several supporting mathematical models required to provide information on boundary conditions and mixing processes. Two of the supporting models were developed to describe bidirectional seepage flow and culvert flow through the railroad causeway which divides the lake into a north and south arm. A third model utilizes the velocity field computed by the circulation model and provides information on convective and dispersive processes in the lake. A laboratory study was directed toward establishing the diffuse transfer of material from the lower layer of the south arm to the upper layer. GRA

EFFECTS OF URBANIZATION ON THE MAGNITUDE AND FREQUENCY OF FLOODS IN NORTHEASTERN ILLINOIS Final Water-Data Report
Howard E. Allen, Jr. and Richard M. Bejcek May 1979 58 p refs Prepared in cooperation with Illinois State Dept. of Transportation, Chicago
(PB-299065/3; USGS/WRD/WRI-79/031) Avail: NTIS HC A04/MF A01 CSCL 08H

Changes in land use associated with urbanization increased flood-peak discharges in northeastern Illinois by factors ranging up to 3.2. Techniques are presented for estimating the magnitude and frequency of floods in that area and for estimating probable changes in flood characteristics that may be expected to accompany progressive urbanization. Three variables, drainage area, channel slope, and percent imperviousness (an urbanization factor), are used to estimate flood magnitudes for frequencies ranging from 2 to 500 years. Multiple-regression analyses were used to relate flood-discharge data to the above watershed characteristics for 103 gaged watersheds. These watersheds ranged in drainage area from 0.07 to 630 square miles, in channel slope from 1.1 to 115 feet per mile, and in imperviousness from 1 to 39 percent. GRA

AQUIFER MODELING BY NUMERICAL METHODS APPLIED TO AN ARIZONA GROUNDWATER BASIN
Graham E. Fogg, Eugene S. Simpson, and Shlomo P. Neuman Jun. 1979 152 p refs
(Contract DI-14-34-0001-6235)
(PB-298962/2; TR-32; W79-09052; OWRT-C-7517(6235)(1)) Avail: NTIS HC A08/MF A01 CSCL 08H

A mixed explicit-implicit finite element program, called FLUMP was calibrated against a data base obtained from a portion of the Tucson Basin aquifer, Arizona. Previous models for the same region were constructed (an electric analog and a finite difference model) in which calibration was based on prescribed flux boundary conditions along stream courses and mountain fronts. These fluxes are not directly measured and estimates are subject to large uncertainties. In contrast, boundary conditions used in the calibration of FLUMP were prescribed hydraulic heads obtained from direct measurement. GRA

SOLAR ALTITUDE EFFECTS ON ICE ALBEDO
S. J. Bolsenga Jun. 1979 52 p refs
(PB-301252/3; NOAA-TM-ERL-GLERL-25; GLERL-Contrib-149; NOAA-79081605) Avail: NTIS HC A04/MF A01 CSCL 08L

The albedos of many natural surfaces, such as soils and crops, are known to be affected by solar altitude, but similar processes have not been well documented for ice surfaces. A limited set of ice albedo data shows that the effects of solar altitude are not nearly as pronounced as those attributed to many other natural surfaces. Surface geometry, direct-diffuse radiation balance, and spectral balance all contribute to these differences. GRA

STRIP COAL MINING AND MINED-LAND RECLAMATION IN THE HYDROLOGIC SYSTEM, SOUTHEASTERN MONTANA
Wayne A. VanVoast, Robert B. Hedges, and John J. McDermott Dec. 1978 129 p refs Prepared in cooperation with Montana Coll. of Mineral Science and Technology, Butte
(Contract OWRC-10570165)
(PB-301253/1; OWRC-70) Avail: NTIS HC A07/MF A01 CSCL 08I

Coal beds which are locally important aquifers for southeastern Montana's agricultural economy are being removed as mining development occurs. Overburden rock materials (spoils) replace the coal beds as aquifers. As mine pits are backfilled, ground waters readily reenter the spoils. The chemistry of spoils waters is diverse, reflecting the lithologic and geochemical variability of overburden materials. At Decker, predominent ions in spoils water

are sodium and bicarbonate; at Colstrip, they are magnesium, calcium, and sulfate. Statistically, spoils waters in both areas are more highly mineralized than nearby stock and domestic waters. Column backing experiments conducted with spoils produced leachates that were chemically similar to waters found in the field. First pore volumes of the leachate were also chemically similar to saturated-paste extracts. The relationships between saturated-paste-extracts quality and spoils-water quality were utilized to develop generalized nomographs for predicting spoils-water cation concentrations from pre-mining paste-extract chemistry. Similar attempts toward predictive nomographs utilizing specific conductance were unsuccessful. GRA

SIDEBOARD DEVICE FOR IMPROVED FACE VENTILATION IN COAL MINES Technical Progress Report, period ending Aug. 1979
Edward F. Drivers, John C. LaScola, and Fred N. Kissel Aug. 1979 15 p
(PB-300365/4; BM-TPR-108) Avail: NTIS HC A02/MF A01 CSCL 08I

A sideboard device designed to act as an extension of conventional brattice, thus improving face ventilation of developing room and pillar type coal mining was tested. In these laboratory tests, an 8 foot long rigid sideboard was mounted vertically along the left fender of a full scale model ripper-type continuous mining machine, rising to the mine roof to provide an air seal. It extended from the auger support frame pivot point outby along the fender. A novel water spray manifold was used to form an air seal between the sideboard and brattice. Tests showed improvement in face ventilation with the prototype device, and also demonstrated that water sprays can form an effective air seal over a fairly wide pressure range. GRA

RADIANT HEATING OF MINE BULKHEADS
John C. Edwards 1979 22 p refs
(PB-300363/9; BM-RI-8356) Avail: NTIS HC A02/MF A01 CSCL 08I

A time dependent mathematical model of radiative heating of bulkheads in mines was developed. The model includes both reradiation from the duct (cylindrical) walls and direct radiation from the fire zone. Thermal loss into the wall of the duct and into the bulkhead is included. Both brick and wood bulkheads are considered. It was found that the heating rate of the system scales as the duct length-to-diameter ratio and the flame temperature. In particular, the time required for the irradiated surface of the bulkhead to reach a specified temperature decreases with increasing flame temperature for a fixed length-to-diameter ratio and increases with increasing length-to-diameter ratio for a specified flame temperature. GRA

IMPROVED LIGHT SCATTERING DUST MONITOR Final Report, 3 Aug. 1977 - 31 May 1978
Pedro Liberfeld 28 Feb. 1979 48 p refs
(Contract DI-BM-HO-377092)
(PB-299938/1; BM-OFR-90-79) Avail: NTIS HC A03/MF A01 CSCL 08I

The development, design, fabrication, and testing of a portable, battery-operated, light scattering monitor for the rapid measurement of the concentration of respirable dust in mining environments are described. This instrument incorporates state-of-the-art design characteristics and makes use of advanced solid-state components both for light emission as well as for its detection. The use of a pulsed light source combined with synchronous signal detection minimizes drift problems and optimizes the sensitivity of the measurement. Equivalent mass concentration measurements as low as 10 micrograms per cubic meter can be routinely performed with time constants of about 2 seconds. GRA

A TECHNIQUE FOR ESTIMATING HEIGHTS REACHED BY THE 100-YEAR FLOOD ON UNREGULATED, NONTIDAL STREAMS IN NORTH CAROLINA Final Report, 1978 - 1979
R. W. Coble Jul. 1979 21 p refs
(PB-301372/9; USGS/WRI-79/69) Avail: NTIS HC A02/MF A01 CSCL 08H

A method for estimating heights reached by floods having a recurrence interval of 100 years is defined for nontidal streams with unregulated flows in North Carolina. The flood heights are the vertical distance between stream stage at median discharge (50 percent duration) and the 100-year flood stage and are defined for streams draining areas between 1 and 10,000 square miles. A flood height drainage area relation was determined by regression analysis for each of the three physiographic areas of the State-mountains, piedmont, and coastal plain. An illustrated example of how the method can be used in conjunction with topographic maps to estimate flood heights and delineate inundated areas by interpolation is given. GRA

HYDROLOGIC DATA FROM URBAN WATERSHEDS IN THE TAMPA BAY REGION
M. A. Lopez and D. M. Michaelis Aug. 1979 60 p
(PB-301204/4; USGS/WRI-78/125;
USGS/WRD/WRI-79/066) Avail: NTIS HC A04/MF A01 CSCL 08H

Hydrologic data were collected in 10 urbanized watersheds located in the Tampa Bay area, Florida. The gaged watersheds have impervious areas that range from 19 percent for a residential watershed in north Tampa to nearly 100 percent for a downtown Tampa watershed. Land use type, including roads, residential, commercial, industrial, institutional, recreational, and open space, were determined for each watershed. Rainfall and storm runoff data collected were processed. These data were recorded at 5 minute intervals. Chemical and biological analyses of storm runoff for six sites, base flow for seven sites, and analyses of bottom material for seven sites were also stored in the WATSTORE water quality file. GRA

APPLICATION OF TRANSIENT-FLOW TO THE SACRAMENTO RIVER AT SACRAMENTO, CALIFORNIA Final Report
Richard N. Oltmann Feb. 1979 29 p refs Prepared in cooperation with California State Dept. of Water Resources, Sacramento
(PB-301103/8; USGS/WRD/WRI-79/063;
USGS/WRI-78/119) Avail: NTIS HC A03/MF A01 CSCL 08H

The transient-flow simulation model was applied to the Sacramento River at Sacramento, California. An alternative is needed to the empirical stage-fall-discharge computational method, which provides only daily mean discharges and required frequent measurement over a 25- to 26-hour period of the tide-affected flow. Measurement of tide-affect flow involves use of a cable suspended across the river; this presents a hazardous navigational condition. Use of the model does not eliminate the hazardous navigational problem, but it significantly reduces the time that this condition exists. The model demonstrates that it can provide reliable daily mean as well as instantaneous discharge

data. The model also has the capability of providing discharge data for locations farther downstream in the tidal zone from the Sacramento stream gage; this is not possible with the stage-fall-discharge computational method. GRA

THE INTERFACE STATE EFFECTS AND CHARACTERIZATION OF MIS SOLAR CELLS Ph.D. Thesis
Jimm Koo Kim 1979 201 p
Avail: Univ. Microfilms Order No. 7928412

Sets of samples were prepared and experiments were performed on MIS diodes to investigate the interface state density distributions across the semiconductor band gap, using various substrates and metals. The current flow mechanisms in tunneling MIS solar cells were studied. A computer algorithm, generated to simulate the photovoltaic action of MIS solar cells based on the theory developed is described. Experimental data such as the interface state density spectra, time constants, absorption cross sections, and oxide capacitance used in generating I-V plots in dark and under light conditions are discussed. The boundary value problem solved by the computer iterative method using Shickley's assumption of constant quasi Fermi level throughout the depletion region, is described. Dissert. Abstr.

Avail: NTIS. HC A20/MF A01. CSCL 10B

Approaches to the structural analysis of wind turbine blade designs are reviewed. Specifications and materials data are discussed along with the analysis of vibrations, loads, stresses, and failure modes. K.L.

N80-16470*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
BLADE DESIGN AND OPERATING EXPERIENCE ON THE MOD-OA 200 kW WIND TURBINE AT CLAYTON, NEW MEXICO
Bradford S. Linscott and Richard K. Shaltens. *In its* Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 225-238. refs (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

Two 60 foot long aluminum wind turbine blades were operated for over 3000 hours on the MOD-OA wind turbine. The first signs of blade structural damage were observed after 400 hours of operation. Details of the blade design, loads, cost, structural damage, and repair are discussed. K.L.

N80-16471*# Lockheed Aircraft Service, Inc., Ontario, Calif.
EVALUATION OF AN OPERATING MOD-OA 200 kW WIND TURBINE BLADE
Robert E. Donham. *In* NASA. Lewis Res. Center. Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 239-265. refs (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

Operating loads and structural damage were monitored during operation of the MOD-OA electric generating system. The turbine was damaged locally between stations 48 and 125 after 2.8 million rotations. Loads due to degraded yaw stiffness and fretting at rib station 48 were identified as primary to this distress. The repaired blades operated an additional 4.8 million rotations without problems. K.L.

N80-16472*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
DESIGN, FABRICATION, AND TEST OF A STEEL SPAR WIND TURBINE BLADE
Timothy L. Sullivan, Paul J. Sirocky, Jr., and Larry A. Viterna. *In its* Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 267-284. refs (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

The design and fabrication of wind turbine blades based on 60 foot steel spars are discussed. Performance and blade load information is given and compared to analytical prediction. In addition, performance is compared to that of the original MOD-O aluminum blades. Costs for building the two blades are given, and a projection is made for the cost in mass production. Design improvements to reduce weight and improve fatigue life are suggested. K.L.

N80-16473*# WTG Energy Systems, Inc., Buffalo, N.Y.
WTG ENERGY SYSTEMS' ROTOR: STEEL AT 80 FEET
Robert E. Barrows. *In* NASA. Lewis Res. Center. Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 285-292 (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

The design, specifications, and performance of the 80 foot diameter fixed pitch rotor operating on the MP1-200 wind turbine generator installed as part of the Island of Cuttyhunk's electric power utility grid system are described. This synchronous generating system rated 200 kilowatts at 28 mph wind velocity, and produces constant 60 Hz, 480 VAC current at +/- 1 percent accuracy throughout the machine's operating range. Future R & D requirements and suggestions are included with cost data. A.R.H.

THE USE OF WOOD FOR WIND TURBINE BLADE CONSTRUCTION
Meade Gougeon and Mike Zuteck. *In* NASA. Lewis Res. Center. Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 293-308 (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

The interrelationships between moisture and wood, conditions for dry rot spore activity, the protection of wood fibers from moisture, wood resin composites, wood laminating, quality control, and the mechanical properties of wood are discussed. The laminated veneer and the bonded sawn stock fabrication techniques, used in the construction of a turbine blade with a monocoque 'D' section forming the leading edge and a built up trailing edge section, are described. A 20 foot root end sample complete with 24 bonded-in studs was successfully subjected to large onetime loads in both the flatwise and edgewise directions, and to fatigue tests. Results indicate that wood is both a viable and advantageous material for use in wind turbine blades. The basic material is reasonably priced, domestically available, ecologically sound, and easily fabricated with low energy consumption. A.R.H.

LARGE, LOW COST COMPOSITE WIND TURBINE BLADES
Herbert W. Gewehr. *In* NASA. Lewis Res. Center. Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 309-324. refs (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

A woven roving E-glass tape, having all of its structural fibers oriented across the tape width was used in the manufacture of the spar for a wind turbine blade. Tests of a 150 ft composite blade show that the transverse filament tape is capable of meeting structural design requirements for wind turbine blades. Composite blades can be designed for interchangeability with steel blades in the MOD-1 wind generator system. The design, analysis, fabrication, and testing of the 150 ft blade are discussed. A.R.H.

THE MOD-1 STEEL BLADE
John VanBronkhorst. *In* NASA. Lewis Res. Center. Large Wind Turbine Design Characteristics and R and D Requirements. Dec. 1979. p 325-342 (For primary document see N80-16453 07-44)
Avail: NTIS. HC A20/MF A01. CSCL 10B

The design, development, fabrication, testing, and transport of two 100 foot metal blades for the MOD-1 WTS are summarized. Because the metal blade design was started late in the MOD-1 system development, many of the design requirements (allocations) were restrictive for the metal blade concept, particularly the maximum weight requirement. The design solutions required to achieve the weight goal resulted in a labor intensive (expensive) fabrication, particularly for a quantity of only two blades manufactured using minimal tooling. A.R.H.

SYSTEM CONFIGURATION IMPROVEMENT
Glidden S. Doman *In* NASA. Lewis Res. Center Large Wind Turbine Design Characteristics and R and D Requirements Dec. 1979 p 385-396 (For primary document see N80-16453 07-44)
Avail: NTIS HC A20/MF A01 CSCL 10B

Factors involved in the choice of the system configuration for the wind turbine generator are listed. It was found that choices among the many configuration options can be based strictly upon the resulting cost of energy results. Choices made on that basis also lead to reduced analytical complexity, less hardware complexity and reduced program risk. It was also found that many seemingly minor details turn out to have important impacts that are seen only after design, performance and cost-finding were thoroughly probed. M.M.M.

N80-16482*# Hamilton Standard, Windsor Locks, Conn.
COST OF ENERGY EVALUATION
Thad M. Hasbrouck *In* NASA. Lewis Res. Center Large Wind Turbine Design Characteristics and R and D Requirements Dec. 1979 p 397-402 (For primary document see N80-16453 07-44)
Avail: NTIS HC A20/MF A01 CSCL 10B

The estimated cost per kilowatt hour, the wind resources in the utilities service area, and the reliability of the units are considered in computing the cost of energy of the wind turbine generator system. M.M.M.

STUDY OF ADVANCED RADIAL OUTFLOW TURBINE FOR SOLAR STEAM RANKINE ENGINES
Cecil Martin and Terry Kolenc Dec. 1979 74 p refs
(Contract DEN3-86)
(NASA-CR-159695; DOE/NASA/0086-79/1; ETI-1279) Avail: NTIS HC A04/MF A01 CSCL 10B

The performance characteristics of various steam Rankine engine configurations for solar electric power generation were investigated. A radial outflow steam turbine was investigated to determine: (1) a method for predicting performance from experimental data; (2) the flexibility of a single design with regard to power output and pressure ratio; and (3) the effect of varying the number of turbine stages. All turbine designs were restricted to be compatible with commercially available gearboxes and generators. A study of several operating methods and control schemes for the steam Rankine engine shows that from an efficiency and control simplicity standpoint, the best approach is to hold turbine inlet temperature constant, vary turbine inlet pressure to match load, and allow condenser temperature to float maintaining constant heat rejection load. A.R.H.

SATELLITE POWER SYSTEM (SPS)
Henry G. Edler Oct. 1978 20 p refs
(Contract EG-77-C-02-4042)
(NASA-TM-80943; TID-29094) Avail: NTIS HC A02/MF A01 CSCL 10A

Potential organizational options for a solar power satellite system (SPS) were investigated. Selection and evaluation criteria were determined to include timeliness, reliability, and adequacy to contribute meaningfully to the U.S. supply; political feasibility (both national and international); and cost effectiveness (including environmental and other external costs). Based on these criteria, four organizational alternatives appeared to offer reasonable promise as potential options for SPS. A large number of key issues emerged as being factors which would influence the final selection process. Among these issues were a variety having to do with international law, international institutions, environmental controls, economics, operational flexibility, congressional policies, commercial-vs-governmental ownership, national dedication, and national and operational stategic issues. R.E.S.

EVALUATION OF CONCENTRATED SPACE SOLAR ARRAYS USING COMPUTER MODELING
D. E. Rockey 1 Nov. 1979 54 p refs

(Contract NAS7-100)
(NASA-CR-162681; JPL-PUB-79-87) Avail: NTIS HC A04/MF A01 CSCL 10A

A general approach is developed for predicting the power output of a concentrator enhanced photovoltaic space array. A ray trace routine determines the concentrator intensity arriving at each solar cell. An iterative calculation determines the cell's operating temperature since cell temperature and cell efficiency are functions of one another. The end result of the iterative calculation is that the individual cell's power output is determined as a function of temperature and intensity. Circuit output is predicted by combining the individual cell outputs using the single diode model of a solar cell. Concentrated array characteristics such as uniformity of intensity and operating temperature at various points across the array are examined using computer modeling techniques. An illustrative example is given showing how the output of an array can be enhanced using solar concentration techniques. Author

DIFFUSION LENGTH MEASUREMENTS OF THIN GaAs SOLAR CELLS BY MEANS OF ENERGETIC ELECTRONS
Oldwig vonRoss 1 Feb. 1980 17 p refs
(Contract NAS7-100)
(NASA-CR-162692; JPL-PUB-79-121) Avail: NTIS HC A02/MF A01 CSCL 10A

A calculation of the short circuit current density (j sub sc) of a thin GaAs solar cell induced by fast electrons is presented. It is shown that in spite of the disparity in thickness between the N-type portion of the junction and the P-type portion of the junction, the measurement of the bulk diffusion length L sub p of the N-type part of the junction is seriously hampered due to the presence of a sizable contribution to the j sub sc from the P-type region of the junction. Corrections of up to 50% had to be made in order to interpret the data correctly. Since these corrections were not amenable to direct measurements it is concluded that the electron beam method for the determination of the bulk minority carrier diffusion length, which works so well for Si solar cells, is a poor method when applied to thin GaAs cells. R.E.S.

A 15kWe (NOMINAL) SOLAR THERMAL ELECTRIC POWER CONVERSION CONCEPT DEFINITION STUDY: STEAM RANKINE REHEAT RECIPROCATOR SYSTEM Final Report
H. Fuller, R. Demler, E. Poulin, and P. Dantowitz Jun. 1979 63 p refs
(Contracts DEN3-62; EX-76-A-29-1060)
(NASA-CR-159590; DOE/NASA/0062-79/1; NAS-7845) Avail: NTIS HC A04/MF A01 CSCL 10B

An evaluation was made of the potential of a steam Rankine reheat reciprocator engine to operate at high efficiency in a point-focusing distributed receiver solar thermal-electric power system. The scope of the study included the engine system and electric generator; not included was the solar collector/mirror or the steam generator/receiver. A parametric analysis of steam conditions was completed leading to the selection of 973 K 12.1 MPa as the steam temperature/pressure for a conceptual design. A conceptual design was completed for a two cylinder/opposed engine operating at 1800 rpm directly coupled to a commercially available induction generator. A unique part of the expander design is the use of carbon/graphite piston rings to eliminate the need for using oil as an upper cylinder lubricant. The evaluation included a system weight estimate of 230 kg at the mirror focal point with the condenser mounted separately on the ground. The estimated cost of the overall system is $1932 or $90/kW for the maximum 26 kW output. R.E.S.

PRELIMINARY ANALYSIS OF PERFORMANCE AND LOADS DATA FROM THE 2-MEGAWATT MOD-1 WIND TURBINE GENERATOR
D. A. Spera, L. A. Viterna, T. R. Richards, and H. E. Neustadter 1979 16 p refs Presented at 4th Biennial Conf. and Workshop on Wind Energy Conversion Systems, Washington, D.C., 29-31 Oct. 1979; sponsored by DOE
(Contract EX-77-A-29-1010)
(NASA-TM-81408; DOE/NASA/1010-79/5; E-322) Avail: NTIS HC A02/MF A01 CSCL 10A

Preliminary test data on output power versus wind speed, rotor blade loads, system dynamic behavior, and start-stop characteristics on the Mod-1 wind turbine generator are presented.

These data were analyzed statistically and are compared with design predictions of system performance and loads. To date, the Mod-1 wind turbine generator has produced up to 1.5 MW of power, with a measured power versus wind speed curve which agrees closely with design. Blade loads were measured at wind speeds up to 14 m/s and also during rapid shutdowns. Peak transient loads during the most severe shutdowns are less than the design limit loads. On the inboard blade sections, fatigue loads are approximately equal to the design cyclic loads. On the outboard blade sections, however, measured cyclic loads are significantly larger than design values, but they do not appear to exceed fatigue allowable loads as yet. R.E.S.

SEMICONDUCTOR GRADE, SOLAR SILICON PURIFICATION PROJECT Final Report
W. M. Ingle, R. R. Rosler, S. W. Thompson, and R. E. Chaney 10 Dec. 1979 173 p
(Contract JPL-954442)
(NASA-CR-162746; DOE/JPL-954442-78/12; Motorola-2257/12) Avail: NTIS HC A08/MF A01 CSCL 10A

Experimental apparatus and procedures used in the development of a 3-step SiF2(x) polymer transport purification process are described. Both S.S.M.S. and E.S. analysis demonstrated that major purification had occured and some samples were indistinguishable from semiconductor grade silicon (except possibly for phosphorus). Recent electrical analysis via crystal growth reveals that the product contains compensated phosphorus and boron. The low projected product cost and short energy payback time suggest that the economics of this process will result in a cost less than the goal of $10/Kg(1975 dollars). The process appears to be readily scalable to a major silicon purification facility. A.R.H.

ENVIRONMENTAL DEVELOPMENT PLAN: SOLAR THERMAL POWER SYSTEMS
Aug. 1979 45 p refs
(DOE/EDP-0035) Avail: NTIS HC A03/MF A01

The goals of the program and potential environmental, health, safety, and socioeconomic impacts relevant to solar thermal power systems (STPS), particularly those sited in the Southwest are discussed. These impacts are screened for key issues, i.e., those issues considered to be the most serious in nature, that have near-term importance to the program, and for which current knowledge of effects and control is inadequate. A management plan is then presented for conducting and coordinating environmental research in concert with the technology development effort to ensure that identified environmental issues are resolved prior to significant public deployment of the technology. Key environmental concerns associated with the development and deployment of STPS were identified in the following subject areas: (1) site selection (including the question of water availability); (2) ecological and microclimatic effects; (3) working fluid handling and release modes; and (4) misdirected solar radiation. COMPUTER SIMULATION OF GROUND COUPLED STORAGE IN A SERIES SOLAR ASSISTED HEAT PUMP SYSTEM
J. W. Andrews and Philip D. Metz 1979 5 p refs Presented at the 1979 Intern. Solar Energy Soc. Congr., Atlanta, 28 May - 1 Jun. 1979
(Contract EY-76-C-02-0016)
(BNL-26216; CONF-790541-25) Avail: NTIS HC A02/MF A01

The effect of thermal coupling between the ground and the heat storage element of a series solar assisted heat pump system is studied quantitatively. The transient simulation computer program TRNSYS is used to simulate the solar portion of this system. A program to simulate the thermal interaction of the storage element with the ground is incorporated into TRNSYS as a subroutine. This program calculates heat flow through the ground in discrete steps over space and time. Boundary conditions are established. The ground coupled storage is driven by thermal inputs from the solar portion of the system and from the changing ambient and ground temperatures. DOE

FIXED MIRROR SOLAR CONCENTRATOR FOR APPLICATION TO A 100 MW(e) ELECTRIC GENERATING PLANT
J. R. Schuster, J. M. Neill, and J. Bass May 1979 6 p refs Presented at the 14th Intersoc. Energy Conf., Boston, 5-10 Aug. 1979
(Contract ET-78-C-03-2240)
(GA-A-15340; CONF-790803-10) Avail: NTIS HC A02/MF A01

A design study was performed of a 100 MW(e) power plant that uses a fixed mirror solar concentrator (FMSC) to supply energy for steam generation. Various heat transport fluids were considered and draw salt was selected over Therminol 88 and sodium. The complete plant was modeled in a cost performance optimization code which automatically performed tradeoffs such as reduced blocking vs increased piping costs, field piping heat loss vs pumping power, and fluid outlet temperature vs overall system efficiency. Various collector and receiver designs were studied and evaluated for their cost effectiveness. Operational requirements impacting the component designs were identified. DOE

COMPARATIVE ANALYSIS OF SOLAR ENERGY STORAGE CYCLES
C. E. Hackett 1979 25 p refs Presented at the Intern. Conf. on Solar Energy, Milan, 23 Sep. 1979
(SAND-79-1803C; CONF-790954-1) Avail: NTIS HC A02/MF A01

A thermodynamic technique is presented which will enable the assessment of the overall performance of various storage options on an absolute basis so that cost effective designs can be developed to obtain the full thermodynamic and system advantages of energy storage. First the underlying thermodynamic principles of entropy production analysis are examined. The various energy storage schemes are classified. Detailed analyses were developed to cover the various generic types of energy storage which are appropriate for solar power systems. DOE

N80-16517# Sandia Labs., Albuquerque, N. Mex.
PREPARATION OF THIN FILMS FOR SOLAR ENERGY UTILIZATION
D. M. Mattox 1979 17 p refs Presented at the National Vacuum Symp., New York, N.Y., 2 Oct. 1979
(Contract EY-76-C-04-0789)
(SAND-79-1754C; CONF-791013-2) Avail: NTIS HC A02/MF A01

A technology assessment of thin film deposition techniques is presented. Commercial applications of thin films include photothermal selective absorbers formed by electroplating, chemical conversion and vacuum processing; solar reflectors formed by vacuum processes; heat reflectors formed by vacuum processes and spray pyrolysis; antireflection coatings formed by vacuum processes and chemical leaching and the metallization of photovoltaic cells. CdS/Cu2S photovoltaics formed by vacuum processes and spray pyrolysis are also close to commercial utilization. Principle concerns in thin films applications include economics of fabrication and environmental stability of the thin film materials. One of the major problems with thin film evaluation is the lack of acceptable testing procedures particularly as related to lifetime. The status of thin films in solar energy utilization is reviewed. DOE

EXPERIMENTAL TEST FACILITY FOR SELECTIVE RADIATIVE COOLING SURFACES
F. Sakkal, M. Martin, and P. Berdahl Aug. 1979 6 p refs Presented at the Nat. Passive Solar Energy Conf., Kansas City, Kansas, 3 Oct. 1979
(Contract W-7405-eng-48)
(LBL-9697; CONF-791022-92) Avail: NTIS HC A02/MF A01

The newly constructed radiator test facility at Lawrence Berkeley Laboratory is described and preliminary results are presented for cooling rates from two radiating surfaces. DOE

N80-16519# Ames Lab., Iowa.
PRELIMINARY EXPERIMENTAL RESULTS ON THE OPTICAL PROPERTIES OF MODEL DIRECT SOLAR GAIN INTERIORS
J. F. McClelland, R. Fuchs, R. N. Kniseley, D. A. Block, and L. Hodges 1979 5 p refs Presented at the Nat. Passive Solar Energy Conf., Kansas City, Kansas, 3 Oct. 1979 Prepared jointly with Iowa St. Univ. of Science and Technology, Ames
(Contract W-7405-eng-82)
(ISM-233) Avail: NTIS HC A02/MF A01

An assessment is presented of conditions necessary for quantitative characterizations of direct solar gain optical properties using photoacoustic measurements. Means of satisfying the experimental requirements are discussed in detail. DOE

N80-16520# Idaho National Engineering Lab., Idaho Falls.
COMMERCIAL PROTOTYPE DESIGN OF A SOLAR HEATING/COOLING SYSTEM FOR A MANUFACTURED HOME
M. P. Scofield (EG&G Idaho, Inc., Idaho Falls), A. S. Lau (EG&G Idaho, Inc., Idaho Falls), K. H. Liebelt (EG&G Idaho, Inc., Idaho Falls), N. R. Shinn (Boise Cascade Corp., Idaho), and T. L. Schafer (Boise Cascade Corp., Idaho) Sep. 1979 140 p refs Prepared jointly with Boise Cascade Corp., Idaho
(Contract EY-76-C-07-1570)
(TREE-1384) Avail: NTIS HC A07/MF A01

A prototype design is presented for a solar heating and cooling system for a manufactured modular home. The objective was to develop an active solar system for space heating that would be competitive with conventional energy sources; that is, the increase in the mortgage payment would be completely and simultaneously recovered from energy savings. The heating and cooling system features air collectors that are structurally part of the south facing rear wall, rock storage that is in the basement, and a heat exchanger that preheats domestic hot water. Summer cooling is achieved by cooling rock storage at night and circulating house air through the storage during the day as required. Two nearly identical homes were designed and built incorporating the prototype system. Both in Idaho, one house is located in Boise, the other in Idaho Falls, placing the homes in distinctly different climates. Both homes are being monitored for a two-year period to obtain dynamics and long-term performance data. The results of the monitoring will be the subjects of further reports. DOE

OTEC PERFORMANCE TESTS OF THE UNION CARBIDE ENHANCED-TUBE CONDENSER
David T. Yung, David L. Hillis, James J. Lorenz, and Norman F. Sather May 1979 33 p refs
(Contract W-31-109-eng-38)
(ANL/OTEC-PS-2) Avail: NTIS HC A03/MF A01

Results of performance tests conducted on a Union Carbide enhanced-tube condenser with wire wrapping on the ammonia side and internal axial fins on the water side are reported. This unit performed satisfactorily and was free of operational difficulties. At design operating conditions (a heat duty of 3.2 million Btu/h, an inlet water temperature of 40 F, and a water flow rate of 3200 gpm) the steady-state value of the overall heat transfer coefficient was found to be 818 Btu/h sq + ft F, and the ammonia-side and water-side heat transfer coefficients were 5180 and 1130 Btu/h.sq ft F, respectively. The water-side pressure drop was 1.8 psi. Varying the heat duty from 2.4 million to 4.0 million Btu/h had a negligible effect on thermal performance. The value obtained for the ammonia-side-heat transfer coefficient at nominal conditions is about two times that predicted by the Nusselt expression for condensation on a smooth tube. The water-side coefficient is within 3% of the value predicted by the Noranda correlation for finned tubes. DOE

ORGANIC PHOTOCHEMICAL STORAGE OF SOLAR ENERGY Progress Report, 1 Mar. 1978 - 31 Jan. 1979
G. Jones, II Feb. 1979 24 p refs
(Contract EG-77-S-02-4380)
(COO-4380-2) Avail: NTIS HC A02/MF A01

Photosensitization mechanisms for driving energy storing reactions of readily available organic compounds were studied. Aromatic sensitizers were used as complexing agents for a series of non-conjugated dienes which are capable of valence isomerization. Diene exciplexes, shown to be stabilized by electron donor-acceptor interaction, led to photoisomers with chemical and quantum efficiency in two of the cases studied. With triplet photosensitizers visible light (to 520 nm) was used to bring about an energy storing valence isomerization of a diester derivative of norbornadiene. High quantum yields (0.6) were measured at the longest wavelengths yet utilized for this type of isomerization. The quantum efficiency for isomerization using a very low energy triplet sensitizer was significantly enhanced at slightly elevated temperatures, suggesting that thermal energy (in amounts present in solar collector media) can be an aid in driving energy storing photo-reactions. DOE

MODELING THE BEAM CHARACTERIZATION SYSTEM
F. Biggs, C. N. Vittitoe, and D. L. King 1979 20 p refs

Presented at ISA Natl. Conf., Chicago, 22 Oct. 1979
(Contract EY-76-C-04-0789)
(SAND-79-1295C; CONF-791005-4) Avail: NTIS
HC A02/MF A01

A theoretical model of the beam characterization system (BCS) to interpret results is presented. This model serves as an aid to define specifications, analyze measurements, calculate performance, and answer other questions about the heliostat. A statistical method is used to handle stochastic variables such as sun-tracking errors and surface-slope errors. A cone-optics technique is used to incorporate the statistics into a consistent model of the optical behavior of a heliostat. Use of the model to unfold slope-error distributions and sun-tracking statistics is described for measurements both in and out of the focal plane. The importance of auxiliary input information such as the sunshape (angular distribution of sun rays) to the analysis of BCS measurements is discussed. The role of the BCS in validating heliostats against acceptance criteria is summarized. DOE

(SAND-79-1532C; CONF-791005-2) Avail: NTIS
HC A02/MF A01

The beam characterization system which digitizes the output signal from a standard 525 line video camera to obtain raw data for measurements of solar heliostat images is described. Absolute irradiance values are obtained from a calibrated pyrheliometer included on the target screen. A video camera measures the relative irradiance values of areas of identical spectral composition. Measurements are made over a two dimensional spatial array of N screen locations. Calibration corrections are applied to the data from the N locations to obtain a single calibrated irradiance data matrix. Methods of obtaining these corrections are discussed and measured results are presented to support the various assumptions. DOE

SOLAR AVAILABILITY FOR WINTER SPACE HEATING: AN ANALYSIS OF THE CALENDAR PERIOD 1953-1975
J. G. Asbury, C. Maslowski, and R. O. Mueller. Apr. 1979. 20 p. refs.
(Contract W-31-109-eng-38)
(ANL/SPG-14) Avail: NTIS HC A02/MF A01

Data tapes for eight US sites containing hourly readings of insolation and ambient temperature for the period 1953-1975 were analyzed. Scatter-diagrams of insolation versus heating degree-days, compiled on a daily basis, indicate a wide variation in insolation levels, even during periods of coldest weather. For seven of the eight sites, the peak-day backup energy required by a solar space heating system exceeded 85 percent of the peak-day energy requirement of a conventional (nonsolar) heating system. The cities considered are Albuquerque (NM), Bismark (ND), Boston (MA), Caribou (ME), Columbia (MO), Madison (WI), Seattle (WA), and Sterling (VA). DOE

CARRIER TRANSPORT THROUGH HETEROJUNCTION SOLAR CELLS
K. W. Boeer. 1979. 7 p. refs. Presented at the Photovoltaic Solar Energy Conf., West Berlin, 23 Apr. 1979. Prepared jointly with SES, Inc., Newark, Del.
(Contract EX-76-C-23-1030)
(DOE/ET/23103-5; CONF-790457-8) Avail: NTIS
HC A02/MF A01

Carrier transport through heterojunctions was analyzed and found to be influenced by the interconnection between the bands of the two semiconductors, by space charge effects near this interconnection, and by interface recombination. Estimation of the discontinuity of the conduction bands using the difference in electron affinities was found insufficient. The space charge double layer caused by charged dangling bonds along the dislocation network and its compensation via charged defects is discussed. Band profile for CdS/Cu2S and Cd/sub x/Zn/sub 1-x/S/Cu2S heterojunctions were evaluated quantitatively and agree within the experimental error with the observation, that, with decreasing lattice mismatch, the open circuit voltge increases, while the short circuit current decreases. LOW-COST STRUCTURES FOR PHOTOVOLTAIC ARRAYS. Final Report
P. Masser. Aug. 1979. 204 p. refs.
(Contract EY-76-C-04-0789)
(SAND-79-7006) Avail: NTIS HC A10/MF A01

Designs of photovoltaic array support structures, which encourage life cycle cost reduction through mass production techniques, material cost reduction, and simplified installation methods, are presented. Nontracking collectors with a low concentration ratio (one to about two sums) are considered primarily for commercial and utility applications. The results are applicable to both thermal and photovoltaic flat plate collectors. A value analysis approach was used, starting with a survey of the current state-of-the-art which found an absence of pertinent references on array support structures. Also, realistic load criteria were not found, and this was determined to be a key area for future cost reduction. Heights above the ground, array geometry, and wind direction all have important effects on loads. Foundation design was also found to be a key area for future cost reduction. A generic concept study was conducted, aimed at life cycle cost reduction, and representative examples were chosen. DOE

DIRECT ENERGY CONVERSION SYSTEMS
G. H. Miley. 1978. 11 p. refs. Presented at the Meeting on the Technology of Controlled Thermonuclear Fusion, Santa Fe, N. Mex., 9 May 1978.
(Contract EY-76-S-02-2218)
(COO-2218-117; CONF-780508-73) Avail: NTIS HC A02/MF A01

The potential importance of direct energy conversion to the long-term development of fusion power is discussed with stress on the possibility of alleviating waste heat problems. Two approaches to direct conversion, i.e., direct collection and magnetic expansion are reviewed. DOE

N80-16544# Applied Physics Lab., Johns Hopkins Univ., Laurel, Md.
SPIN TEST OF THE UNIVERSITY OF CALIFORNIA, LAWRENCE LIVERMORE LABORATORY COMPOSITE FLYWHEEL AT THE APPLIED PHYSICS LABORATORY, THE JOHNS HOPKINS UNIVERSITY, ON 18 JULY 1978. Final Report
D. W. Rabenhorst and T. R. Small. 15 Sep. 1978. 15 p. ref.
(Contract W-7405-eng-48)
(UCRL-13910) Avail: NTIS HC A02/MF A01

The Livermore flywheel is a composite structure of laminated, unidirectional, carbon fiber epoxy layers arranged in a quasi-isotropic structural pattern. The flywheel was built up of 160 layers of this unidirectional material with each layer oriented so that the axis of the fibers was 45 degrees from the fibers in the preceding layers. This 45 degree progressive lay-up was arranged so that the flywheel would have mid-plane symmetry. Final cross-section shape of the flywheel was machined with carbide tools to a modified tapered form. The intent was to provide uniform stress throughout the flywheel in the spinning condition. The flywheel specifications, test facility, and spin test results are briefly discussed. DOE

WORLDWIDE TRANSPORTATION/ENERGY DEMAND FORECAST, 1975 - 2000
R. U. Ayres. Oct. 1978. 103 p. refs.
(Contract W-7405-eng-26)
(ORNL/SUB-78/13536/1) Avail: NTIS HC A06/MF A01

Worldwide transportation energy demand for both commodities and passengers are forecast for 1975 - 2000. The long-range forecast methodology is described. Regional aggregation and economic/demographic projects are discussed. Transportation projections and transportation energy projections are presented. DOE

N80-16547# Department of Energy, Washington, D. C.
ADVANCED ELECTRIC GENERATION. COMMERCIALIZATION IN PHASE 3 PLANNING
Sep. 1978. 46 p.
(DOE/ERD-0014) Avail: NTIS HC A03/MF A01

Two basic technologies are under consideration for advanced electrical generation: fluidized-bed combustion (FBC) and phosphoric acid fuel cells. FBC consists of two major subtypes: atmospheric and pressurized fluidized-bed combustion. The fuel-cell power plant produces electricity by electrochemical conversion. The commercial readiness of these technologies with respect to environmental issues was investigated. Characteristics of the technologies and status information on the technical and environmental R and D programs are discussed. A milestone chart representing a relationship between a considered commercialization schedule and relevant environmental R and D is presented. Environmental concerns significant to the technologies were reviewed. The likelihood and consequences of adverse

findings, the problems and uncertainties stemming from current or anticipated environmental regulation, and potential costs of environmental control are examined. DOE

APPLICATION ANALYSIS AND PHOTOVOLTAIC SYSTEM CONCEPTUAL DESIGN FOR SERVICE/COMMERCIAL/INSTITUTIONAL AND INDUSTRIAL SECTORS. TASK 1 REPORT
R. A. Whisnant, R. D. Alberts, R. M. Burger, R. P. Gardner, C. B. Morrison, and N. G. Staffa. Jul. 1978. 155 p. refs.
(Contract EY-76-C-04-0789)
(SAND-78-7032). Avail: NTIS. HC A08/MF A01.

The approach used to identify applications in the defined sectors for photovoltaic conversion are: (1) The Standard Industrial Classification Codes and to describe the applications that must be considered and data on the attributes of these applications germane to solar photovoltaic systems application. (2) The expected profitability of photovoltaic applications was determined from the discounted future costs of conventional energy sources, capital costs, and projected operating and maintenance costs over the life of the system. This was combined with the energy consumption of the application to obtain an estimate of the energy market potential. (3) The application ranking and subjective evaluations of market size, diversity, and public exposure were used to select five applications and their locations for design of a suitable photovoltaic system. (4) For each of the selected applications, the various relevant characteristics were identified, potential photovoltaic system configurations were defined, and performance and economic models were used to design a representative system. The design of the selected system is described. DOE

PERFORMANCE EVALUATION OF A LOW-FIRST-COST, THREE-TON, AIR-TO-AIR HEAT PUMP IN THE HEATING MODE
A. A. Domingorena. Oct. 1978. 88 p. ref.
(Contract W-7405-eng-26)
(ORNL/CON-18). Avail: NTIS. HC A05/MF A01.

A low cost, air to air, split system residential heat pump of nominal 3 ton capacity was instrumented and tested in the heating mode under laboratory conditions. The system was tested under both steady state and frosting defrosting conditions. From the steady state tests, the heating capacity and coefficient of performance were determined and evaluations of fan performance, heat exchanger and capillary tube performance, compressor performance, and system heat losses were made. The frosting defrosting tests provided information for evaluating both system and component performance under dynamic conditions. Tests were also conducted to determine the effect of the amount of refrigerant charge on system performance. DOE

FACTORS AFFECTING POTENTIAL MARKET PENETRATION OF LASER FUSION POWER PLANTS
D. E. Deonigi and D. W. Fraley. Aug. 1979. 43 p. refs.
(Contract EY-76-C-06-1830)
(PNL-2803). Avail: NTIS. HC A03/MF A01.

A mini model constructed to estimate the optimal size of laser fusion power plants and to estimate the allowable cost of the first such plant in relation to the next best alternative is described. The mini model incorporates such factors as market penetration, learning, economies of scale, system size, transmission costs, reserve requirements, development and licensing costs and site costs. The results of the mini model simulations are discussed. DOE

N80-16553# New Mexico Energy Inst., Las Cruces.
PERFORMANCE EVALUATION OF THE NEW MEXICO STATE UNIVERSITY SOLAR HOUSE. Final Report, 1 Jan. 1977 - 1 Jul. 1979
Thomas R. Mancini, Philip R. Smith, and John L. Peterson. May 1979. 34 p. refs.
(PB-301225/9; NMEI-17). Avail: NTIS. HC A03/MF A01. CSCL 13A.

The conversion efficiency of the solar heated and cooled New Mexico State University house is evaluated. The design of the solar house which incorporates energy efficient elements of passive solar systems to minimize both the heating and cooling loads, is described. The liquid type solar system which employs flat plate collectors is examined. The performance evaluation consisted of sampling thirty six data points at ten minute intervals, monitoring the heating system and electrical power consumption of the solar equipment, and collecting environmental data such as solar radiation perpendicular to the plane of the collectors, wind speed, ambient temperature and relative humidity, and measuring the temperature and flowrate through the system. The data collection method is discussed and the instrumentation and accuracy of the measurements is reported. A.W.H.

COMPARATIVE ASSESSMENT OF RESIDENTIAL ENERGY SUPPLY SYSTEMS THAT USE FUEL CELLS: EXECUTIVE SUMMARY Final Report, Sep. 1976 - Jan. 1979

R. V. Steele, D. C. Bomberger, K. M. Clark, R. F. Goldstein, R. L. Hays, M. E. Gray, and G. Ciprios Apr. 1979 15 p
(Contract EPA-68-02-2180)
(PB-299207/1; EPA-600/7-79-105A) Avail: NTIS HC A02/MF A01 CSCL 10B

A comparison of residential energy supply systems using fuel cells is presented. All systems used coal as the primary energy source, and all residences were assumed to have identical heating and cooling demands. Five systems were analyzed in detail and the entire energy cycle, from coal mine to end use, was examined for costs, efficiency, environmental impact, and applicability. The five energy systems are: (1) a coal fired power plant supplying electricity and a coal gasification plant supplying SNG; (2) a 26 MW fuel cell power plant fueled by coal derived SNG supplying electricity; (3) a 26 MW fuel cell power plant fueled by coal derived naphtha supplying electricity; (4) a combined cycle power plant fueled by coal derived fuel oil supplying electricity; and (5) a 100 kW fuel cell power plant fueled by coal derived SNG. AN ANALYSIS OF THE FACTORS AFFECTING THE

DISTRIBUTION OF HEAVY METALS IN A TIDAL ESTUARY Ph.D. Thesis
Santo Vincent Grasso 1979 288 p
Avail: Univ. Microfilms Order No. 7928404

An analysis of the factors affecting the distribution of CD, Cu, Mn, Ni, Pb and Zn in the waters and sediments of the Hackensack River between River Mile 12 and 20.9 was conducted. The two major sources of metals to the area were found to be discharges from the Bergen County Sewerage Authority and contributions from runoff. For the year 1975, the Bergen County Sewerage Authority accounted for 100, 65, 99, 89, 57, and 80% respectively of the Cd, Cu, Mn, Ni, Pb, and Zn discharged into the area. Runoff accounted for most of the remaining portion. Soluble nickel and zinc levels in the river water were similar to the levels contained in the EPA STORET data. The levels of the remaining metals showed marked deviations from the EPA data. Suspended metals were found to exhibit positive correlation with the percentage of fixed suspended matter. Dissert. Abstr.

N80-16574 California Univ., Los Angeles.
THE ENVIRONMENTAL PROTECTION AGENCY'S ROLE IN THE PROTECTION OF WETLANDS: EXAMINATION OF EPA'S PARTICIPATION IN THE SECTION 404 REGULATORY PROGRAM Ph.D. Thesis
Jacalyn Mae Spiszman 1979 193 p
Avail: Univ. Microfilms Order No. 8001407

The legislative history of Section 404 is examined along with the goals and objectives of the EPA's 1978 program plan. Issues which may adversely affect EPA's ability to meet 404 program goals are identified. Material for the analysis of issues is derived from interviews with key agency people, members of the technical community and members of public interest groups with expressed concern of protection of wetland resources. The issues are examined in detail and options for their resolution are considered. A case study is presented in order to illustrate more fully how such issues affect EPA's ability to implement its responsibilities under Section 404. Dissert. Abstr.

N80-16575*# National Aeronautics and Space Administration. Langley Research Center, Langley Station, Va.
SUMMARY OF AIRCRAFT RESULTS FOR 1978 SOUTHEASTERN VIRGINIA URBAN PLUME MEASUREMENT STUDY OF OZONE, NITROGEN OXIDES, AND METHANE
Gerald L. Gregory, Dewey E. Wornom, Joe J. Mathis, Jr., and Daniel I. Sebacher Washington Feb 1980 222 p refs
(NASA-TM-80146; L-12981) Avail: NTIS HC A10/MF A01 CSCL 13B

Ozone production was determined from aircraft and surface in situ measurements, as well as from an airborne laser absorption spectrometer. Three aircraft and approximately 10 surface stations provided air-quality data. Extensive meteorological, mixing-layer-height, and ozone-precursor data were also measured. Approximately 50 hrs (9 flight days) of data from the aircraft equipped to monitor ozone, nitrogen oxides, dewpoint temperature, and temperature are presented. In addition, each experiment conducted is discussed. A.R.H.

N80-16576*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.
COOLING TOWER WATER CONDITIONING STUDY
M. F. Humphrey and K. R. French 15 Dec 1979 44 p refs (Contract NAS7-100)
(NASA-CR-162691; JPL-PUB-79-104) Avail: NTIS HC A03/MF A01 CSCL 13B

Successful elimination of cooling tower treatment chemicals was demonstrated. Three towers functioned for long periods of time with ozone as the only treatment for the water. The water in the systems was reused as much as 30 times (cycles of concentration) without deleterious effects to the heat exchangers. Actual system blow-down was eliminated and the only makeup water added was that required to replace the evaporation and mist entrainment losses. Minimum water savings alone are approximately 75.1 l/kg/year. Cost estimates indicate that a savings of 55 percent was obtained on the systems using ozone. A major problem experienced in the use of ozone for cooling tower applications was the difficulty of accurate concentration measurements. The ability to control the operational characteristics relies on easily and accurately determined concentration levels. Present methods of detection are subject to inaccuracies because of interfering materials and the rapid destruction of the ozone. J.M.S.

RESEARCH PLAN FOR ESTABLISHING THE EFFECTS OF TIME VARYING NOISE EXPOSURES ON COMMUNITY ANNOYANCE AND ACCEPTABILITY
Paul N. Borsky Jan. 1980 99 p refs
(Grant NsG-1616)
(NASA-CR-159197) Avail: NTIS HC A05/MF A01 CSCL 13B

The design of a community noise survey to determine the effects of time varying noise exposures in residential communities is presented. Complex physical and human variables involved in the health and welfare effects of environmental noise and the number-level tradeoffs and time of day penalties are among the factors considered. Emphasis is placed on community reactions where noise exposures are equal in day or evening but differ in the night time, and the effects of ambient noise on more intense aircraft noise exposures. Thirteen different times of day and types of operation situations with exposed populations up to 8-10 miles from the airport are identified. A detailed personal interview questionnaire as well as specific instructions to interviewers are included. J.M.S.

ALTITUDE CHARACTERISTICS OF SELECTED AIR QUALITY ANALYZERS Final Report
J. H. White, R. Strong, and J. B. Tommerdahl Nov. 1979 32 p
(NASA Order L-96783-A; RTI Proj. 43U-1833)
(NASA-CR-159165; RTI/1833/00-03F) Avail: NTIS HC A03/MF A01 CSCL 13B

The effects of altitude (pressure) on the operation and sensitivity of various air quality analyzers frequently flown on aircraft were analyzed. Two ozone analyzers were studied at altitudes from 600 to 7500 m and a nitrogen oxides chemiluminescence detector and a sulfur dioxide flame photometric detector were studied at altitudes from 600 to 3000 m. Calibration curves for altitude corrections to the sensitivuty of the instruments are presented along with discussion of observed instrument behavior. K.L.

OPTIMAL TREATMENT LEVELS OF A STREAM POLLUTION ABATEMENT SYSTEM UNDER THREE ENVIRONMENTAL CONTROL POLICIES. PART 2: PRELIMINARY SENSITIVITY ANALYSIS OF A CONVEX EQUIVALENT OF THE FIXED DISSOLVED OXYGEN REQUIREMENT POLICY GP MODEL USING SENSUMT
Anthony V. Fiacco and Abolfazl Ghaemi 29 Jun. 1979 45 p refs
(Contract N00014-75-C-0729)
(AD-A074216; SERIAL-T-405-Pt-2) Avail: NTIS HC A03/MF A01 CSCL 13/2

The sensitivity is analyzed of the optimal waste treatment cost of a water pollution control model, with respect to the parameters involved in the formulation of the model. This analysis is conducted for the policy mandating a fixed dissolved oxygen requirement, using an upper Hudson River data base. Details concerning the formulation and solution of this problem were reported in another paper. It is shown here that the maximum allowable dissolved oxygen deficit is unequivocally the parameter to which the optimal waste treatment cost is most sensitive. All of the many parameters involved in the model are analyzed and, relative to stipulated assumptions, are shown to have from significant to negligible impact on the waste treatment cost. GRA

STATUS OF POLLUTANT REMOVAL TECHNOLOGY FOR COAL FIRED PLANTS IN THE NORTHEASTERN U.S.

E. N. Ziegler (Polytechnic Inst. of N.Y., Brooklyn) and Ronald E. Meyers. Feb. 1979. 44 p. refs.
(Contract EY-76-C-02-0016)
(BNL-51004) Avail: NTIS HC A03/MF A01

The status of air pollution control technology for coal fired industrial and power plant boilers is surveyed. Lime and limestone based scrubbers, the Wellman-Lord, thiosorbic, and citrate processes, electrostatic precipitators, fabric filtration, and modification of the combustion system to reduce nitrogen oxide concentrations are among the technology items covered. Various process capital and annualized costs are reported for SO2 and particulate removal systems. The status of fluidized bed combustion, fuel desulfurization, coversion of coal to gaseous and liquid fuels, and flue gas denitrification is also discussed. DOE

PETROLEUM PRODUCTION AT MAXIMUM EFFICIENT RATE, NAVAL PETROLEUM RESERVE NO. 1 (ELK HILLS), KERN COUNTY, CALIFORNIA. Final Environmental Impact Statement
Aug. 1979. 525 p. refs.
(DOE/EIS-0012) Avail: NTIS HC A22/MF A01

The Naval Petroleum Reserves were opened up for production at maximum efficient rates consistent with sound engineering practices, for a period of 6 years. Production for Naval Petroleum Reserve No. 1 is expected to peak at between 205,000 and 240,000 bbl/d of crude oil in 1982. Positive impacts of the project are increased employment, use of vacant housing, increased local spending on goods and services, and the potential for increased domestic petroleum production with a commensurate decrease in the US balance of payment deficit. Adverse effects of the project include increased air pollution emissions, increased noise levels, reduction in vegetation, loss of the Petroleum Reserve for use in emergency situations, increased traffic levels, and decreased visual quality. DOE

TRACE ORGANIC COMPOUNDS IN THE NEW YORK CITY ATMOSPHERE. PART 1: PRELIMINARY STUDIES. Interim Report
J. M. Daisey, ed. 1979. 105 p. refs.
(EPRI-EA-1121) Avail: NTIS HC A06/MF A01

The kinds and concentrations of organic compounds present in New York City air, with particular emphasis on those classes which are biologically active (and which may pose a health hazard) were investigated. The results indicate the presence of alkylating agents, N-nitrosamines and peroxides as well as polycyclic aromatic hydrocarbons. Direct acting mutagens are also present in two polar and one nonpolar organic fractions of particulate matter. Very little seasonal variation was observed in the mutagenic activity (per microgram) of the organic fractions. Airborne concentrations of extractable organic matter in total suspended particulate matter (TSP) do not appear to have changed significantly from the levels of 9 to 12 micrograms/cu. m. although TSP has declined by more than 50 percent. DOE

HAOS QUALITY ASSURANCE FINAL REPORT: CRITERIA POLLUTANTS, VOLUME 1. Final Report
Dec. 1978. 119 p. refs.
(PB-299639/5; RAD-79-201-177-04-Vol-1; HAOS-13) Avail: NTIS HC A06/MF A01 CSCL 13B

A comprehensive quality assurance program was conducted to determine the validity and comparability of the data obtained during the monitoring phase. Audits were conducted for the following parameters: ozone, NOx, SO2, total hydrocarbons and methane, CO, and total suspended particulates. The results of the audits were generally good and demonstrated the validity and comparability of the data taken by the diverse monitoring groups. Although the SO2 and CO audit data were generally low and variable, good agreement was obtained for ozone, oxides of nitrogen, THC, CH4, and TSP. GRA

N80-16584# Radian Corp., Austin, Tex.
HAOS QUALITY ASSURANCE: NON-CRITERIA POLLUTANTS, VOLUME 2. Final Report
Mar. 1979. 132 p. refs.
(PB-299640/3; RAD-79-201-177-03-Vol-2; HAOS-14) Avail: NTIS HC A07/MF A01 CSCL 13B

Independent sensor audits or audit observations were conducted on the following perimeters: detailed hydrocarbons, PAN, total oxidants, human visibility, light scattering, visibility using telephotometry respirable particle sampling and analysis, aeroallergens, UV radiation, upper air meteorological measurements, and aldehydes. There were no known standards for some measurements and no approved standard reference methods to calibrate and audit others. Thus, accuracy determinations were difficult, if not impossible. Consequently, it was judged that it was more important to look for trends in the audit data which might explain any anomalies in the monitoring data, or which might identify problems in particular agency procedures. A LAGRANGIAN PHOTOCHEMICAL AIR QUALITY SIMULATION MODEL: ADAPTATION TO THE ST. LOUIS RAPS DATA BASE. VOLUME 1: MODEL FORMULATION. Final Report
Fred Lurman, Daniel Godden, Alan C. Lloyd, and Richard A. Nordsieck. Jun. 1979. 152 p. refs.
(Contract EPA-68-02-2765)
(PB-300470/2; EPA-600/8-79-015A-Vol-1) Avail: NTIS HC A08/MF A01 CSCL 04A

A Lagrangian photochemical air quality simulation model was adapted to the St. Louis, Missouri/Illinois metropolitan region and the Regional Air Pollution Study aerometric and emissions data base. This adaptation was performed to provide a means for EPA to independently assess the validity of a state-of-the-art Lagrangian photochemical model. Chemical kinetic oxidation mechanisms involving hydrocarbons, nitrogen oxides and sulfur oxides and a vertical diffusion formulation for modeling reactive pollutants in the troposphere are described. Methods for determining model input parameters are discussed and model results for ozone, nitrogen dioxide, carbon dioxide, sulfur dioxide, and sulfate are presented. GRA

(PB-300582/4; NSF/RA-790107) Avail: NTIS HC A99/MF A01 CSCL 13B

Capabilities were developed to predict the concentrations of NO3(-) in drainage waters that move through the root zone of irrigated croplands and become effluents in tile drains or that move by unsaturated flow to the saturated zone. The kinetics of nitrogen transformations were studied by measuring N transformations from urea through the oxidative process to NO3(-) and

then back to gaseous forms by denitrification and testing kinetic models of these processes. An attempt was made to determine the influence of soil morphology and soil profile characteristics on NO3(-) leaching from the soil-root zone in bench-mark soils. An N balance was approximated for the Santa Maria Valley based on N inputs, crop removals, leaching losses, and losses by denitrification. GRA

OXIDANT AIR POLLUTION IMPACT TO THE FORESTS OF EASTERN UNITED STATES: A LITERATURE REVIEW
John M. Skelly and J. William Johnson. Apr. 1979. 39 p. refs.
(Contract EPA-CC71142-J)
(PB80-103500; EPA-600/3-79-045) Avail: NTIS HC A03/MF A01 CSCL 06F

A review of past studies that have attempted to delineate measurable and/or possible impacts of photochemical oxidants on the forests of eastern United States is presented. Sources of oxidant precursors and subsequent long distance transport phenomena are reviewed and documented. Potential threats to eastern forest tree species are reviewed through a comparison of various fumigation studies in laboratory and field situations. The concept of hidden injury is discussed as being a possible major impact problem facing analysis of real losses. Evidence is presented that suggests that many forest tree species indigenous to the eastern United States may already be detrimentally impacted by previous high oxidant episodes. GRA

SALTWATER-BARRIER LINE IN FLORIDA: CONCEPTS, CONSIDERATIONS, AND SITE EXAMPLES
Jerry L. Hughes. Jun. 1979. 38 p. refs. Prepared in cooperation with Florida Dept. of Environmental Regulations, Tallahasssee
(PB80-101306; USGS/WRI-79/75;
USGS/WRD/WRI-79/073) Avail: NTIS HC A03/MF A01 CSCL 13B

The hydrologic concepts and fundamentals of saltwater intrusion in surface water channels and associated ground water systems are discussed in relation to a saltwater barrier line in Florida. The hydrological principles controlling saltwater intrusion along canals and streams and their significance in establishing a saltwater barrier line are discussed. The history of existing salinity barrier structures and their effectiveness in controlling saltwater intrusion are examined. The maintaining of a saltwater barrier line in the areas where such a line was established is described. A.W.H.

DESIGN, FABRICATION AND TESTING OF THE AIR-JET OIL BOOM Final Report
Steven H. Cohen and William T. Lindenmuth. Jun. 1979. 140 p. refs.
(Contract EPA-68-03-2497)
(PB80-102635; EPA-600/7-79-143) Avail: NTIS HC A07/MF A01 CSCL 13B

The boom presented has the capability to divert oil slicks under wave and current conditions that normally preclude the development of conventional booms. This boom can divert oil slicks at 3 knots with 85 percent efficiency when at 30 deg to the flow. The key operational feature is a continuous, horizontally oriented air jet ejected from along the boom at the water's surface. Overall, each boom module is about 33 feet long and 2 feet in diameter. Major components include two inflatable sections (ducts) to support the continuous air-jet nozzle and a center support float/jet pump. Some unique features of the structural design are low draft (1 inch) and excellent compliance to waves. Furthermore, the sections are both lightweight and highly compactible for storage. GRA

REMOTE SENSING OF SULFUR DIOXIDE EFFECTS ON VEGETATION - PHOTOMETRIC ANALYSIS OF AERIAL PHOTOGRAPHS
C. Daniel Sapp Jun. 1979 42 p refs
(PB-300460/3; TVA/ONR-79/01; EPA-600/7-79-138) Avail: NTIS HC A03/MF A01 CSCL 13B

Spectral reflectances were measured by tri band densitometry of aerial color infrared photographs of soybean Glycine mass fields that had been affected by sulfur dioxide (SO2) emissions from large, coal fired power plants in northwestern Alabama and western Tennessee. The photographs were photometrically calibrated. Results indicate that, at very light levels of foliar injury, the infrared to red reflectance ration decreased with increasing injury. This behavior was in accordance with theory. At moderate and severe levels of injury, the ratio increased with injury. The best indicator of crop yield was green band reflectance, but the red and infrared bands were nearly as good. The yield variable actually increased with the level of injury, apparently because of field to field variations in canopy density. GRA

ENVIRONMENTAL ASSESSMENT OF STATIONARY SOURCE NOx CONTROL TECHNOLOGIES Annual Report, Jun. 1977 - Jun. 1978
L. R. Waterland, K. J. Lim, K. G. Salvesen, R. M. Evans, E. G. Higginbotham, and H. B. Mason Jun. 1979 203 p refs
(Contract EPA-68-02-2160)
(PB-300469/4; EPA-600/7-79-147; AR-2) Avail: NTIS
HC A10/MF A01 CSCL 13B

Program results are summarized for: (1) developing fuel consumption and NOx emission inventories; (2) field testing selected stationary combustion sources; (3) performing process engineering and environmental assessment studies of NOx controls applied to utility and industrial boilers and gas turbines; and (4) developing reactive air quality and source analysis models. Preliminary NOx control technology analysis for utility boilers indicates that off-stoichiometric combustion and low NOx burners (LNB) are the preferred techniques for both retrofit and new applications. For coal firing, overfire air operation and LNB are both cost effective; LNB is preferred for new wall-fired boilers. For oil and gas firing, staged combustion with burners out of service is recommended. GRA

EVALUATION OF THE ULTRAVIOLET-OZONE AND ULTRAVIOLET-OXIDANT TREATMENT OF PINK WATER Final Report, 6 Jun. 1976 - 30 Dec. 1977
Milton Roth and Joseph M. Murphy, Jr. Jul. 1979 41 p refs
(PB-300763/0; EPA-600/2-79-129) Avail: NTIS
HC A03/MF A01 CSCL 13B

Pink water, a solution of trinitrotoluene (TNT) and other nitrobodies, is a major pollutant at ammunition plants engaged either in the manufacture of TNT or in the loading, assembly, and packing of bombs and shells. As an alternative to carbon adsorption for the treatment of pink water, two new methods are presented and evaluated. The first involves the use of ultraviolet (uv)-ozone and the second uses a uv-oxidant combination. Commercially available uv water purification units in conjunction with an oxidant such as hydrogen peroxide or Oxone, (a blend of potassium persulfate oxidants), were evaluated for their efficiency in treating pink water. Variables such as film depth, dilution, uv wavelength, and operation of the units in series rather than in parallel were examined. GRA

DEVELOPMENT OF AN SO2 MONITOR FOR MOBILE SOURCES Final Report, Oct. 1976 - Jan. 1978
Darrell E. Burch, Pamela S. Marrs Davila, Francis J. Gates, and John D. Pembrook Jul. 1979 52 p refs
(Contract EPA-68-02-2448)
(PB80-100472; EPA-600/2-79-121; U-6392) Avail: NTIS HC A04/MF A01 CSCL 14B

An instrument designed to monitor the concentration of SO2 in the exhaust of mobile sources is discussed. A pump and manifold assembly permit operation over a wide range of sample flow rates. The sample cell contains a multiple-pass optical system adjusted to 12 passes, giving a sample path length greater than 5 m. The rms noise level corresponds to approximately 0.05 ppm of SO2 when the electronic time constant is 1 sec. GRA

N80-16607# Ford Aerospace and Communications Corp., Newport Beach, Calif. Aeroneutronic Div.
DEVELOPMENT OF A MONITOR FOR HCN IN MOBILE SOURCE EMISSIONS Final Report, Apr. 1977 - Oct. 1978
Darrell E. Burch, Pamela S. Marrs Davila, Francis J. Gates, and John D. Pembrook Jun. 1979 44 p refs
(Contract EPA-68-02-2716)
(PB80-100514; U-6470; EPA-600/2-79-113) Avail: NTIS HC A03/MF A01 CSCL 13B

Three real-time monitors for measurement of HCN concentrations in mobile source emissions were designed, built, tested, and delivered to the Environmental Protection Agency. The important design parameters for these identical instruments were determined with a versatile gas-filter correlation spectrometer. The instruments employ a gas-filter cell to provide sensitivity to HCN while discriminating against other infrared active gases such as H2O, CO2, NH3 and many hydrocarbons that occur in mobile source emissions. The combined error after accounting for H2O interference for most dilute samples is less than 0.1 ppm HCN. GRA

AN ANALYSIS OF ALTERNATIVE POLICIES FOR ATTAINING AND MAINTAINING A SHORT-TERM NO2 STANDARD
Robert J. Anderson, Robert O. Reid, and Eugene D. Seskin 17 Sep. 1979 385 p refs Sponsored in part by Council on Environmental Quality, Washington, D.C., and Council on Economic Advisors, Washington, D.C.
(PB80-100530; EPA-230/3-79-011) Avail: NTIS HC A17/MF A01 CSCL 13B

The results of an analysis of alternative policies for implementing short term NO2 standards like those currently under consideration by EPA are summarized. Policy alternatives considered include an extension of current regulatory approaches to provide for control of stationary source emissions in state implementation plans, adoption of an emissions charge as a substitute for emissions limitation regulations, and adoption of a marketable permit program as a substitute for emissions limitation regulations. THE MAXIMUM LIKELIHOOD APPROACH TO PROBABILISTIC MODELING OF AIR QUALITY DATA Final Report
Terence Fitz-Simons and David M. Holland Jul. 1979 43 p refs
(PB80-104110; EPA-600/4-79-044) Avail: NTIS HC A03/MF A01 CSCL 12A

Software using maximum likelihood estimation to fit six probabilistic models is discussed. The program fits data to the normal distribution, the 3-parameter lognormal distribution, the 3-parameter Weibull distribution, the 3-parameter gamma distribution, the Johnson S(B) distribution, and the 4-parameter beta distribution. Six goodness-of-fit criteria are supplied and ranked by the program to aid in the selection of the most appropriate choice among the six models. The results of applying the program to several subsets of the Los Angeles Catalyst Study data base are presented. GRA

ATMOSPHERIC REACTION PRODUCTS OF ORGANIC COMPOUNDS Final Report
Dale G. Hendry and Richard A. Kenley Jun. 1979 90 p refs
(Contract EPA-68-01-5123)
(PB-301384/4; EPA-560/12-79-001) Avail: NTIS HC A05/MF A01 CSCL 04A

A procedure that predicts the products from reaction of compounds in the atmosphere was developed for use in unreasonable-risk evaluations that include assessing new chemicals for persistence and exposure in the environment in this procedure, the relative importance of the three dominant reaction pathways photolysis, reaction with OH radical, and reaction with ozone are first determined for each compound. Then the products from each pathway that play a major role for that compound are estimated using the techniques outlined in the methods. GRA

DETAILED CHARACTERIZATION OF GASEOUS AND SIZE RESOLVED PARTICULATE POLLUTANTS AT A SOUTH COAST AIR BASIN SMOG RECEPTOR SITE: LEVELS AND MODES OF FORMATION OF SULFATE, NITRATE AND ORGANIC PARTICULATES AND THEIR IMPLICATIONS FOR CONTROL STRATEGIES Final Report, Nov. 1975 - Jun. 1978
James N. Pitts, Jr. and Daniel Grosjean Jul. 1979 466 p refs
(PB-301294/5; ARB-R-5-384-79-100) Avail: NTIS HC A20/MF A01 CSCL 04A

A two-year research program was conducted to characterize gas phase pollutants, aerometric variables, visibility, aerosol elemental composition, and ambient levels and size distribution of particulate sulfate, nitrate, and ammonium at Riverside, a smog receptor site located at the eastern end of the California South Coast Air Basin. The data base generated was employed: (1) to establish diurnal and seasonal profiles for gaseous and particulate pollutants; (2) to calculate sulfur and nitrogen gas-particle distribution factors; (3) to correlate sulfate and nitrate levels with indicators of photochemical and aqueous aerosol formation mechanisms; and (4) to develop relationships between visibility impairment, aerosol concentration, and aerosol chemical composition. WEEKEND/WEEKDAY DIFFERENCES IN OXIDANTS AND THEIR PRECURSORS Final Report
Yuji Horie, Joseph Cassmassi, Larry Lai, and Louis Gurtowski Mar. 1979 152 p refs
(Contract EPA-68-02-2595)
(PB-300479/3; EPA-450/4-79-013) Avail: NTIS HC A08/MF A01 CSCL 04A

Differences between weekend and weekday oxidant and oxidant precursor concentrations in the Northeastern United States are examined. Statistical tests were employed to assess whether any differences in daily maximum oxidant concentrations are significant. The analyses revealed that oxidant concentrations downwind of major urban areas tend to be lower on weekends. However, the reductions are not as large as those observed in precursor concentrations within the major urban areas. Reductions in weekend oxidant concentrations at locations within the major urban areas are not as great as those at downwind locations. GRA

THE ENVIRONMENTAL PROTECTION AGENCY FOUR CORNERS AMBIENT AIR MONITORING NETWORK
Jun. 1979 99 p refs
(Contract EPA-68-03-2345)
(PB80-103559; EPA-600/7-79-135) Avail: NTIS HC A05/MF A01 CSCL 13B

An air quality base line for the Four Corners area of Arizona, Colorado, New Mexico, and Utah was established. The base line was used in assessing the impact of the development of coal deposits and the operation of large, coal fired, electrical generating plants in the Four Corners area. A network of 29 monitoring stations was established to obtain data concerning the air quality in a predominantly rural area covering a multistate region. Results were evaluated in terms of the total suspended particulates present in the ambient air at each of the 29 monitoring stations on a seasonal basis. Results also were evaluated in terms of the validity of the sampling and analytical procedures. GRA

EVALUATION OF STATIONARY SOURCE PARTICULATE MEASUREMENT METHODS. VOLUME 3: GAS TEMPERATURE CONTROL DURING METHOD 5 SAMPLING Interim Report, Oct. 1973 - Feb. 1977
Edward T. Peters and Jeffrey W. Adams Jun. 1979 32 p refs
(Contract EPA-68-02-0632)
(PB-300336/5; EPA-600/2-79-115-Vol-3) Avail: NTIS HC A03/MF A01 CSCL 14B

Changes in gas temperature were measured along the length of a Method 5 sampling train due to variations in stack gas temperature, sampling rate, filter box temperature and method for controlling the probe heating element. For each run condition, temperatures were measured in the stack, at ambient and at four internal and external positions along the sampling train at one minute intervals. Measurements were continued until the system was observed to reach a state of thermal equilibrium. The results demonstrate that gas temperatures cannot be predicted or controlled on the basis of externally measured temperatures. GRA

POTENTIAL PRODUCTION AND MARKETING OF FGD BYPRODUCT SULFUR AND SULFURIC ACID IN THE US (1983 PROJECTION) Final Report, Jun. 1976 - Dec. 1978
W. E. OBrien and W. L. Anders Apr. 1979 59 p refs
(PB-299205/5; ECDP-B-1; EPA-600/7-79-106) Avail: NTIS HC A04/MF A01 CSCL 13B

Least costs of compliance were calculated using comparisons of clean fuel with 50 cents and 70 cents/million Btu premiums, limestone scrubbing, and scrubbing systems with byproduct sulfur and H2SO4 production. Market potential of sales of sulfur burning H2SO4 plants was also determined. At the 50 cent premium, H2SO4 production was the least cost method at five plants, four of which had combined sales of 800,000 tons/yr. At the 70 cent premium, H2SO4 production was the least cost method at 26 plants, 7 of which had sales totalling 1.2 million tons. Other significant observations and results are reported. GRA

ICHTHYOPLANKTON ABUNDANCE AND DIVERSITY IN THE EASTERN GULF OF MEXICO Final Report
Edward D. Houde, James C. Leak, Catharina E. Dowd, Steven A. Berkeley, and William J. Richards Jun. 1979 581 p refs
Prepared in cooperation with National Marine Fisheries Service, Miami, Fla.
(Contract DI-AA550-CT7-28)
(PB-299839/1; BLM/YM/ES-79/10) Avail: NTIS
HC A25/MF A01 CSCL 13B

An ichthyoplankton survey in the eastern Gulf of Mexico was carried out to determine the kinds and abundances of larval fishes, their distribution and diversity, and the relationship of their occurrence to environmental factors. Important baseline data on the early life stages of fishes in the Gulf of Mexico are presented. Effects of environmental factors on ichthyoplankton abundances are not clearly demonstrated but the modes and ranges of surface temperature, surface salinities and station depths where common species occurred are clearly defined. Positive affinities of some species with water of Loop Current origin, when it intruded into coastal areas, are demonstrated for several species. GRA

GEOLOGY OF PRECAMBRIAN METAMORPHIC ROCKS OF THE TRUCHAS PEAKS AREA, NORTH-CENTRAL NEW MEXICO Ph.D. Thesis
Jeffrey Arthur Grambling 1979 269 p
Avail: Univ. Microfilms Order No. 7928471

Detailed mapping in the Trucha Peaks region of north-central New Mexico delineates a deformed and metamorphosed Proterozoic terrane which contains an apparent equilibrium occurrence of the Al2SiO5 triple point. Various dehydration equilibria define the pressure and temperature of crystallization of assemblages which include coexisting kyanite, andalusite, and sillimanite. Geologic evidence, consisting of corresponding lithologies, fold axes, and isograds, suggests that rocks of the Truchas and Picuris Ranges were once adjacent, forming part of an extensive quartzite terrane which has been split apart by 37 km of right lateral motion along the Picuris-Pecos fault. The quartzitic Truchas Group forms part of a Proterozoic greenstone-quartzite association. Minor amounts of metavolcanic materials, which probably originated in the greenstone belt and lapped onto the quartzite platform, are interstratified with massive quartzite near Truchas Peak. These relationships indicate that the greenstone belt and quartzite platform existed side by side. Dissert. Abstr.

N80-16627 Stanford Univ., Calif.
EVOLUTION OF THE LATE PENNSYLVANIAN-EARLY PERMIAN WESTERN OQUIRRH BASIN, UTAH Ph.D. Thesis
Teresa Eileen Jordan 1979 287 p
Avail: Univ. Microfilms Order No. 8001948

The topographic and structural nature of the Oquirrh basin and the depositional mechanisms responsible for the strata are discussed. The sedimentary and structural history of the basin in the Late Pennsylvanian and Early Permian is emphasized. Field study of the western upper Oquirrh Group focused upon measurement, description, and sampling of six detailed sections and reconnaissance study of adjacent areas. The fourteen lithofacies present are dominated by subarkosic arenite and clastic limestone. The distributions of trace fossils and body fossils and paleoecologic interpretations reveal a gradient of water depths spatially and through time. Fusulinid biostratigraphy permits construction of an accurate time framework in which to examine lithologic and paleoecologic trends. Dissert. Abstr.

SUBSURFACE STRATIGRAPHY OF THE MIDDLE AND UPPER DEVONIAN CLASTIC SEQUENCE IN SOUTHERN WEST VIRGINIA AND ITS RELATION TO GAS PRODUCTION Ph.D. Thesis
Donald Wade Neal 1979 305 p

Avail: Univ. Microfilms Order No. 8000226

A stratigraphic framework for the Middle and Upper Devonian clastic sequence in the subsurface of southern West Virginia was established using gamma-ray logs, drillers' logs, and sample descriptions. The Devonian shale within the study area is submature with respect to hydrocarbon generation yet produces a high quality gas. An interconnected fracture system is postulated to be the reservoir in which gas accumulates where there is the complimentary presence of both thick intervals of black shale and broad flexures which produce fractures. New areas of potential shale gas exploration for both the Huron Member of the Ohio Shale and the Rhinestreet Shale-Marcellus Shale interval are located east of the Warfield Anticline in Boone, Logan, Mingo, McDowell, Wyoming, and Raleigh Counties, West Virginia.

Dissert. Abstr.

STRATIGRAPHY AND SEDIMENTOLOGY OF THE UPPER DEVONIAN CATSKILL AND UPPERMOST TRIMMERS ROCK FORMATIONS IN CENTRAL PENNSYLVANIA Ph.D. Thesis
Victor David Kh. Rahmanian 1979 396 p
Avail: Univ. Microfilms Order No. 7922333

Stratigraphy and the depositional history of formations in central and southcentral Pennsylvania are investigated. The uppermost parts of the Trimmers Rock formation and the Catskill formation are described. Paleoenvironmental synthesis of the facies relationships indicates that the Upper Devonian sedimentary units in the area are the products of deposition in a complex prograding deltaic-intradeltaic coast and its associated higher alluvial-coastal plain. The main sediment input area, located in central Pennsylvania, was characterized by an active river system in the alluvial plain which graded down slope into a tidally dominated delta along the shoreline. The intradeltaic regions to the north and south were characterized by broad tidal flats which developed both along the nonconfined coast and the ice side or behind barrier island systems. The results of the petrographic analysis of the sandstone samples are discussed.

Dissert. Abstr.

N80-16630 Princeton Univ., N. J.
GEOLOGY OF THE ACARIGUA AREA, VENEZUELA Ph.D. Thesis
Grant Michael Skerlec 1979 301 p
Avail: Univ. Microfilms Order No. 7928488

In the Acarigua area the Caribbean Mountains consist of three tectonic belts that are continuations of similar belts found farther to the east. The western Caribbean Mountains contain a series of low-angle thrust faults that place the metasediments of the Cordillera de la Costa Belt over the lower grade metasediments of the Central Belt, which is thrust in turn over the Rio Guache Formation. The offset of these basal thrust faults by a complex series of high-angle faults suggests that the maximum possible amount of right-lateral strike-slip displacement along the Bocono fault is 50 kilometers and that no strike-slip displacement at all need have occurred. Isopach data for Cretaceous platform sediments suggest that the western limit of thrust faulting was caused by a thinning of decollement horizons along a pronounced northsouth jog in the Venezuelan continental margin.

Dissert. Abstr.

PRELIMINARY GEOLOGIC APPRAISAL AND ECONOMIC ASPECTS OF THE PRECAMBRIAN BASEMENT OF IOWA Ph.D. Thesis
Abdolmajid Yaghubpur 1979 397 p
Avail: Univ. Microfilms Order No. 7928633

Precambrian samples from 85 wells, 10 isotopic age determinations, local and regional geophysical data, plus information from surrounding states permit identification of 14 rock units assigned to the Penokean, Eastern Iowa, and Keweenawan Precambrian Provinces. In the Penokean Province, a taconite body, located about 3 miles west of Matlock, Sioux County, is flanked by serpentinite that contains traces of chromite and nickel sulfide. Also, layered-type orthomagmatic titaniferous magnetite deposits are located at Osborne, Clayton County, and Spencer, Clay County. Associated with the Spencer deposit are minor amounts of pyrrhotite and traces of chalcopyrite, whereas vanadium in titanomagnetite is common to both. Several other mineral resource occurrences may exist, particularly stratiform copper deposits in Keweenawan Terrane and uncomformity-type uranium deposits related to the basal Sioux Quartzite contact.

PLATE MOTIONS RELATIVE TO THE PALEOMAGNETIC AXIS AND THE LOWER MANTLE Ph.D. Thesis
Richard Garth Gordon 1979 151 p
Avail: Univ. Microfilms Order No. 8001927

The estimation of absolute plate motions is extended to the geologic past and used to test models of absolute motions and plate driving forces. A method for estimating the absolute plate velocity of an individual plate from its ridge and trench boundary is proposed along with a technique for the estimation of the minimum rms velocities relative to the paleomagnetic axis of three major continents since the Devonian. A method is developed using nonlinear least squares and miximum likelihood statistics and applied to the Campanian paleomagnetic data available from the Pacific plate. Paleomagnetic data from India and Australia, the apparent polar wander path of the Pacific plate, and the seafloor spreading histories of the Indian Ocean and southwest Pacific Ocean are used to demonstrate that there was large tertiary relative motion between east and west Antarctica.

Dissert. Abstr.

N80-16636 California Inst. of Tech., Pasadena.
PHYSICS OF MANTLE AND CORE MINERALS Ph.D. Thesis
Raymond Jeanloz 1980 412 p
Avail: Univ. Microfilms Order No. 8002588

Shock wave equation of state data are used to evaluate theoretically calculated properties of the earth's core. Hugoniot

data for MgO and SiO2 suggest that the core is a major heat source for the mantle and that a barrier to convection occurs in the lower mantle. This inference is consistent with shock wave data for CaO which show that calcium could be substantially enriched in the lower mantle. Data for bronzite, olivines, and pyroxenes are consistent with static high pressure results, but suggest the occurrence of post-perovskite phases and also provide evidence for nonequilibrium effects. Although the bulk properties measured under shock are consistent with the attainment of thermodynamic equilibrium, these properties apparently represent highly transient and nonequilibrium states. Dissert. Abstr.

N80-16637 California Univ., Berkeley.
INVESTIGATION OF SEISMIC SOURCES BY THE LINEAR INVERSION OF SEISMOGRAMS Ph.D. Thesis
Brian William Stump 1979 279 p
Avail: Univ. Microfilms Order No. 8000528

A method was developed allowing the direct inversion of seismograms to obtain an estimate of the seismic point source, as characterized by its equivalent first degree force moment tensor. The problem was shown to be linear in both the frequency and time domains and least squares methods were used to estimate the source mechanism. In the synthetic tests that were run, several possible uses of the method were investigated. With a satisfactory station distribution, the source mechanism was recovered using complete seismograms from three component stations or several P arrivals on vertical components. The method was useful in distinguishing multiple events including explosions. The errors of the fits were determined and yield information such as the bandwidth of useful data in the frequency domain and error estimates for fault plane solutions in the time domain fits. Dissert. Abstr.

PETROLOGY AND STRATIGRAPHY OF PALEOGENE NONMARINE SANDSTONES, CASCADE RANGE, WASHINGTON Ph.D. Thesis
Virgil Allen Frizzell, Jr. 1979 169 p
Avail: Univ. Microfilms Order No. 8001919

A compositional and stratigraphic analysis of the Cascade range north of 47 deg latitude is presented. Results show a range composition of probable Paleozoic and Mesozoic metamorphic rocks and Mesozoic and Tertiary plutonic rocks. Several Paleogene nonmarine arkosic sandstone units fringe and in part occur within the complex crystalline core. The various formations are all composed predominantly of fine- to medium-grained sandstones with lesser amounts of interbedded shale, conglomerate, and coal. Compositionally, the units are predominantly either feldspathic or litho-feldspathic subquartzose sandstones. Modal analysis is performed on samples from the various sedimentary units to establish petrologic compositions and to provide data with which to compare the different units and discuss clast provenance and tectonic regimen. Dissert. Abstr.

THE EFFECTS OF PORE FLUIDS AND FRICTIONAL SLIDING ON SEISMIC ATTENUATION Ph.D. Thesis
Kenneth William Winkler 1979 195 p
Avail: Univ. Microfilms Order No. 8002039

An experimental approach using bar resonance technique was adopted. One meter long bars of rock were vibrated in torsional and extensional modes at frequencies between about 500 and 1700 hertz. Confining pressure, pore pressure, degree of saturation and strain amplitude were all varied. Results indicate that pore fluids dominate seismic attenuation under the conditions of the experiments, conditions which are in many ways representative of the Earth's upper crust. In dry sandstone both P waves and shear waves show relatively small amounts of attenuation. Partial saturation (to about 95 percent) caused attenuation to increase by a factor of two to four and results in P waves being attenuated more strongly than shear waves. The transition to total saturation resulted in maximum shear wave attenuation, but caused a significant reduction in P wave attenuation. In fully saturated rock, shear waves were attenuated more strongly than P waves. Dissert. Abstr.

N80-16641 California Univ., Los Angeles.
STABILITY OF A TURBULENT LAYER CLOUD WITHIN THE PLANETARY BOUNDARY LAYER Ph.D. Thesis
Chin-Hoh Moeng 1979 161 p
Avail: Univ. Microfilms Order No. 8001387

A model for numerical simulations of a stratus cloud layer is constructed by combining a second-order closure turbulent transfer model with a thermal radiative transfer model. The turbulence-radiation combined model is applied to a horizontally uniform one dimensional case and a horizontally nonuniform two dimensional case. In the latter the dynamics of mesoscale circulations have also been incorporated. The two dimensional simulation reproduces the layer cloud instability where the sea surface temperature is high and the large-scale subsidence is weak. The simulated instability process has been analyzed in view of Randall's instability criterion, the eddy kinetic energy budget, and evaporative cooling near the cloud top. The growth rates of the instability are obtained using the linearized perturbation equations. Dissert. Abstr.

A CASE STUDY OF HEIGHT AND TEMPERATURE ANALYSES DERIVED FROM NIMBUS-6 SATELLITE SOUNDINGS ON A FINE MESH MODEL GRID Ph.D. Thesis
Thomas Lee Koehler 1979 204 p
Avail: Univ. Microfilms Order No. 7927181

Two sets of temperature profiles derived from the same set of Nimbus-6 radiance measurements were evaluated. The first set had an average horizontal spacing of about 300 km and was employed extensively in other impact studies. The second had a finer resolution, roughly a 150 km spacing. Several means of comparison are presented, including visual and statistical comparisons of the temperature and height fields, and comparisons of dynamic and energetic parameters derived from them. The results indicate that Nimbus-6 soundings were able to correctly position the major trough and ridge positions, but underestimate gradients in the analyses. The soundings exhibited a consistent warm bias, with maximum root mean squared errors of more than 3 C near the surface and tropopause. No advantage was found in using the satellite soundings with the finer resolution, mainly because of their higher noise level. Manual screening of the normal resolution soundings provided only minor improvements. Dissert. Abstr.

N80-16643 Maryland Univ., College Park.
METRIC-CONNECTION THEORIES OF GRAVITY Ph.D. Thesis
Phillip Barry Yasskin 1979 317 p
Avail: Univ. Microfilms Order No. 8002074

Using a method similar to that used by Papapetrou and Dixon in the context of metric theories, propagation equations for a body's momentum and and angular momentum are derived. These show that elementary particle spins feel the torsion but orbital angular momentum does not. Results indicate that in a metric theory, spin and orbital angular momentum propagate in the same way. A two tangent space formalism which gives geometrical insight into the presence of two connections was developed. The Christoffel connection acted on one of the tangent spaces (called the external tangent space) while the full connection acted on the other tangent space (called the internal tangent space). The isomorphism between the two tangent spaces (called the soldering isomorphism) corresponded to the orthonormal frame in the usual one tangent space formalism. Its covariant derivative

was the defect tensor which was the difference between the full connection and the Christoffel connection. Dissert. Abstr.

ON THE GENERATION OF AURORAL KILOMETRIC RADIATION Ph.D. Thesis
James Lauer Green 1979 157 p
Avail: Univ. Microfilms Order No. 7928581

Simultaneous observations between the Hawkeye spacecraft in the AKR emission cone and the low altitude polar orbiting spacecraft Triad and AE-D reveal that auroral kilometric radiation (AKR) is correlated with a variety of auroral particle precipitation in the evening to midnight local time sector. It is found that as the AKR intensity increases so does the integrated current sheet intensity of auroral zone field aligned currents observed by Triad increase from a survey of 257 simultaneous observations. Statistically, the linear correlation coefficient between the log of the AKR power flux and the log of the current sheet intensity is 0.57. The results presented indicate that kilometric radiation is generated by inverted-V electron distribution functions in a direct coupling mechanism between particle energy and R-X mode electromagnetic waves. Dissert. Abstr.

A CATALOG OF PERTURBING INFLUENCES ON STRATOSPHERIC OZONE, 1955-1975 Final Report, 15 Apr. - 15 Oct. 1978
E. Bauer Sep. 1978 200 p refs
(Contract DOT-FA77WA-3965)
(AD-A063650; P-1340; FAA-EQ-78-20) Avail: NTIS HC A09/MF A01 CSCL 04A

A list of all major time varying perturbations over a 20 year time frame is presented. Detailed consideration is given to the following: atmospheric nuclear explosions; galactic cosmic rays; solar proton events; relativistic (or energetic) electron precipitation, major volcanic eruptions; halocarbons (fluoro-, chloro-, and bromocarbons); fertilizer manufacture; and other industrial nitrogen fixation. For sources injected directly into the stratosphere, the time, altitude, and latitude dependent source strengths are listed, while for the ground based sources the time and latitude dependent production and atmospheric emission rates are given. Time variations of solar ultraviolet and of stratospheric temperature, and possible variations in stratospheric dynamics are also discussed. R.C.T.

ANALYSIS OF NUMERICAL IONOGRAMS. 3: THE VALLEY PROGRAM
A. K. Paul, T. L. Gulyaeva, L. F. McNamara, J. E. Titheridge, and J. W. Wright Oct. 1978 24 p refs
(IPS-X8) Avail: NTIS HC A02/MF A01

Accurate numerical ionograms corresponding to daytime electron density profiles containing an E-F valley have been analyzed by four different methods. It is found that the methods of analysis due to Paul and Titheridge can determine the height of the F layer just above the valley to within a few km. The method used by Wright, on the other hand, leads to underestimates of this height by about 10-20 km. For most profiles, Gulyaeva's method yields errors of 5-10 km, but in some cases overestimates of up to 30 km can occur. Author

POTENTIAL UTILIZATION OF THE NASA/GEORGE C. MARSHALL SPACE FLIGHT CENTER IN EARTHQUAKE ENGINEERING RESEARCH
Roger E. Scholl, ed. Dec. 1979 234 p refs Sponsored in part by NSF
(Contract NAS8-33220)
(NASA-CR-161371) Avail: NTIS HC A11/MF A01 CSCL 08K

Earthquake engineering research capabilities of the National Aeronautics and Space Administration (NASA) facilities at George C. Marshall Space Flight Center (MSFC), Alabama, were evaluated. The results indicate that the NASA/MSFC facilities and supporting capabilities offer unique opportunities for conducting earthquake engineering research. Specific features that are particularly attractive for large scale static and dynamic testing of natural and man-made structures include the following: large physical dimensions of buildings and test bays; high loading capacity; wide range and large number of test equipment and instrumentation devices; multichannel data acquisition and processing systems; technical expertise for conducting large-scale static and dynamic testing; sophisticated techniques for systems dynamics analysis, simulation, and control; and capability for managing large-size and technologically complex programs. Potential uses of the facilities for near and long term test programs to supplement current earthquake research activities are suggested. DOE

PROCESSING OF MULTISPECTRAL THERMAL IR DATA FOR GEOLOGIC APPLICATIONS
Anne B. Kahle, Daryl P. Madura, and James M. Soha 15 Nov. 1979 43 p refs Original contains color illustrations
(Contract NAS7-100)
(NASA-CR-162682; JPL-PUB-79-89) Avail: NTIS HC A03/MF A01 CSCL 08G

Multispectral thermal IR data were acquired with a 24-channel scanner flown in an aircraft over the E. Tintic Utah mining district. These digital image data required extensive computer processing in order to put the information into a format useful for a geologic photointerpreter. Simple enhancement procedures were not sufficient to reveal the total information content because the data were highly correlated in all channels. The data were shown to be dominated by temperature variations across the scene, while the much more subtle spectral variations between the different rock types were of interest. The image processing techniques employed to analyze these data are described. J.M.S.

VERTICAL MOVEMENT ALONG THE CERRO PRIETO TRANSFORM FAULT, BAJA CALIFORNIA, MEXICO - A

MECHANISM FOR GEOTHERMAL ENERGY RENEWAL
S. VonderHaar, J. E. Noble, and I. Puente Cruz. Mar. 1979. 8 p. refs. Prepared jointly by Comision Federal de Electricidad, Mexico City.
(Contract W-7405-eng-48)
(LBL-8905) Avail: NTIS HC A02/MF A01

Data from 53 geothermal wells to depths of 1 to 3 km on either side of the right-lateral Cerro Prieto fault, as well as geophysical data, indicate vertical displacements of this fault of 400 to 600 m. This episodic vertical movement has offset deltaic sandstone reservoirs that are primarily at 1200 m and 1800 m depth and contain 250 to 345 C water. A major fracture system for convective fluid movement has been thus maintained, with production at 150 MW. DOE

PROBABILISTIC SEISMIC STABILITY ANALYSIS: A CASE STUDY
D. A-Grivas and G. Nadeau. Jul. 1979. 42 p. refs.
(Grant NSF ENV-77-16185)
(PB-301291/1; NSF/RA-790131; CE-79-1) Avail: NTIS HC A03/MF A01 CSCL 08K

An application of a probabilistic seismic stability analysis to a natural slope located near Slingerlands, New York, is given. The safety of the slope is measured in terms of its probability of failure rather than the customary factor of safety. Three types of earthquake sources are investigated, namely, a point, a line and an area source, and the dependence on significant seismic parameters of the probability of failure of the slope is examined. On the basis of the results obtained, it is concluded that the present model is useful in assessing the reliability of soil slopes under both static and seismic conditions and the probability of failure of a soil is greatly affected by the type of the earthquake source involved and by the values of seismic parameters that are associated with it. GRA

A PROBABILISTIC MODEL FOR SEISMIC SLOPE STABILITY ANALYSIS
D. A-Grivas, J. Howland, and P. Tolcser. Jun. 1979. 98 p. refs.
(Grant NSF ENV-77-16185)
(PB-301369/5; NSF/RA-790130; CE-78-5) Avail: NTIS HC A05/MF A01 CSCL 08K

A model for probabilistic stability analysis of earth slopes under earthquake loading is presented. Significant uncertainties associated with conventional pseudo-static methods of seismic stability analysis are recognized and probabilistic tools are introduced for their description and amelioration. The proposed method of analysis accounts for: the variability of material strength parameters; the uncertainty in the exact location of potential failure surfaces; and the uncertainty in the value of the maximum slope acceleration during an earthquake. GRA

SOIL STRUCTURE INTERACTION IN DIFFERENT SEISMIC ENVIRONMENTS
Alberto Gomez-Masso (Woodward-Clyde Consultants, San Francisco), John Lysmer (Calif. Univ., Berkeley), Jian-Chu Chen (Calif. Univ., Lawrence Livermore Lab., Livermore), and H. Bolton Seed (Calif. Univ., Berkeley). Aug. 1979. 58 p. refs.
(Contract NSF ENV-76-23277)
(PB80-101520; UCB/EERC-79/18; NSF/RA-790240) Avail: NTIS HC A04/MF A01 CSCL 18E

A plane-strain method for soil structure interaction analysis consisting of the superposition of the free field motions and the interaction motions, in a generalized seismic environment is presented. The free field is modeled as a horizontally layered viscoelastic medium and the seismic environment may consist of a combination of S, P and Rayleigh waves. The soil structure system is modeled with viscoelastic finite elements, transmitting boundaries, viscous boundaries, and a 3 dimensional simulation. Comparative analyses of the same structure are conducted for an input of R waves and for vertically propagating S and P waves in a rock site and sand site. GRA

BASELINE CORRECTION OF EARTHQUAKE RECORDS IN THE FREQUENCY DOMAIN
E. Kausel and R. Ushijima. Jul. 1979. 84 p.
(Grant NSF ENV-77-18339)
(PB80-102056; MIT-CE-R79-34; NSF/RA-790180) Avail: NTIS HC A05/MF A01 CSCL 08K

Various integration schemes for discrete functions in the frequency domain were examined and procedures to perform a parabolic baseline correction to earthquake records in this domain were developed. Only for acceleration records having zero mean value over the interval of definition did the simplest integration scheme analyzed (the pseudo-continuous method) coincide with the well known integration procedure of dividing the Fourier Transform of the record by i omega. Records with non-zero mean, on the other hand, required additional terms to achieve consistency with time domain procedures such as the trapezoidal rule. The formulae developed were applied to the Golden Gate Earthquake of March 22, 1957, and compared against each other. GRA

THE INTERNAL REFRACTIVE INDEX SPECTRA OF CLOUDS FROM FORWARD SCATTER RADAR OBSERVATIONS

best copy available

Earl E. Gossard and Richard G. Strauch. Jun. 1979. 39 p. refs.
(PB80-107238; NOAA-TR-ERL-WPL-44) Avail: NTIS
HC A03/MF A01 CSCL 04A

There are occasions when radar return from a volume of cloud is unexpectedly large if it is presumed to be caused by the classical mechanism of incoherent scatter from individual cloud droplets. Such a mechanism predicts the scattered power to be proportional to the inverse 4th power of the wavelength. The observed weaker wavelength dependence could result from Bragg-coherent scatter from the ensemble of droplets or it could result from an enhancement by the cloud of inhomogeneities in the dielectric constant of the gaseous medium within the cloud. Both mechanisms are discussed and compared with data acquired in a forward scatter mode by the WPL 3 cm radar system. Observed differences between the in-cloud and out-of-cloud refraction index spectra are discussed. GRA

MONTH AND YEAR AHEAD FORECASTING OF MONTHLY PRECIPITATION FOR THE SOUTHEASTERN UNITED STATES Ph.D. Thesis
William John March 1979 245 p
Avail: Univ. Microfilms Order No. 8002151

Four different statistical techniques were used to develop six models for forecasting monthly precipitation for the southeastern United States. The six models are a Box-Jenkins autoregressive integrated moving-average (ARIMA) model (BJALL), two non-integer harmonic models (NIALL and NIMO), a multiple linear regression model (REGALL) and two models resulting from the combination of forecasts from BJALL and NIALL (COMB2) and from BJALL, NIALL and REGALL (COMBALL). All models were poor predictors of the absolute quantity of precipitation, but they showed some success in forecasting categorical quantity. Overall, REGALL showed better results in forecasting the 1970-1977 years than the other models. Dissert. Abstr.

N80-16671 Colorado State Univ., Fort Collins.
DYNAMICS OF EQUATORIAL MASS-FLOW ADJUSTMENT Ph.D. Thesis
Pedro Leite SilvaDias 1979 217 p
Avail: Univ. Microfilms Order No. 7928547

The problem of the adjustment of the mass and wind fields in a divergent barotropic model was solved on the equatorial beta plane. Contrary to the traditional f plane analysis, the motion does not tend to a perfect geostrophic balance on a short time scale. The beta plane approximation allows for the presence of Rossby waves and since these waves are quasigeostrophic, they may be regarded as the adjusted state. It is also shown that the concept of an adjusted state on the beta plane is dependent on the dispersive properties and energetics of Rossby and gravity waves. Other results are reported. Dissert. Abstr.

N80-16672 Colorado State Univ., Fort Collins.
LINEAR SPECTRAL MODEL OF TROPICAL MESOSCALE SYSTEMS Ph.D. Thesis
Maria Assuncao Faus SilvaDias 1979 232 p
Avail: Univ. Microfilms Order No. 7928546

The sensitivity of mesoscale features with respect to large scale tropical profiles of wind and temperature and to small scale parameterizations was investigated through a linear, spectral, nonhydrostatic model. The cumulus heating parameterization was the so called Wave-CISK parameterization, defined by an idealized moisture budget. It is found that the growth rates of different scales of motion are very sensitive to small scale parameters, such as top of moist layer, mean mixing ratio in moist layer, and level of maximum heating rate. The speed of propagation and the mode of maximum growth rate are not very sensitive to small scale parameterization. Other significant results are reported. Dissert. Abstr.

N80-16673 California Univ., Los Angeles.
NUMERICAL SIMULATION OF THE FORMATION AND DISSIPATION OF STRATUS CLOUD UNDER AN INVERSION Ph.D. Thesis
Fanthune John Moeng 1979 234 p
Avail: Univ. Microfilms Order No. 8001388

Steady-state and transient processes involved in stratus cloud under a sub tropical inversion are examined. A numerical model is developed permitting extensive sensitivity and parameter variation studies. The model includes the following properties: (1) one dimensional, transient; (2) first order closure in turbulent transfer terms; (3) solar radiative transfer; (4) thermal radiation transfer in cloud; (5) soil and sea surface temperature. Field data are simulated by the model and it is determined what input parameterizations (advection and divergence) produce optimal results. Finally, through systematic parameter variation the model shows stratus formation and dissipation to be sensitive to all input parameters within their normal ranges of values. Dissert. Abstr.

N80-16674 Stanford Univ., Calif.
RAPID-SCANNING MEASUREMENTS OF WIND-PRODUCED DOPPLER ON AN ASYMMETRICAL MICROWAVE TRANSHORIZON PROPAGATION PATH Ph.D. Thesis
Ronald Douglas Fleming 1979 131 p
Avail: Univ. Microfilms Order No. 8001917

A rapid data-gathering system is used to remotely probe the wind-field velocity structure in the common volume region of a 164-km transhorizon propagation path. Wind-produced Doppler shifts resulting from average transverse velocities up to about 5 m/s were measured and found consistent both in magnitude and direction with the prevailing winds observed in the lower strata of the common volume region. On numerous occasions Doppler measurement results reflected much higher average velocities (up to 40 m/s) than could be attributed to normal low altitude winds. Time-spatial analyses of these anomalous spectra are indicative of aircraft induced atmospheric disturbances. The spectral signatures of these disturbances may provide additional insight into the generation and decay of aircraft trailing vortices. Dissert. Abstr.

THUNDERSTORM-ENVIRONMENT INTERACTIONS DETERMINED WITH THREE-DIMENSIONAL TRAJECTORIES
Gregory Sims Wilson Washington Jan. 1980 163 p refs
(NASA-RP-1054) Avail: NTIS HC A08/MF A01 CSCL 04B

Diagnostically determined three dimensional trajectories were used to reveal some of the scale interaction processes that occur between convective storms and their environment. Data from NASA's fourth Atmospheric Variability Experiment are analyzed. Two intense squall lines and numerous reports of severe weather occurred during the period. Convective storm systems with good temporal and spatial continuity are shown to be related to the development and movement of short wave circulation systems aloft that propagate eastward within a zonal mid tropospheric wind pattern. These short wave systems are found to produce the potential instability and dynamic triggering needed for thunderstorm formation. The environmental flow patterns, relative to convective storm systems, are shown to produce large upward air parcel movements in excess of 50 mb/3h in the immediate vicinity of the storms. The air undergoing strong lifting originates as potentially unstable low level air traveling into the storm environment from southern and southwestern directions. The thermo and hydrodynamical processes that lead to changes in atmospheric structure before, during, and after convective storm formation are described using total time derivatives of pressure or net vertical displacement, potential temperature, and vector wind calculated by following air parcels. THE ROLE OF SATELLITE ALTIMETRY IN CLIMATE STUDIES
C. L. Parsons Washington Jan. 1980 32 p refs
(NASA-TP-1570) Avail: NTIS HC A03/MF A01 CSCL 04B

The results of three generations of satellite-borne radar

altimetry experiments are summarized. The diverse measurements possible from this instrument are shown to be directly applicable to studies of the importance of the oceans in climate. The radar altimeter has unique value for investigations seeking knowledge of the interconnections between ocean dynamics, heat and momentum transfer across the air-sea interface, sea ice extent, and polar ice sheet thickness. A THUNDERSTORM GUST FRONT DETECTION SYSTEM. PART 1: SYSTEM OPERATION AND SIGNIFICANT CASE STUDIES. PART 2: STATISTICAL RESULTS. Summary Report, Oct. 1976 - Apr. 1979
A. J. Bedard, Jr., F. H. Merrem, D. Simms, and M. M. Cairns. Aug. 1979. 146 p. refs.
(Contract DOT-FA76-WAI-622)
(AD-A075922; FAA-RD-79-55-Pt-2) Avail: NTIS HC A07/MF A01 CSCL 01/5

The data presented demonstrate the importance of stable surface layers in determining how well surface temperature and wind measurements represent flow at higher levels and explain underestimates of system severity. The wind and pressure sensors combine to provide a total system offering good reliability for detection of thunderstorm outflows. An array configuration (composed of wind and pressure pump sensors) are recommended for use in airport warning systems. This configuration extending about 10 km from the airport provides a warning for thunderstorm gust-fronts. The data set offers wide possibilities for further exploitation including case study comparisons with numerical models, case study comparisons with weather radar data, and summaries of shear data and Doppler sounder profiles for use by those computing aircraft response and those designing remote sensing systems. A COMPARISON OF GLAS SAT AND NMC HIGH RESOLUTION NOSAT FORECASTS FROM 19 AND 11 FEBRUARY 1976
Robert Atlas. Nov. 1979. 19 p. refs.
(NASA-TM-80591) Avail: NTIS HC A02/MF A01 CSCL 04B

A subjective comparison of the Goddard Laboratory for Atmospheric Sciences (GLAS) and the National Meteorological Center (NMC) high resolution model forecasts is presented. Two cases where NMC's operational model in 1976 had serious difficulties in forecasting for the United States were examined. For each of the cases, the GLAS model forecasts from initial conditions which included satellite sounding data were compared directly to the NMC higher resolution model forecasts, from initial conditions which excluded the satellite data. The comparison showed that the GLAS satellite forecasts significantly improved upon the current NMC operational model's predictions in both cases. R.E.S.

THE WEATHER IN 1978 [LE TEMPS EN 1978]
R. Sneyers. 1979. 53 p. In FRENCH
Avail: NTIS HC A04/MF A01

The general atmospheric situation in Belgium was marked by the predominance of a depression regime from the middle of winter until the middle of summer. This predominance was followed by an anticyclonic regime which lasted until the end of the year. The persistent return of the anticyclonic regime from the middle of summer and the resulting rain deficit, the winter hygrometric deficit, and the mediocre thermal conditions from the middle of summer until the beginning of autumn are considered the most salient facts about Belgian weather in 1978. Variations in wind, air temperature, humidity, and precipitations are discussed for each month. Transl. by A.R.H.

RESULTS OF THE AUGUST 1977 SOVIET AND AMERICAN METEROLOGICAL ROCKETSONDE INTERCOMPARISON HELD AT WALLOPS ISLAND, VIRGINIA
Francis J. Schmidlin, Joseph R. Duke, Andre I. Ivanovsky, and Y. M. Chernyshenko. Feb. 1980. 193 p. refs. Prepared in cooperation with the Hydrometeorological Service of the USSR.
(NASA-RP-1053) Avail: NTIS HC A09/MF A01 CSCL 04B

A coordinated program of rocketsonde investigations along about 60 deg E and 70 deg W between the United States and U.S.S.R. is discussed. The rocketsonde instruments used by the U.S. and U.S.S.R. were compared and the results are presented. The U.S. Super Loki Datasonde and the U.S.S.R. M100B rocketsonde are discussed. Results indicate that the U.S/U.S.S.R. rocketsonde measurement agreement improved since the 1973 intercomparisons. It was learned that the mean of the differences of the temperatures compare to within 6 C at about 60 km and to within 2 C near 50 km. Wind measurements were also found to agree. A.W.H.

AVE-SESAME 1: 25-MB SOUNDING DATA
Myron L. Gerhard (Texas A and M Univ., College Station), Henry E. Fuelberg (St. Louis Univ., Missouri), Steven F. Williams (Texas A and M Univ., College Station), and Robert E. Turner. Dec. 1979. 365 p.
(NASA-TM-78256) Avail: NTIS HC A16/MF A01 CSCL 04B

Seven atmospheric variability experiments (AVE), two atmospheric variability and severe storms experiments (AVSSE), and six atmospheric variability experiment-severe environmental storm and mesoscale experiments (AVE-SESAME) conducted by NASA are discussed. The dates, observation times, and data reports for each of the experiments for which data was processed are listed. The AVE experiments were conducted primarily to study atmospheric variability with emphasis on spatial and temporal in atmospheric structure that can be detected from soundings taken at 3 hr intervals but not seen in soundings taken at 12 hr intervals. The AVSSE experiments were conducted to study atmospheric structure and variability associated with severe storms combining both rawinsonde and aircraft data to provide information on near storm environments. The method of processing is discussed, estimates of the rms errors in the data are presented, an example of contact data is given, and soundings are listed which exhibited abnormal characteristics. The need for improved methods of forecasting climate variations is considered. The stochastic dynamic forecast method is proposed as one way of improving forecast skill. It is shown that model forecasts of space-time averaged quantities have much smaller errors than forecasts of quantities at a particular time

and place. These errors are small enough that use of stochastic techniques can reduce forecast errors still further. DOE

SIMPLIFIED PROCEDURE FOR CALCULATING THE EFFECTS OF DAYLIGHT FROM CLEAR SKIES
H. J. Bryan. Sep. 1979. 33 p. refs. Presented at the Ann. Illuminating Eng. Soc. Tech. Conf., Atlantic City, N.J., 16-20 Sep. 1979.
(Contract W-7405-eng-48)
(LBL-9048; CONF-790916-2; EEB-W-79-08) Avail: NTIS HC A03/MF A01

A simplified procedure for calculating daylight illumination at any point within a room under clear sky conditions is described which is consistent with the CIE recommended daylight factor method. The calculation procedure used here separates the light reaching the point being considered into three components: light directly from the sky and light after reflection from external and internal surfaces. Graphs and tables are developed for these components in order to evolve a calculation procedure which is simple to apply rather than lengthy direct computation from first principles. A validation case study is presented in order to demonstrate the accuracy of the proposed calculation procedure. DOE

A STEADY THERMOHALINE CONVECTION MODEL (DRIVEN BY TURBULENT BUOYANT PLUMES FROM MULTIPLE ISOLATED SOURCES IN A LARGE NONTURBULENT FINITE REGION, WITH APPLICATIONS TO THE OCEANIC THERMOHALINE CIRCULATION) Ph.D. Thesis
William Horatio Peterson. 1979. 180 p.
Avail: Univ. Microfilms. Order No. 8001679

A two dimensional steady convection model driven by an isolated turbulent buoyant plume in a finite region is developed and extended to include multiple plumes. When the plumes are taken to be inclined wall plumes, the added effects of wall drag and slope are investigated and shown not to effect the qualitative behavior of the model. The model developed suggests behavior qualitatively different from that of previous thermohaline circulation models. The two most important results are: (1) that the interior vertical velocity is small in the thermohaline and increases with depth; and (2) the inclusion of multiple deep water sources and the phenomenon of plume termination with the attendant implications of the terminating plume becoming a mid-depth source. Dissert. Abstr.

N80-16699 South Carolina Univ., Columbia.
A SIMULATION MODEL OF ESTUARINE SUBSYSTEM COUPLING AND CARBON EXCHANGE WITH THE SEA Ph.D. Thesis
James Kevin Summers. 1979. 341 p.
Avail: Univ. Microfilms. Order No. 8002279

A CSMP-III systems model was constructed describing the interactions of the salt marsh, oyster reef, water column, and subtidal benthos subsystems and their relationship to the environmental forcing functions of insolation, water temperature, tidal remixing, sea level, the areal contribution of each subsystem, and offshore concentrations of particulate organic matter (POM) and dissolved organic matter (DOM). Initial simulations indicate that the model output is stable and reproduces some of the major trends of a salt marsh ecosystem. The results of experimental studies suggest that annual variations in sea level resulting in variable tidal coverage of the salt marsh, offshore concentrations of POM and DOM, and the ratio of the surface areas of the marsh and water column subsystems all play important roles in the control of the exchange processes. In addition, the role of tidal remixing is particularly important in the control of annual DOM exchange between the estuary and the sea. Dissert. Abstr.

THE ENHANCED NODAL EQUILIBRIUM OCEAN TIDE AND POLAR MOTION
Braulio V. Sanchez. Nov. 1979. 23 p. refs. Submitted for publication.
(NASA-TM-80592) Avail: NTIS HC A02/MF A01 CSCL 08C

The tidal response of the ocean to long period forcing functions was investigated. The results indicate the possibility of excitation of a wobble component with the amplitude and frequency indicated by the data. An enhancement function for the equilibrium tide was postulated in the form of an expansion in zonal harmonics and the coefficients of such an expansion were estimated so as to obtain polar motion components of the required magnitude. R.E.S.

AN ASSESSMENT OF THE EFFECTS OF BATHYMETRIC CHANGES ASSOCIATED WITH SAND AND GRAVEL MINING ON TIDAL CIRCULATION IN THE LOWER BAY OF NEW YORK HARBOR
Kuo-Chuin Wong and R. E. Wilson. Jan. 1979. 31 p. refs.
(PB80-106487; SR-18; REF-79-1; NOAA-79091303) Avail: NTIS HC A03/MF A01 CSCL 08C

Tidal circulation patterns and tidal elevations in the lower bay of the New York harbor were numerically simulated for a number of altered bathymetries corresponding to hypothetical mining operations. Results suggest that tidal currents will decelerate over the mined region and accelerate outside of them, and that the tidal stream will be deflected towards the region. It is also clear that the mining near the mouth of the bay could increase tidal range along Staten Island substantially. GRA

COASTAL UPWELLING ECOSYSTEMS ANALYSIS: RESPIRATION AND RESPIRATORY ELECTRON TRANSPORT ACTIVITY IN PLANKTON FROM THE NORTHWEST AFRICAN UPWELLING AREA
T. T. Packard. Jan. 1979. 79 p. refs.
(PB-301029/5; NSF/IDOE-79/55; NSF/IDOE/CUEA-TR-47)
Avail: NTIS HC A05/MF A01 CSCL 08C

Microplankton and zooplankton respiration were calculated from ETS activity measurements in the upwelled waters off Cape Blanc, Mauritania. Respiration-photosynthesis ratios were calculated from two different assessments of gross productivity. Correlations support the assumption that phytoplankton metabolism. The role of the zooplankton in the regeneration of ammonium in the euphotic zone was investigated by calculating an ammonium excretion rate from zooplankton respiration and comparing this to phytoplankton NH_4 uptake rates. The hypothesis that the large difference in productivity between the Peru Current and the N.W. African upwelling systems is explained by the differences in the ratio of the compensation depth to the mixed layer depth was tested. GRA

COASTAL UPWELLING ECOSYSTEMS ANALYSIS. INTERACTIONS OF PRIMARY NUTRIENT AND CARBON UPTAKE IN THE PERU CURRENT: A REVIEW AND SYNTHESIS OF LABORATORY AND FIELD RESULTS
R. C. Dugdale, B. H. Jones, Jr., J. J. MacIsaac, and J. J. Goering. Feb. 1979. 60 p. refs. Prepared in cooperation with Alaska Univ., College.
(Grant NSF OCE-77-27006)
(PB-301031/1; NSF/IDOE-79/54; NSF/IDOE/CUEA/TR-51) Avail: NTIS HC A04/MF A01 CSCL 08C

The elaboration of a model linking nutrient-limited uptake of primary nutrient and photosynthetic processes is presented. The model of nutrient-limited growth described by Dugdale (1977) was expanded to include multiple-nutrient uptake. The resulting model expands the theoretical basis for the planning and interpretation of observations of primary production and nutrient processes in eutrophic regions of the sea such as the Peruvian upwelling system. OBSERVATIONS OF TEMPERATURE, CURRENT, AND WIND VARIATIONS OFF THE CENTRAL EASTERN COAST OF FLORIDA DURING 1970 AND 1971
Thomas D. Leming. Aug. 1979. 189 p. refs.
(PB-301280/4; NOAA-TM-NMFS-SEFC-6; NMFS/SEFC-6; NOAA-79083001) Avail: NTIS HC A09/MF A01 CSCL 08C

Results of an approximately monthly series of XBT transects during 1971 near Cape Canaveral revealed a pronounced seasonal difference in thermal structure over the continental shelf. The

coastal waters were strongly vertically in winter. This was interpreted as due to increased strength and onshore movement of the Florida Current during the summer months, which was accompanied by intrusion of cold water along the bottom onto the shelf. Following offshore retreat of the Florida Current, cold water lenses 80 km long, 10 km wide, and 5 m thick remained over the bottom in the mid-shelf zone. GRA

THE DISTRIBUTION AND SEASONALITY OF THE BENTHIC AQUATIC MACROPHYTES OF THE PAMLICO RIVER ESTUARY, NORTH CAROLINA M.S. Thesis
Steven E. Reed Jan. 1979 67 p refs
(Contract DI-14-31-0001-5033)
(PB-300496/7; W79-09834; OWRT-A-077-NC(11)) Avail: NTIS HC A04/MF A01 CSCL 08A

The distribution and seasonal dynamics of the submersed vascular plants and macroscopic algae of the Pamlico River estuary, North Carolina, were studied. Plants were restricted mainly to the sandy shallow margins in the upper two thirds of the estuary with most of the biomass around 1 m depth. The estuary was divided into oligo-, meso- and polyhaline zones based on a rather unstable salinity gradient. In the oligohaline zone macrophyte communities consisted of Vallisneria americana, Potamogeton perfoliatus, Najas guadalupensis, and the muskgrasses Chara sp. and Nitella sp.; the mesohaline zone included V. americana, P. perfoliatus and Ruppia maritima. Line transects were used to sample biomass and community species composition during the seasonal studies. GRA

POLEWARD HEAT FLUX AND CONVERSION OF AVAILABLE POTENTIAL ENERGY IN DRAKE PASSAGE
Harry L. Bryden 1979 24 p refs Repr. from J. Marine Res., v. 37, no. 1 p 1-22
(Grant NSF OCE-77-22887)
(PB-301311/7; WHOI-CONTRIB-4099; NSF/IDOE-79/76) Avail: NTIS HC A02/MF A01 CSCL 08J

Energetic fluctuations that transport heat poleward in the Drake Passage are studied. The rate of conversion is found to be approximately equal to the rate at which wind puts energy into the water column. Comparison is made with the baroclinic instability model which predicts conversion of available potential energy. The vertical phase function proved difficult to observe. The signature of the instability process is that temperature and poleward velocity are nearly in phase. A 90 degree phase difference between poleward and eastward velocity components and a dominance of energy in the counterclockwise half of the rotary spectrum are associated with this signature. GRA

METHOD AND APPARATUS FOR ELIMINATING LUMINOL INTERFERENCE MATERIAL Patent
Eldon L. Jeffers (Boeing Aerospace Co., Houston, Tex.) and Richard R. Thomas, inventors (to NASA) (Boeing Aerospace Co., Houston, Tex.) Issued 27 Nov. 1979 10 p Filed 9 Feb. 1978 Supersedes N78-18674 (16 - 09, p 1197) Sponsored by NASA
(NASA-Case-MSC-16260-1; US-Patent-4,176,007; US-Patent-Appl-SN-876440; US-Patent-Class-435-34; US-Patent-Class-422-52; US-Patent-Class-23-927) Avail: US Patent and Trademark Office CSCL 06A

A method and apparatus for removing porphyrins from a fluid sample which are unrelated to the number of bacteria present in the sample and prior to combining the sample with luminol reagent to produce a light reaction is disclosed. The method involves a pre-incubation of the sample with a dilute concentration of hydrogen peroxide which inactivates the interfering soluble porphyrins. Further, by delaying taking a light measurement for a predetermined time period after combining the hydrogen peroxide-treated water sample with a luminol reagent, the luminescence produced by the reaction of the luminol reagent with ions present in the solution, being short lived, will have died out so that only porphyrins within the bacteria which have been released by rupturing the cells with the sodium hydroxide in the luminol reagent, will be measured. The measurement thus obtained can then be related to the concentration of live and dead bacteria in the fluid sample.

FACTORS INFLUENCING SPECIFIC GROWTH RATES AND SEASONAL ABUNDANCE OF EUTROPHIC LAKE PHYTOPLANKTON Ph.D. Thesis
Gary Frank Marx 1979 94 p
Avail: Univ. Microfilms Order No. 8001561

The seasonal succession of dominant phytoplankton populations and the daily concentrations of major nutrients in a central Michigan waste treatment basin were monitored over the 1977 growing season in order to study the factors controlling the growth of the various species. Carbon and light attenuation due to large algal standing crops, as well as the availability of dissolved organic substances, seemed to be the major factors controlling annual algal productivity. While a simple, kinetics based model was not be able to accurately predict the weekly specific growth

rates of the various species, predictions of approximate periods of growth were quite accurate, making such a model of considerable value for practical use. Dissert. Abstr.

THEORETICAL STUDIES OF THE LIGHT REACTIONS IN PHOTOSYNTHESIS Ph.D. Thesis
Richard Adam Friesner 1979 193 p
Avail: Univ. Microfilms Order No. 8000347

Using magnetic resonance formalism and theoretical formulations to interpret electron paramagnetic resonance (EPR) spectra the light reactions of photosynthesis were studied. A general method of determining the orientational distribution function of a partially ordered ensemble of paramagnetic systems from its EPR lineshape is presented. A radical pair theory of spin polarization for systems of membrane bound radicals with anisotropic g tensors is developed, and used to explain the orientation dependence of the lineshape of the polarized signal. The electron transport cofactors involved in the photosynthetic light reactions in both green plants and photosynthetic bacteria are identified. Dissert. Abstr.

GLUCOSE METABOLISM IN DIFFERENT REGIONS OF THE RAT BRAIN UNDER HYPOKINETIC STRESS INFLUENCE
K. Konitzer (Acad. of Sci. of the Ger. Democratic Republic) and S. Voigt (Acad. of Sci. of the Ger. Democratic Republic) Jan. 1980 15 p refs Transl. into ENGLISH from Acta Biol. Med. Ger. (East Germany), v. 35, 1976 p 853-866 Transl. by Kanner (Leo) Associates, Redwood City, California
(NASA-TM-75949) Avail: NTIS HC A02/MF A01 CSCL 06C

Glucose metabolism in rats kept under long term hypokinetic stress was studied in 7 brain regions. Determination was made of the regional levels of glucose, lactate, glutamate, glutamine, aspartate, gamma-aminobutyrate and the incorporation of C-14 from plasma glucose into these metabolites, in glycogen and protein. From the content and activity data the regional glucose flux was approximated quantitatively. Under normal conditions the activity gradient cortex and frontal pole cerebellum, thalamus and mesencephalon, hypothalamus and pons and medulla is identical with that of the regional blood supply (measured with I131 serum albumin as the blood marker). Within the first days of immobilization a functional hypoxia occurred in all brain regions and the utilization of cycle amino acids for protein synthesis was strongly diminished. After the first week of stress the capillary volumes of all regions increased, aerobic glucose metabolism was enhanced (factors 1.3 - 2.0) and the incorporation of glucose C-14 via cycle amino acids into protein was considerably potentiated. The metabolic parameters normalized between the 7th and 11th week of stress. Blood supply and metabolic rate increased most in the hypothalamus. R.C.T.

MORPHOLOGICAL AND FUNCTIONAL MANIFESTATIONS OF RAT ADRENAL-CORTEX RESPONSE TO SODIUM BROMIDE ADMINISTRATION UNDER HYPODYNAMIC STRESS
L. T. Kirichek (Kharkov Med. Inst.) and V. I. Zholudeva (Kharkov Med. Inst.) Nov. 1979 12 p refs Transl. into ENGLISH from Farmakol. Toksikol. (USSR), v. 38, no. 6, Nov. - Dec. 1975 p 703-706 Transl. by Scientific Translation Service, Santa Barbara, Calif.
(Contract NASw-3198)
(NASA-TM-7593) Avail: NTIS HC A02/MF A01 CSCL 05C

Functional and morphological manifestations of adrenal cortex response to hypodynamia (2-hr immobilization on an operating table) under the influence of bromine preparations were studied. The sodium bromide was administered intraperitoneally in 100, 250, and 500 mg/kg doses once and repeatedly during ten days. The adrenal gland was evaluated functionally by ascorbic acid and cholesterol content and morphologically by coloring it with hematoxylin-eosin and Sudans for lipid revealing at freezing. Results are displayed in two tables and microphotographs. They are summarized as follows: the bromine weakens the functional state of the adrenal cortex in intact rats, causing changes similar to those under stress. During immobilization combined with preliminary bromine administration, a less pronounced stress reaction is noticeable. R.C.T.

CATECHOLAMINES AND MYOCARDIAL CONTRACTILE FUNCTION DURING HYPODYNAMIA AND WITH AN ALTERED THYROID HORMONE BALANCE
G. M. Pruss, V. I. Kuznetsov, and A. A. Zhilinskaya Jan. 1980 17 p refs Transl. into ENGLISH from Izv. Akad. Nauk SSSR, Ser. Biolhk. (USSR), no. 2, 1975, p 187-195 Original language document previously announced as A75-32600 Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prep. by Vitebsk State Medical Inst. (USSR)
(Contract NASw-3199)
(NASA-TM-76000) Avail: NTIS HC A02/MF A01 CSCL 06C

The dynamics of catecholamine content and myocardial contractile function during hypodynamia were studied in 109 white rats whose motor activity was severely restricted for up to 30 days. During the first five days myocardial catecholamine content, contractile function, and physical load tolerance decreased. Small doses of thyroidin counteracted this tendency. After 15 days, noradrenalin content and other indices approached normal levels and, after 30 days, were the same as control levels, although cardiac functional reserve was decreased. Thyroidin administration after 15 days had no noticeable effect. A detailed table shows changes in 17 indices of myocardial contractile function during hypodynamia. K.L.

INFLUENCE OF X IRRADIATION AND DIET ON PITUITARY/THYROID FUNCTION IN THE RAT M.S. Thesis
I. G. Qassar 1979 59 p refs
(Contract EY-76-C-02-3490)
(UR-3490-1674) Avail: NTIS HC A04/MF A01

Rats were maintained on low iodine diet or treated with T sub 4. A significant increase in thyroid weight was observed in rats on low iodine diet whereas among rats on normal diet with thyroxine injections, the thyroid was lower in weight than thyroids of control animals. Pituitary weight increased significantly in rats on low iodine diet or T sub 4 treatment. Where PTU was administered to rats pretreated with either normal diet, normal diet plus T sub 4, or maintained on low iodine diet and then exposed to radiation (100 to 400R) to the neck, it was not possible to distinguish the effect of such local radiation on body growth. Contrary to low iodine treatment, administration of PTU did not result in any increase in pituitary weight in rats maintained on normal diet prior to radiation or in rats maintained on low iodine diet prior to radiation. There was, however, a significant increase in pituitary weight in rats injected with thyroxine prior to radiation (250R or 400R). DOE

ANAEROBIC BIOLOGICAL TREATMENT OF LIQUID WASTES FROM PYROLYSIS PROCESSES Progress Report, 1 Apr. 1977 - 31 Mar. 1979
R. R. Dague 15 May 1979 61 p

(Contract EC-77-S-02-4455)
(COO-4455-2) Avail: NTIS HC A04/MF A01

Experimental work has shown that gas scrubber wastes from the pyrolysis process are high in organics that are toxic to anaerobic biological treatment systems. Carbon was evaluated as a method of pretreatment, co-treatment, or separate treatment for application to the pyrolysis wastes. Experiments with carbon adsorption indicates that wastes can be adsorbed to a high degree. Isotherms indicate an adsorptive capacity of between 0.60 and 0.86 grams of COD per gram of carbon. Suspended growth systems are also discussed. DOE

(NASw-3199)
(NASA-TM-75515) Avail: NTIS HC A02/MF A01 CSCL 06P

With the use of a thermocouple and mirror galvanometer, calibrated before the experiment and after each test, it was found that the normal temperature in the esophagus is 0.1-0.4 C higher than in the oral cavity, the temperature in the duodenum is somewhat less than in the stomach, but higher with cholecystitis, duodenitis or gastritis, the temperature in the normal stomach equals or is somewhat higher than in the esophagus, and that the temperature of distended stomachs frequently is lower than in the esophagus. It was found that hot water is retained in the stomach longer than cold water, and that both hot and cold water are allowed to pass into the duodenum when the water temperature becomes approximately equal to that of the surrounding organs. BIOLOGICAL EFFECTS OF HIGH-VOLTAGE ELECTRIC FIELDS. VOLUME 1: AN UPDATE Final Report
Jul. 1979 224 p. refs.
(EPRI Proj. 857-1)
(EPRI-EA-1123) Avail: NTIS HC A10/MF A01

Literature which has become available since mid-1974 on the subject of biological effects of power frequency electric fields was reviewed. Some 2000 new entries of both publications and research programs in progress were identified through a computer-aided literature search. Approximately 50 of these

entries are discussed. The general findings of this update confirm the conclusion that it is highly improbable that electric fields from transmission lines have any significant biological effects on healthy individuals who encounter such fields in a normal way under ordinary conditions. However, further research is still needed in order to understand the nature and extent of any effects that could be harmful. DOE

(PB-299739/3; NIH-N01-HV-8-2921-1) Avail: NTIS HC A04/MF A01 CSCL 06B

The initial development of a percutaneous access device is presented. Selected materials were tested for their ability to support cell growth and nutrients were examined for optimizing cell growth and collagen production. To protect the tissue-implant seal from mechanical stresses, alternative surgical techniques were employed to implant a subcutaneous flange. After implanting a flange in a Yucatan miniature pig, forces were applied to the tissue-implant composite. Strain data indicate (1) good fibrotic bonding occurs between the tissue and the implant, and (2) stabilization of the flange with respect to the adjacent dermis. GRA

The JCGS thermal energy converter program objective is to develop clinically useful permanently implantable Stirling/hydraulic power sources to operate heart-assist or full-heart replacement blood pumps. The energy source is heat from an electric heater or from a radioisotope which could provide complete system implantability. Development has progressed through seven system configurations. Stirling Engine 5 has accumulated 6.3 years of operating time and has demonstrated 4.1 years of maintenance-free operation before failure. The short-stroke pump actuator/controller on accelerated life test has demonstrated 6.6 equivalent years of maintenance-free life without failure and accumulated a total of 16.5 equivalent years of operation. System 5 in-vivo test demonstrated circulation of all systemic blood flow throughout 175-hour test. System 6 complete power source demonstrated 15.5 percent efficiency, 1.2 liter volume, and 2.4 kg weight. System 7 engine module has demonstrated 20.1 percent efficiency with 0.2 liter volume and 0.7 kg weight. GRA

(AD-A075946; FAA-RD-79-74; FAA-NA-79-19) Avail: NTIS HC A03/MF A01 CSCL 05/10

Pilot response delays to collision avoidance commands displayed in the cockpit of a General Aviation Trainer simulator were analyzed. For fixed geometries, velocities, and aircraft response rates, the separation at the point of closest approach between aircraft responsing to collision avoidance system (CAS) commands, is inversely related to the length of pilot delay in responding to the CAS command. The Gamma distribution was the best distribution for approximating the empirical data in terms of minimum error mean square, lack of bias, and uniformity of fit. K.L.

A STUDY OF OCCUPATIONAL HEAT STRESS BY ANALYSIS OF ENVIRONMENTAL AND HUMAN FACTORS. Ph.D. Thesis
David Jefferson Calley. 1979. 289 p.
Avail: Univ. Microfilms Order No. 7927487

The environmental and physiological aspects related to workmen in a hot production process in the warm and humid Gulf Coast region of the United States are described. Heat stress and strain was investigated in terms of three heat stress indices, the heat stress index, the wet bulb globe temperature, and the wet globe temperature. Correlation coefficients between these indices are discussed. In addition, medical data and clinical chemistry of blood and urine among workmen with heat illness was investigated. Recommendations were made for prevention of heat illness and for the use of heat stress indices. Precautions were stated related to the work-rest ratios and the estimation and measurement of metabolism and allowable exposure times. Dissert. Abstr.

N80-16736 Ohio State Univ., Columbus.
PLANAR BIPED DYNAMICS AND CONTROL. Ph.D. Thesis
Andrew Zbigniew Ceranowicz. 1979. 196 p.
Avail: Univ. Microfilms Order No. 8001704

Linear feedback was used to control the motion of a mathematical biped model composed of five rigid links connected by ideal torque actuators at pin joints and constrained to move only in the sagittal plane. The equations of motion for the biped model and support equations, which describe the contact between the supporting surface and the feet of the biped, are presented. These equations can be solved simultaneously for the biped's accelerations and ground reaction forces once the dynamic state and control torques are known. For point feet and a hard flat horizontal support surface, there are nine possible sets of support equations, i.e., support phases. Finding the correct support phase for any control torques and dynamic state is discussed. These ideas were implemented in the simulation of walking which required the transition between three support phases. Dissert. Abstr.

MULTI-MODAL INFORMATION PROCESSING FOR VISUAL WORKLOAD RELIEF
Michael W. Burke, Richard D. Gilson, and Richard J. Jagacinski. 1980. 28 p. refs.
(Grant NsG-2179)
(NASA-CR-162720) Avail: NTIS HC A03/MF A01 CSCL 05H

The simultaneous performance of two single-dimensional compensatory tracking tasks, one with the left hand and one with the right hand, is discussed. The tracking performed with the left hand was considered the primary task and was performed with a visual display or a quickened kinesthetic-tactual (KT) display. The right-handed tracking was considered the secondary task and was carried out only with a visual display. Although the two primary task displays had afforded equivalent performance in a critical tracking task performed alone, in the dual-task situation the quickened KT primary display resulted in superior secondary visual task performance. Comparisons of various combinations of primary and secondary visual displays in integrated or separated formats indicate that the superiority of the quickened KT display is not simply due to the elimination of visual scanning. Additional testing indicated that quickening per se also is not the immediate cause of the observed KT superiority. R.E.S.

(PB80-101546; MRC-DA-892; AR-1) Avail: NTIS HC A03/MF A01 CSCL 06L

Fatigue life comparisons of candidate elastomers for use in the artificial heart were made under various conditions. These include: (1) cyclical, progressively increasing, uniaxial strain in air, saline, and in-vitro blood media; (2) progressive uniaxial strain in the same media, with prior cut-growth initiation of samples; and (3) cyclical, biaxial strain in an air environment, accelerated by introduction of various stress concentrators in the samples. Materials evaluated were NBS butyl rubber, Upjohn Pellethane, Goodyear Hexsyn, and Thoratec Biomer. The order of ranking of fatigue lifetime was not the same for the tests cited, and the mode of failure differed for filled (butyl rubber, Hexsyn) and unfilled elastomers. GRA

EVALUATION OF COMMERCIALLY AVAILABLE LASER PROTECTIVE EYEWEAR Final Report
Kenneth R. Envall and Ross Murray, Jr. (Laser Effects Branch, USAF School of Aerospace Medicine). May 1979. 102 p. refs. Prepared in cooperation with USAF School of Aerospace Medicine, Brooks AFB, Tex.
(PB80-103039; DHEW/PUB/FDA-79/8086; FDA/BRH-79/110) Avail: NTIS HC A06/MF A01 CSCL 06Q

Forty commercially available laser protective eyewear materials and ten representative frames were evaluated under non-stress and stress conditions. Parameters such as optical density, spectral transmission, luminous transmittance, refractive and prismatic effects haze, and impact resistance were determined and, where possible, compared to recommended criteria for occupational eye and face protection. In addition, all materials were subjected to shelf-life, environmental, and laser-induced damage tests to determine damage limits and characteristics. GRA

WIZARD: A STRING-ORIENTED MICROPROCESSOR OPERATING SYSTEM Final Report, Oct. 1976 - Sep. 1978
Shelburne D. Wilson, M. Edward Womble, and Michael L. Tworek Aug. 1979 15 p refs
(AD-A074704; SAM-TR-79-14) Avail: NTIS HC A02/MF A01 CSCL 09/2

A string-oriented operating system for Intel-8080-based microcomputers is described. The system consists of a hierarchy of virtual machines. The lowest level virtual machines extend the instruction set of the 8080 to include additional 16-bit arithmetic and logical instructions, new data types, and operators. The data types include strings and string operators derived from the SNOBOL programming language. A table data type is constructed from strings, and table-manipulation operators are provided. A bit-map data type and associated operators are also included. An Input/Output Control System (IOCS) support device-independent IO to multiple devices and diskette files. File name aliases permit many logical IO streams to be dynamically mapped onto a restricted set of physical IO units. Pseudo device handlers expand the capabilities of IO devices and are transparent to application programs. Distributed command decoders interpret IO command strings. Once communication is established with a logical device, a low-overhead IO Vector mechanism may be used for further access. A keyboard monitor provides interactive debugging facilities to application programmers. System resource allocation is implementation dependent and is not embedded in the system nucleus. Multiple implementations over a range of system sizes have demonstrated the utility and adaptability of WIZARD. GRA

PERFORMANCE PREDICTION OF COMPUTER ARCHITECTURES OPERATING ON LINEAR MATHEMATICAL MODELS Ph.D. Thesis
L. A. Cox, Jr. 28 Sep. 1978 218 p refs
(Contract W-7405-eng-48)
(UCRL-52582) Avail: NTIS HC A10/MF A01

A limited theory of concurrent computations is developed for concurrent systems based on a requestor/server concept. By use of the Petri-Net concurrent control system model, it is shown that this theory is easily implemented and is capable of predicting the performance of scientific programs running on complex concurrent computer systems. The performance of this type of model is discussed in the light of the requirements for a computer architectural design tool. A number of examples are given to demonstrate the inherent correctness or accuracy. A large-scale computer system design example is presented where this model is used to predict performance. The questions of ease of use, efficiency, and accuracy are discussed, and the problems in the use of this type of approach for predicting performance of software-hardware ensembles are examined. DOE

TECHNOLOGY ASSESSMENT: ADP INSTALLATION PERFORMANCE MEASUREMENT AND REPORTING Final Report
Carol B. Wilson Sep. 1979 43 p refs
(PB80-101322; NBS-SP-500-53; LC-79-600154) Avail: NTIS HC A03/MF A01 CSCL 09B

The status of ADP installation performance measurement and reporting in the Federal ADP community is compared with the best practices as found in the Federal and private sectors and described in the literature. The comparison reveals that more effort could be expended by Federal sites in the area of computer performance management. The principal obstacles to more and better performance programs are perceived to be the lack of needed measures on many systems and the magnitude of the effort involved in accessing and analyzing the measures which are available. Recommendations whch could partially relieve the situation include: (1) development of standard performance measures; (2) development of a Government-wide data base for normative performance ranges; and (3) development of statistical computer performance evaluation techniques. FAST ALGORITHMS FOR NP-HARD PROBLEMS WHICH ARE OPTIMAL OR NEAR-OPTIMAL WITH PROBABILITY ONE Ph.D. Thesis
Routo Terada 1979 134 p
Avail: Univ. Microfilms Order No. 7924194

Fast algorithms for six NP-hard problems are present. Thesis algorithms are shown to be optimal or near optimal with probability one. An algorithm for the Euclidean traveling salesman problem in any k-dimensional Levesque set E of zero volume boundary was designed. FOr n points independently, uniformly distributed in E, it is shown that, in probability, the time taken by the algorithm is of order less than n delta (n), as n approaches infinity for any choice of an increasing function delta (however slow its rate of increase). The resulting solution will, with probability one, be asymptotic, as n approaches infinity, to the optimal solution. Dissert. Abstr.

AN APPROACH TO THE REQUIREMENTS ANALYSIS AND SPECIFICATION OF LARGE-SCALE SOFTWARE SYSTEMS Ph.D. Thesis
Hon Hing So 1979 294 p

Avail: Univ. Microfilms Order No. 8000520

A framework for systematic design and development of large-scale software systems is developed with a focus on the early phases of the process. A major hypothesis made is that in order to understand the design of large-scale software, it is necessary first to identify the major transitions in its development. A total software system model should contain submodels that are built upon concepts relevant to the corresponding levels. The coherence in the submodels is ascertained by a rigorous definition of the mapping involved in the transitions. For every element of the system model, consideration is given to the suitable analysis techniques for detecting anomalies and guiding further system development. Techniques investigated include the development of a system attribute hierarchy along with the functional decomposition. The techniques developed are applied to a case study. Dissert. Abstr.

N80-16758 Stanford Univ., Calif.
FORMALIZING THE ANALYSIS OF ALGORITHMS Ph.D. Thesis
Lyle Harold Ramshaw 1979 122 p
Avail: Univ. Microfilms Order No. 8001994

Using partial correctness techniques to allow assertions that describe the probabilistic state of the executing process to be written and manipulated, program verification was extended. A formal system (called the frequency system) is presented in which the arguments can be reduced to symbol manipulation. The use of the frequency system is discussed in several average case analyses. In the examples, symbol manipulation in the frequency system leads directly to the recurrence relation that describes the distribution of the chosen performance parameter. Dissert. Abstr.

N80-16759 California Univ., Los Angeles.
CONSTRUCTIVE EXTENSION AND IMPLEMENTATION OF ABSTRACT DATA TYPES AND ALGORITHMS Ph.D. Thesis
Farshid Nourani 1979 196 p
Avail: Univ. Microfilms Order No. 8001391

The questions of specification, extension, and implementation of abstract data types and algorithms are investigated. Some algebraic techniques for proving correctness of implementations are developed in which injective morphisms of algebras play an important role. Sufficient conditions are given for such morphisms to be injective. The techniques are based on a notion of constructor signature for canonical algebras. The approach is extended to implementations of abstractly specified algorithms through a new method which first does a recursive enrichment of the concrete specification and then imposes the structure of the abstract specification onto the initial algebra for the presentation of the concrete domain. Dissert. Abstr.

N80-16760 Carnegie-Mellon Univ., Pittsburgh, Pa.
THE REPRESENTATION OF FAMILIES OF SOFTWARE SYSTEMS Ph.D. Thesis
Lee Wendell Cooprider 1978 202 p
Avail: Univ. Microfilms Order No. 7925012

A notation is developed for describing the subsystem interconnections of entire systems, the differences between versions of those systems, and the mechanisms by which the systems are constructed. This representation is the basis for the design of a software construction data base. The data base manager automatically performs system construction steps, propagates modifications to system components, and maintains construction histories. The data base user establishes invariates in the data base by attaching policies to each data base object; the policies supply a set of actions to be performed when events in the data base affect the object. An extended sample is presented to demonstrate the applicability of the representation to a real system. Several types of system construction problems are discussed, and directions for improvements to the notation outlined. Dissert. Abstr.

N80-16761 Texas Univ. at Arlington.
COMPUTATIONAL METHODS OF SYSTEM IDENTIFICATION AND PARAMETER ESTIMATION Ph.D. Thesis
Wen-Hsiu Cheng 1979 186 p
Avail: Univ. Microfilms Order No. 8001658

A computational procedure is given and numerical examples are presented using both computer simulated data and experimental data to illustrate the performance of the Direct Computational Method as well as the general method of moments. Comparison of some identification methods is provided. Application to fluorescence decay analysis and, as a case study, modeling identification of an inner gimbal assembly telescope on an airborne pointing and tracking system are discussed in detail. Dissert. Abstr.

FACTORS AFFECTING COMPUTER PROGRAM COMPREHENSION Ph.D. Thesis
John Peter Boysen 1979 125 p
Avail: Univ. Microfilms Order No. 8000118

Factors affecting the comprehension of computer programs were studied. A pilot study was conducted in which subjects were asked to hand simulate expressions and small programs presented on a computer terminal. The reaction time to indicate the hand simulation results was used as a measure of the comprehensibility of the programs and expressions. The results of the pilot study indicated that, while the reaction time methodology was acceptable for studying simple expression, a different methodology was needed to study the comprehensibility of programs. Several refinement to the methodology were also suggested. Dissert. Abstr.

N80-16763 California Univ., Los Angeles.
ADAPTATION OF SET-DEFINING NOTATION TO THE SPECIFICATION OF FORMAL LANGUAGES Ph.D. Thesis
Arie Berman 1979 201 p
Avail: Univ. Microfilms Order No. 8001363

An adaptation of set-defining notation to the specification of recursively enumerable sets of strings is defined in order to bridge the gap between the nonprocedural set-defining capability of set-defining notation and the limitations of procedural computations. Equivalent interpretations of the system are given using a familiar version of Tarski's fixed point theorem and Ginsburg and Rice's definable sets, and their equivalence is proved. The involvement of string equations is formally described, and an equivalence between arbitrary string equations and a form of set expressions is shown. Restricted interpretations and syntactic restrictions of the proposed formal system are introduced and shown to assure the involvement of only unambiguous or proper string equations. The structural relation of the proposed system to post production systems is established, and any Turing machine computation is shown to be simulated by a search through its definition in the proposed system. Dissert. Abstr.

N80-16764 Ohio State Univ., Columbus.
SOFTWARE SCIENCE AND PROGRAM COMPLEXITY MEASURES Ph.D. Thesis
Albert Louis Baker 1979 276 p
Avail: Univ. Microfilms Order No. 8001686

A program complexity measure software effort is evaluated using the analytical methodology which relies on well defined program transformations. One type of transformation used embodies principles of program modularity. The behavior of E under modularizing tranformations is in agreement with accepted principles pertaining to such program changes. When E is evaluated in light of transformations related to program control flow, its utility as a general measure of program complexity is questioned. This deficiency of E in quantifying control flow complexity motivates the analytical evaluation of other measures which purport to capture this factor. The program knots measure, K, and the normal number of a program, NN, are shown to be inadequate in certain significant respects. The graph theoretic measure cyclomatic complexity, C, is shown to be applicable to program flow graphs, and C bears up well under analytical evaluation. Dissert. Abstr.

A VARIABLE METRIC ALGORITHM FOR THE SOLUTION OF THE SINGULAR THREE-DIMENSIONAL MISSILE AVOIDANCE
D. Blank and J. Shinar Jan. 1979 31 p refs
(Grant AF-AFOSR-3458-77)

(TAE-353) Avail: NTIS HC A03/MF A01

A variable metric algorithm is applied to the calculation of singular optimal control. A numerical example is solved to illustrate the feasibility and efficiency of the method. The results obtained show that the variable metric algorithm solves the problem in a relatively small number of iterations and short computer time. M.G.

COMPUTING REGION MOMENTS FROM BOUNDARY REPRESENTATIONS

J. M. Wilf and R. T. Cunningham. 1 Nov. 1979. 36 p. refs. (Contract NAS7-100)

(NASA-CR-162685; JPL-PUB-79-49) Avail: NTIS HC A03/MF A01 CSCL 09B

The class of all possible formulas for computing arbitrary moments of a region from the region's boundary is derived. The selection of a particular formula depends on the choice of an independent parameter. Several choices of this parameter are explored for region boundaries approximated by polygons. The parameter choice that minimizes computation time for boundaries represented by chain code is derived. Algorithms are presented for computing arbitrary moments for a region from a polygonal approximation of its boundary and for computing low order moments from chain encoded boundaries. K.L.

N80-16768*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.

SYMBOLIC-NUMERIC INTERFACE: A REVIEW

Edward W. Ng. 1 Jan. 1980. 21 p. refs. (Contract NAS7-100)

(NASA-CR-162690; JPL-PUB-79-106) Avail: NTIS HC A02/MF A01 CSCL 09B

A survey of the use of a combination of symbolic and numerical calculations is presented. Symbolic calculations primarily refer to the computer processing of procedures from classical algebra, analysis, and calculus. Numerical calculations refer to both numerical mathematics research and scientific computation. This survey is intended to point out a large number of problem areas where a cooperation of symbolic and numerical methods is likely to bear many fruits. These areas include such classical operations as differentiation and integration, such diverse activities as function approximations and qualitative analysis, and such contemporary topics as finite element calculations and computation complexity. It is contended that other less obvious topics such as the fast Fourier transform, linear algebra, nonlinear analysis and error analysis would also benefit from a synergistic approach. J.M.S.

N80-16769# George Washington Univ., Washington, D.C. Inst. for Management Science and Engineering.

SYMBOLIC FACTORABLE SUMT: WHAT IS IT, HOW IS IT USED

Abolfazl Ghaemi and Garth P. McCormick. 25 May 1979. 113 p. refs. (Contract N00014-75-C-0611)

(AD-A074903; Serial-T-408) Avail: NTIS HC A06/MF A01 CSCL 12/1

This report is intended to serve as a guide for coding, solving, and conducting sensitivity and elasticity analysis on a solution vector of general parametric nonlinear programming problems using the latest version of the computer programming model of Symbolic Factorable SUMT. The motivation for development of this model, which uses symbolic factorable input, and the process of its evolution is briefly reviewed. The relative merits and advantages of this model over its earlier versions, as well as over the SUMT-Version 4 model 1 is elaborated. The procedure for putting problems into symbolic factorable language that is digestible by the model, and the related model outputs, are fully explored. For illustrative purposes three increasingly difficult sample problems are coded, solved, and discussed in sufficient detail. For completeness, the theory of symbolic factorable sensitivity analysis that was developed in 4 is included as an appendix. GRA

COMPUTER IMAGE GENERATION TEXTURE STUDY. Final Report

Tony Stenger, William Dungan, and Richard Reynolds. Aug. 1979. 73 p. refs. (Contract F33615-77-C-0063; AF Proj. 6114)

(AD-A074019; AFHRL-TR-79-2) Avail: NTIS HC A03/MF A01 CSCL 12/1

This development project resulted from the need to enhance visual flight simulators (based on computer image generation (CIG) techniques) with textured surfaces. Pilots viewing homogeneous surfaces experience an inadequate perception of motion above these surfaces as well as an ambiguity in the orientation of the surface. Therefore, it was felt that by using textured surfaces within the scene, both depth and motion cues would be made available. This report describes the approaches and techniques used to develop texture material and introduce it into a complex CIG scene. The approach is to create texture tile arrays of trees and grass from digitized photographs of natural texture. These arrays are then replicated over the surface in the fashion of tiles. Preprocessing techniques are described which eliminate the periodic effect due to the tile boundary and macropatterns within the tile itself. Level-of-detail texture tile arrays are created that match the resolution of the texture to the appropriate observer-scene viewing geometry. The level-of-detail arrays and other descriptive parameters are merged into the existing CIG software to produce textured images. Scenes depicting a landing sequence, a divebomb, and a low-altitude flight were then generated. These images show the effect of the varying levels of detail, fields of viewing geometries, and scene deriving distance and motion cues from the additional information contained in the textured images. GRA

SOME N BY DN LINEAR COMPLEMENTARITY PROBLEMS SOLVABLE BY A PRINCIPAL PIVOTING ALGORITHM WITH APPLICATIONS

Ikuyo Kaneko and Jong-Shi Pang. Apr. 1979. 40 p. refs. Prepared in cooperation with Wisconsin Univ., Madison. (Contract N00014-75-C-0621; Grant NSF ENG-77-11136; RR0140701)

(AD-A073929; MSRR-435; WP-59-78-79) Avail: NTIS HC A03/MF A01 CSCL 12/1

The purpose of this paper is to study some recent applications of the n by dn LCP solvable by a parametric principal pivoting algorithm (PPP algorithm). First, it is shown that by analyzing the n by dn LCP we could study the problem of solving a system of equations and the (nonlinear) complementarity problem when the function involved is separable. Next, we examine conditions under which the PPP algorithm is applicable to a general LCP, and then present examples of LCP's arising from various applications satisfying the conditions, included among them is the n by dn LCP with a certain P-property. Finally we study a special class of n by dn LCP's which do not possess

the P-property but to which the PPP algorithm is still applicable, a major application of this class of problems is a certain economic spatial equilibrium model with piecewise linear prices. GRA

EXPALS: FORTRAN CODE FOR EXPONENTIAL APPROXIMATION BY LEAST SQUARES
C. D. Gardner. 1 Aug. 1978. 47 p.
(Contract W-7405-eng-48)
(UCRL-14541-Rev-2) Avail: NTIS. HC A03/MF A01

A FORTRAN program for obtaining a weighted least squares fit of a sum of exponentials to be run on CDC 6600 or CDC 7600 computers is described. This routine fits a linear combination of real exponential decay functions by the Prony-Householder iteration method. The mathematics and programming involved in EXPALS are presented. Also included are output of examples to test the program. DOE

N80-16783# California Univ., Livermore. Lawrence Livermore Lab.
DATA FLOW COMPUTING: SOFTWARE DEVELOPMENT
R. McGraw. 23 Jul. 1979. 11 p. refs. Presented at the Distributed Computing Systems Conf., Huntsville, Ala., 1-4 Oct. 1979.

(Contract W-7405-eng-48)
(UCRL-83026; CONF-791012-1) Avail: NTIS HC A02/MF A01

The problem of language design for a data flow environment is presented. Several alternatives are surveyed for a data flow language and then one specific effort is considered: MIT VAL. This language stresses implicit concurrency. Both programmer and translator can easily identify and exploit concurrency because VAL disallows all forms of side-effects and aliasing. An analysis of the language and areas of continued research is given. While substantial progress is made, much remains to be done in the areas of language design, translation, and use. DOE

N80-16784# Sandia Labs., Albuquerque, N. Mex.
COMPARISON OF NONLINEAR LEAST SQUARES SOFTWARE
K. L. Hiebert. Aug. 1979. 45 p. refs.
(Contract EY-76-C-04-0789)
(SAND-79-0483) Avail: NTIS HC A03/MF A01

The comparison of twelve readily available FORTRAN codes (E04GAF, E04FAF, LMDER, LMDIF, ISQFDN, LSQFDQ, LSQNDN, NL2SOL, NSO3A, SNWT, TJMAR1, ZXSSQ) which solve unconstrained nonlinear least-squares problems is presented. A set of 36 problems reported in the literature was used. To the extent possible, the parameters for the copes were set so as to have the codes solve equivalent problems. However, no code changes were made to achieve this goal. To test the robustness of the codes the initial starting value of the variables and the scaling of both the functions and the variables were varied. While measurements of efficiency such as the number of function evaluations and/or Jacobian evaluations and relative time were recorded, conclusions were based on the reliability of the codes. DOE

62 COMPUTER SYSTEMS

THE DESIGN AND IMPLEMENTATION OF USER ORIENTED SYSTEMS. Ph.D. Thesis
Nathan Relles. 1979. 195 p.
Avail: Univ. Microfilms Order No. 7924190

A taxonomy of user-oriented features of computer systems is developed, consisting of on-line aids, alternative modes of communication, defaults, language extensibility, and effective language design. A set of operating system capabilities is proposed to simplify and encourage the provision of user aids. A set of primitives realigning these capabilities was implemented in the form of a user interface that enables any system to provide user aids consistently, efficiently, and in an unobtrusive manner. An experiment was conducted to investigate the relationships among on-line aids, user performance, and ease of use. The user interface served both as an instrument and object of evaluation. In the first sense, the interface was used to implement the different forms of assistance under study and to monitor their use. At the same time, properties of the interface were evaluated with respect to their effect on ease of use and the effort required to incorporate on-line aids into a program. Dissert. Abstr.

N80-16786# California Univ., Livermore. Lawrence Livermore Lab.
CORRECTING THE PLOTTING SYMBOL POSITIONING ERROR IN TEKTRONIX'S GRAPH PLOT 50 SOFTWARE (4050A07 SERIES B)
L. B. Owen. 6 Aug. 1979. 11 p.
(Contract W-7405-eng-48)
(UCID-18234) Avail: NTIS HC A02/MF A01

A simple modification to the Graph Plot 50 software, devised for eliminating the symbol positioning error, is described. The eight most frequently used plotting symbols are automatically compensated to insure proper positioning when output is created on either the series 4050 screen display or the 4662 plotter. Other keyboard characters can be used as plotting symbols, if desired, but automatic positioning compensation is not provided. DOE

COMPUTER SCIENCE AND TECHNOLOGY: A KEY NOTARIZATION SYSTEM FOR COMPUTER NETWORKS. Final Report
Miles E. Smid. Oct. 1979. 39 p. refs.
(PB80-104698; NBS-SP-500-54; LC-79-600160) Avail: NTIS HC A03/MF A01 CSCL 09B

A cryptographic key notarization system is proposed for computer networks to protect personal (nonshared) files, to communicate securely both on and off-line with local and remote users, to protect against key substitution, to authenticate system users, to authenticate data, and to provide a digital signature capability using a nonpublic key encryption algorithm. The system is implemented by the addition of key notarization facilities which give users the capability of exercising a set of commands for key management as well as for data encryption functions. Key notarization facilities perform notarization which, upon encryption, seals a key or password with the identities of the transmitter and intended receiver. GRA

CLASSES OF NON-COMMUTATIVE RINGS WITH DEDE-

KIND DOMAIN-LIKE PROPERTIES AND MODULE OVER NON-COMMUTATIVE VALUATION RINGS Ph.D. Thesis
Bo-Yuan Chiu 1979 75 p
Avail: Univ. Microfilms Order No. 8002440

A notion of 'radial' of an ideal is introduced for right Noetherian polynomial identity rings and it is shown that in Noetherian dedekind orders, every primary ideal is a power of its radical, and that primary decompositions exist in Noetherian prime PI-rings. Classes of prime polynomial identity rings related to the dedekind rings and the relation of these classes, one to another, are investigated. These include ZPI-rings, multiplication rings, and weak multiplication rings. A weak cancellation property of ideal arithmetic is introduced, under which it is shown that for Noetherian rings the weak multiplication property implies the ZPI property, and that the classes of multiplication rings and weak multiplication rings are identical. Modules over some of the classes of rings are studied, and several generalizations of classical results about modules over the commutative specializations are discovered to hold. Dissert. Abstr.

N80-16791 Texas Univ. at Austin.
SMOOTH GROUP ACTIONS OF PRIME ORDER AND FIXED POINT SETS Ph.D. Thesis
Gary Alan Krause 1979 69 p
Avail: Univ. Microfilms Order No. 7928315

Given an odd prime action on a manifold, there are many different ways to orient the fixed set systematically which depend only on the prime and the ambient manifold. For certain actions, the signatures of the manifold and of the fixed set must be congruent modulo four for at least one of these orientation systems. An approach (using the structure of bordism rings of orientation preserving actions on closed smooth manifolds) to generalizing this congruence to all such orientation systems is indicated. It is shown that the generalization is true for generators of these rings. Dissert. Abstr.

THE DIRICHLET PROBLEM FOR QUASILINEAR ELLIPTIC EQUATIONS WITH LOWER REGULARITY AT THE BOUNDARY Ph.D. Thesis
Gary Mitchell Lieberman 1979 111 p
Avail: Univ. Microfilms Order No. 8001959

Solutions to the Dirichlet problem for quasi-linear elliptic, second order partial differential equations, i.e., classical solutions of these equations in a bounded n-dimensional domain with prescribed values on the boundary of the domain are considered. Results indicate that under appropriate hypotheses on the equation and the domain, the boundary gradient estimate holds for arbitrary boundary values which are continuously differentiable with Holder continuous first derivatives. Dissert. Abstr.

N80-16793 California Univ., Berkeley.
TRANSFORMATIONAL STRUCTURE OF ALGEBRAIC LOGICS Ph.D. Thesis
Richard Joseph Thompson 1979 345 p
Avail: Univ. Microfilms Order No. 8000540

A general approach to algebraic logic (in the restricted sense of algebraic theories adequate for investigating predicate logic-such as cylindric algebras and polyadic algebras) is presented. Given a variety of algebras, the members of which have Boolean algebras as reducts, the problem arises of showing that all nontrivial members of the variety (or all members of a subclass with a simple algebraic formulation) are subdirect products of certain concrete Boolean set algebras, to which other concrete operations have been adjoined. Dissert. Abstr.

N80-16794 Stanford Univ., Calif.
INFLUENCE FUNCTIONS FOR CENSORED DATA Ph.D. Thesis
Nancy Margaret Reid 1979 41 p
Avail: Univ. Microfilms Order No. 8001996

Influence curves of censored data estimators are considered. The influence curve is a function used in the theory of robust estimation both as a qualitative description of the robustness of an estimator and as a tool for calculating its asymptotic variance. The influence curve of the Kaplan-Meier estimate was calculated. It is shown that the influence curve provides an alternative derivation of the asymptotic variance of this estimate. The regularity conditions required to make this derivation rigorous were verified in the appendix. A chain rule for influence curves was established and was used to calculate the influence curves of censored data estimators that were functions of the Kaplan-Meier estimate. The robustness properties and asymptotic variances of these estimates follow directly. Some examples of this unified approach to calculating variances are given. Dissert. Abstr.

N80-16795 California Univ., Berkeley.
AN EXTENSION OF STRASSEN'S LAW AND SOME PROBABILISTIC RESULTS IN COMPLEX ANALYSIS Ph.D. Thesis
Carl Eric Mueller 1979 63 p
Avail: Univ. Microfilms Order No. 8000452

Several problems concerning Brownian motion and diffusion processes were investigated. A general theorem which contains two of the leading results about Brownian motion are Strassen's version of the law of the iterated logarithm and Levy's modulus of continuity for Brownian paths is proved. For both the law of the iterated logarithm and Levy's modulus, tests for upper and lower functions are known. These results are also shown to be corollaries of a single theorem. The BMO and BMO sub Rho spaces are characterized in terms of the stopping times of Brownian motion. This result resolves a conjecture of Sarason by characterizing BMO sub Rho in terms of Carleson measures. A probabilistic proof of a criterion for BMO due to Hayman and Pommerenke is given. Dissert. Abstr.

N80-16796 Iowa State Univ. of Science and Technology, Ames.
VARIANCE APPROXIMATIONS FOR ESTIMATORS OF FIXED AND RANDOM EFFECTS IN MIXED LINEAR MODELS Ph.D. Thesis
Raghu Nath Kackar 1979 171 p
Avail: Univ. Microfilms Order No. 8000143

The approximate variance formula involved the variances and the covariances of the variance component estimators. Approximate variances and covariances for the Maximum Likelihood and Restricted Maximum Likelihood estimators of the variance components are derived. The computation of these approximate variances and covariances involved evaluating central product moments of quadratic forms of normally distributed random vectors up to the fourth order. Alternative estimation procedures are derived by applying Bayesian concepts. Approximate procedures for interval estimation are also considered. The performance of the approximate variance formula was investigated numerically in the context of estimation of treatment contrasts in balanced incomplete block designs. Dissert. Abstr.

N80-16797 Stanford Univ., Calif.
CONSISTENT NONPARAMETRIC ESTIMATION OF BEST LINEAR CLASSIFICATION RULES/SOLVING INCONSISTENT SYSTEMS OF LINEAR INEQUALITIES Ph.D. Thesis
Richard Lee Greer 1979 294 p
Avail: Univ. Microfilms Order No. 8001930

A nonenumerative algorithm called the tree algorithm is presented which consistently estimates from training sample data those decision rules which are best in a fixed class of linear decision rules for classifying an observation vector into one of two multivariate distributions. The loss function used to define what is meant by a best classification rule is essentially any reasonable statistical measure of loss or in more precise terms, it is a function of the rule only through its misclassification probabilities and it is a nondecreasing function of those. The Bayes, Minimax, and Neyman-Pearson loss functions are included as well as new or relatively unnoticed loss functions derived from norms of the vector of misclassification probabilities. Dissert. Abstr.

OUTPUT ENSEMBLE AVERAGE OF PERIODICALLY EXCITED LINEAR TIME-VARYING SYSTEMS
E. Besner and J. Shinar May 1979 22 p refs

(TAE-372) Avail: NTIS HC A02/MF A01

Calculation of the mean square ensemble average of the nonstationary output of a linear time-varying system excited by a periodical random input is carried out by a direct method. Results can be obtained by a closed form solution or in a single computer run. The applicability of the method is illustrated using a missile intercept problem. Author

N80-16799*# Virginia Univ., Charlottesville. School of Engineering and Applied Science.

ANALYSIS AND TESTING OF NUMERICAL FORMULAS FOR THE INITIAL VALUE PROBLEM

R. Leonard Brown, Kurt R. Kovach, and Jeffrey L. Popyack. Jan. 1980. 95 p. refs.

(Grant NsG-1335)

(NASA-CR-162655; UVA-528149-AMCS80-101) Avail: NTIS HC A05/MF A01 CSCL 12A

Three computer programs for evaluating and testing numerical integration formulas used with fixed stepsize programs to solve initial value systems of ordinary differential equations are described. A program written in PASCAL SERIES, takes as input the differential equations and produces a FORTRAN subroutine for the derivatives of the system and for computing the actual solution through recursive power series techniques. Both of these are used by STAN, a FORTRAN program that interactively displays a discrete analog of the Liapunov stability region of any two dimensional subspace of the system. The derivatives may be used by CLMP, a FORTRAN program, to test the fixed stepsize formula against a good numerical result and interactively display the solutions. K.L.

CONFIDENCE INTERVALS FOR THE COMMON VARIANCE OF EQUICORRELATED NORMAL RANDOM VARIABLES

P. F. Ramig and S. Zacks. 1 Aug. 1979. 33 p. refs.

(Contract N00014-75-C-0529; NR Proj. 042-276)

(AD-A074339; TR-37) Avail: NTIS HC A02/MF A01 CSCL 12/1

Confidence intervals for the common variance of equicorrelated normal random variable are investigated. When the correlation coefficient is unknown no uniformly most accurate invariant confidence interval for the common variance exists. We develop interval estimators which are based on the asymptotically most efficient ones by employing the best asymptotic normality of the maximum likelihood estimators. In addition to their comparison with possible competitors, their small sample efficiency is studied. A method for determining exact coverage probabilities and expected length is developed. As a result of these investigations we concluded that interval estimators based on maximum likelihood estimators are to be recommended. GRA

GENERALIZED ADAMS METHODS

Ding Lee. 6 Jul. 1979. 51 p. refs.

(ZR0000101)

(AD-A074548; NUSC-TR-6011) Avail: NTIS HC A04/MF A01 CSCL 12/1

It is most desirable to use an accurate numerical method that allows the use of a large step size to solve stiff initial value problems. A family of generalized Adams-Bashforth and generalized Adams-Moulton methods, which we call GAB-GAM, are shown to be derived from nonlinear multistep (NLMS) methods. GAB-GAM methods are found to have advantages in solving (1) stiff equations; and (2) a class of underwater acoustic wave propagation problems. An application of these methods is included in this report. Also, an ANSI FORTRAN program, together with a set of numerical test examples, is included. GRA

NUMERICAL INVERSION OF LAPLACE TRANSFORMS M.S. Thesis

John Hollis Duncan. Jun. 1979. 192 p. refs.

(AD-A074438) Avail: NTIS HC A09/MF A01 CSCL 12/1

Inversion of Laplace transforms has been accomplished by a numerical integration along appropriate paths in the complex plane. Two general procedures have been used. The simpler and more economical employs a simple path, such as a parabola, which bends to the left. Accuracy is maintained by monitoring the oscillation of the integrand. A second method employs a steepest descent contour. GRA

ON Q-MATRICES, CENTROIDS AND SIMPLOTOPES

Richard W. Cottle and Rabe VonRandow. Jun. 1979. 38 p. refs.

(Contracts N00014-75-C-0267; Grant NSF MCS-76-81259)

(AD-A074959; SU-TR-79-10) Avail: NTIS HC A03/MF A01 CSCL 12/1

A necessary condition for a set of spherical (n-1)-simplicies to cover the sphere S(n-1) in R(n) is established. It is shown that the condition is also sufficient when $n = 2$ but is not so when $n > 2$. The result is viewed as a property of Q-matrices, which arise in connection with the linear complementarity problem. A partitioning theorem for a particular type of convex body known as a simplotope (the cartesian product of two simplices) is proved along with a theorem which states that the centroid of a suitable defined spherical sector has a positive inner product with each nonzero element of the sector. OPTIMAL INFORMATION ACQUISITION FOR RANDOMLY OCCURRING DECISIONS

Alimohammad Sharifnia. Sep. 1979. 154 p. refs.

(Contract N00014-79-C-0036)

(AD-A074956; SU-EES-DA-79-1) Avail: NTIS HC A08/MF A01 CSCL 12/1

This research investigates the information acquisition policies for randomly occurring decisions. A randomly occurring decision is a decision that must be made upon the occurrence of a precipitating event that occurs randomly with time. Due to the urgency often associated with this type of decision, it is difficult to obtain fresh information at the time of the decision. Therefore, the available information will be limited to the unfresh (old) information from the past. Since the information becomes outdated and obsolete in time, regular updating of the information is often desirable in order to be prepared for the decision. GRA

FAST ALGORITHMS FOR SOLVING PATH PROBLEMS

Robert Endre Tarjan. Apr. 1979. 50 p. refs.

(Contracts N00014-76-C-0688; NSF MCS-75-22870)

(AD-A074079; SU-STAN-CS-79-734) Avail: NTIS HC A03/MF A01 CSCL 12/1

Let G = (V,e) be a directed graph with a distinguished source vertex. The single source path expression problem is to find, for each vertex v, a regular expression P(s,v) which represents the set of all paths in G, from s to v. A solution to this problem can be used to solve shortest path problems, solve sparse systems of linear equations, and carry out global flow analysis. A method which computes path expressions by dividing G into components, computing path expressions on the components by Gaussian

elimination, and combining the solutions is described. This method requires O(m alpha(m,n)) time on a reducible flow graph, where n is the number of vertices in G, m is the number of edges in G, and alpha is a functional inverse of Ackermann's function. The method makes use of an algorithm for evaluation functions defined on paths in trees. A simplified version of the algorithm, which runs in O(m log n) time on reducible flow graphs, is quite easy to implement and efficient in practice. J.M.S.

QUALITATIVE STUDY OF NONLINEAR PROBLEMS IN ANALYSIS. Final Technical Report, 1 Jan. 1966 - 30 Jun. 1979
Jane Cronin Scanlon. 30 Aug. 1979. 12 p. refs.
(Contract DAHC04-75-C-0148; Grants DA-ARO(D)-31-124-G784; DA-ARO(D)-31-124-G1098; DA-ARO(D)-31-124-72-G69)
(AD-A074017; ARO-6131.25-M; ARO-12981.2-M; FTR-1) Avail: NTIS. HC A02/MF A01. CSCL 12/1

The objective of the work was to use qualitative methods, especially fixed point theorems and topological degree, to study nonlinear problems in analysis. Existence of solutions of wide classes of abstract nonlinear functional equations are established and the existence of recurrent and period solutions of nonlinear ordinary differential equations are obtained. Upper bounds for the number of such solutions are also obtained. (Such upper bounds for the number of periodic solutions of nonlinear ordinary differential equations have become significant in mathematical studies of chemical reactions.) Several results in the stability of periodic solutions of nonlinear ordinary differential equations were also established. Several mathematical problems which arise in physiology were studied. The most specific conclusion obtained is a clinical recommendation for the treatment of patients suffering from a rupture of an aneurysm of the circle of Willis. Finally, two books have been written: a textbook on qualitative theory of ordinary differential equations and a set of lecture notes on the mathematics of cell electrophysiology. GRA

VECTORIZED SPARSE EXAMINATION. Interim Report.
D. A. Calahan. Aug. 1979. 13 p. refs. Presented at the Sci. Computer Inform. Exchange Meeting, Livermore, Calif., 12-13 Sep. 1979.
(Grant AF-AFOSR-2812-75; AF Proj. 2304)
(AD-A074091; AFOSR-79-0980TR) Avail: NTIS. HC A02/MF A01. CSCL 12/1

Vectorizable sparse equation solution algorithms are classified by the matrix structure which they favor. The state-of-the-art for solution of relatively dense systems is then reviewed. A hybrid vector construct is defined for the increasingly common structure of both moderate local matrix density and global matrix regularity. Estimates are made of CRAY-1 speedup achievable with this construct. A finite difference matrix is studied as an example. GRA

USING SETS TO FIND MINIMAL CUT SETS IN LARGE FAULT TREES
R. B. Worrell and D. W. Stack. 1978. 22 p. Presented at the CUBE Symp., Los Alamos, N. Mex., 4 Oct. 1978.
(Contract EY-76-C-04-0789)
(SAND-78-1943C; CONF-781024-3) Avail: NTIS. HC A02/MF A01.

An efficient algebraic algorithm for finding the minimal cut sets for a large fault tree was defined and a new procedure which implements the algorithm was added to the Set Equation Transformation System. The algorithm includes the identification and separate processing of independent subtrees, the coalescing of consecutive gates of the same kind, the creation of additional independent subtrees, and the derivation of the fault tree stem equation in stages. The computer time required to determine the minimal cut sets using these techniques is substantially less than the computer time required to determine the minimal cut sets when these techniques are not employed. It is shown for a given example that the execution time required to determine the minimal cut sets can be reduced from 7,686 seconds to 7 seconds when all of these techniques are employed. DOE

LINEAR AND NONLINEAR STOCHASTIC OPERATORS. Ph.D. Thesis.
Kourken Malakian. 1979. 153 p.
Avail: Univ. Microfilms. Order No. 8001019

The error due to closure approximation in hierarchy equations is computed and interpreted through convenient matrix representations developed for both the inverse method and the closure approximations in hierarchy equations. Using the inverse method, improved solutions are developed which accelerate the rate of convergence of the iterative series to different orders. A physical interpretation is given to the improved solutions which gives a better insight into the relationships between the theory of approximations, mathematical modeling and physical systems. Through a description of the analytic foundations of the theory, generalized statistical measures are defined for stochastic processes and are used to compute the statistical measures of the different classes of stochastic systems. Dissert. Abstr.

SPECTRAL ESTIMATION FOR A RANDOMLY SAMPLED TIME-SERIES. Ph.D. Thesis.
Anthony Douglas Thrall. 1979. 171 p.
Avail: Univ. Microfilms. Order No. 8000544

An entomological study of population cycles in which the data was frequently recorded on an irregular daily basis is

described. Spectral time series analysis that would have been readily available had the data been recorded each day of the experiment are provided. The problem is initially considered in a broader framework of time series problems which depart from the assumption that observations were recorded at discrete equispaced times. A model, specific to the above experimental situation, was then developed using a zero-one variable Y(t), which indicates the days on which observations were made. The variable was assumed to be a sequence of independent Bernoulli variables having periodic probabilities. The model was chosen to reflect the tendency of the researcher to observe the experiment more often during the week than on weekends.

A BAYESIAN APPROACH TO THE SELECTION OF VARIABLES IN MULTIPLE REGRESSION Ph.D. Thesis
Ramona Bowers Swaine 1979 122 p
Avail: Univ. Microfilms Order No. 8000951

A Bayesian approach to the selection of predictor variables for linear univariate multiple regression analysis is considered. Comparison of regression equations is made via the variance of the predictive distribution of the dependent variable. The predictor variables may be fixed and known, or they may be stochastic and unknown at the time the variable selection decision is made. These cases are considered separately. Prior distributions which allow for relationships among regression parameters of different equations are used. It is demonstrated that the predictive distribution variance permits exclusion of possible predictors in some cases. Empirical analysis shows the effects of changing the prior information used in making the decision and reveals that the predictive variance criterion gives results comparable to other popular variable selection criteria. Dissert. Abstr.

N80-16816 California Univ., Berkeley.
TESTS FOR NORMALITY AND SYMMETRY Ph.D. Thesis
Seongil Park 1979 54 p
Avail: Univ. Microfilms Order No. 8000473

Tests for normality, more generally symmetry, based on sample spacings are considered. Conditions are given under which the tests are unbiased and have isotopic power properties under convex orderings, when the weight function and scale estimator satisfies certain conditions. Asymptotic normality of the tests were obtained under mild conditions on the weight function and the underlying distribution function. Consistency of the tests are shown for certain alternatives. Asymptotically, optimal procedures were investigated and an efficient procedure was found. Pitman efficiencies of known tests were obtained and a new test which improves these tests was proposed.

Dissert. Abstr.

ROBUST CONFIDENCE INTERVALS FOR THE ONE- AND TWO-SAMPLE PROBLEMS Ph.D. Thesis
Karen Kafadar 1979 259 p
Avail: Univ. Microfilms Order No. 7928475

A robust confidence interval for location in the one-sample problem and for the difference in locations for the two-sample problem is evaluated for its efficiency in stretched-tailed situations. The confidence interval uses an M-estimate called the biweight and its estimated variance, and the critical point from a standard Student's-t distribution. Using Monte Carlo simulation techniques, the biweight confidence intervals are shown to be highly efficient, even for extremely small error rates, on samples of sizes 5, 10, and 20. For common underlying distributions, a biweight-confidence interval using pooled scales is to be recommended, and the distribution of biweight-'t' can be approximated by a Student's-t on nine-tenths of the nominal degrees of freedom. When the underlying distributions are suspected to be different, an unpooled scale estimate should be used, and the distribution of 't' approximated by Student's-t on three-fourths of the degrees of freedom. Dissert. Abstr.

An expression is obtained for the distribution function of the random variable the definite integral of ZdP where P is a random distribution function chosen by Ferguson's (1973) Dirichlet process on (R, B) (R is the real line and B is the o-field of Borel sets) with parameter alpha, and Z is a real-valued measurable function defined on (R, B) satisfying the definite integral of the absolute value of Z to the derivative of alpha - infinity. As a consequence, we show that when alpha is symmetric about O and Z is an odd function, then the distribution of the definite integral of ZdP is symmetric about zero. GRA

The topology of the space of minimal transfer functions has been studied with particular emphasis on symmetric transfer functions and a number of important new results have been obtained. Understanding the topology of the space of transfer functions is important in the development of identification algorithms and symmetric transfer functions arise in the description of many physical systems. The problem of state space realization of transfer functions for systems with delays has also been studied and useful results have been obtained. The problems of deterministic control, stochastic filtering and stochastic control have been studied for linear pure delay time systems. A geometric approach has been used which has simplified previous results and has obtained new results. In addition, preliminary investigations of some other related research areas has commenced.

INTERACTIVE SOLUTION OF MULTICRITERION ZERO-ONE VARIABLE PROBLEMS WITH UNCERTAIN INFORMATION Ph.D. Thesis
Priyadarshi Ramprasad Shukla 1979 253 p
Avail: Univ. Microfilms Order No. 8002012

Algorithms for solving multicriterion zero-one variable problems with uncertain information are developed. Two cases of uncertainty for the trade off values are explored. The first case considers a range for the trade off value instead of a certain unique value. The second case assumes that the basic information structure is probabilistic and that the unique tradeoff value being obtained is generated from this probabilistic structure. Computational experience with the interactive algorithm obtained by solving nine different problems with two or three criteria and up to 35 zero-one variables shows that the performance of the algorithm is acceptable for practical application. The algorithm performs acceptably well even when the tradeoffs are assessed with considerable uncertainty. Dissert. Abstr.

AN AVERAGING BATTERY MODEL FOR A LEAD-ACID BATTERY OPERATING IN AN ELECTRIC CAR Final Report
John M. Bozek Dec. 1979 19 p refs
(Contract EC-77-A-31-1044)
(NASA-TM-79321; DOE/NASA/1044-79/5; E-277) Avail: NTIS HC A02/MF A01 CSCL 12B

A battery model is developed based on time averaging the current or power, and is shown to be an effective means of predicting the performance of a lead acid battery. The effectiveness of this battery model was tested on battery discharge profiles expected during the operation of an electric vehicle following the various SAE J227a driving schedules. The averaging model predicts the performance of a battery that is periodically charged (regenerated) if the regeneration energy is assumed to be converted to retrievable electrochemical energy on a one-to-one basis. WEAK BASES FOR TOPOLOGICAL SPACES Ph.D. Thesis
Leslie Owen Foged 1979 78 p
Avail: Univ. Microfilms Order No. 8002448

Weak bases are studied with emphasis on sequential spaces. Several characterizations of the sequential order of a topological space are presented and the existance of countable regular spaces of arbitrary finite sequential order is proven. Countable Hausdorff spaces of arbitrary sequential order are constructed. A g-metrizable space which is is not g-developable is constructed and it is proven that a regular space is g-metrizable if and only if it is weakly first countable and admits a sigma-locally finite k-network. It is demonstrated that a g-metrizable space is stratifiable if it has finite sequential order or if it admits a sigma-locally finite covering by compact sets. Dissert. Abstr.

AN EXAMINATION OF COUPLED MODE THEORY AS APPLIED TO UNDERWATER SOUND PROPAGATION Ph.D. Thesis
Steven Ross Rutherford 1979 217 p
Avail: Univ. Microfilms Order No. 7928353

The mathematical formalism of coupled mode theory as applied to underwater sound propagation in a range dependent, ocean environment was investigated theoretically. The range dependence of an acoustic medium may be characterized by two types, range variability of the geoacoustic parameters such as sound speed and range variability of the boundary conditions. Both types of range variation are considered and coupled mode theory and its various approximations with respect to the range variability of the ocean bottom are examined. Numerical calculations for the field in a wedge-shaped waveguide are presented to illustrate the effects of the boundary condition approximation and to show how the modifications to the theory produce the desired results. The mathematical formalism is presented in a form amenable to numerical calculations. Also, numerical methods for implementing the theory are described and discussed. Dissert. Abstr.

THE DESIGN OF EFFICIENT, BROADBAND ULTRASONIC TRANSDUCERS Ph.D. Thesis
John Douglas Fraser 1979 189 p
Avail: Univ. Microfilms Order No. 8001918

A new perturbation theory for wedge transducers was developed. In each case, the fundamentals of the operation of the transducers are discussed, and design techniques are given. Supporting technology was also developed, including the fabrication of composite acoustic materials, formation of acoustically thin bonds, and electrical matching transformers. Characterization techniques are given, and results are compared with theory and with the prior state of the art. Octave bandwidth bulk wave transducers operating in water with less than 4 dB total round trip insertion loss and good impulse responses were produced, as well as practical wedge transducers with conversion efficiencies as high as 44%. These transducers offer improved resolution in imaging applications and greater time-bandwidth products in signal processing applications as well as improved signal-to-noise ratio in both applications. Dissert. Abstr.

N80-16834 Stanford Univ., Calif.
A STOCHASTIC APPROACH TO ULTRASONIC TISSUE CHARACTERIZATION Ph.D. Thesis
Linda Fellingham Joynt 1979 122 p
Avail: Univ. Microfilms Order No. 8001949

Successive echo trains returned from insonified tissue were considered to be sample functions from a random process. Radio frequency echoes returned from the body during ultrasound examination by a clinical B-mode instrument were recorded in real time and subsequently analyzed off-line. Various studies of the heart were made in an attempt to develop a tissue signature characterizing diseased heart muscle as distinct from normal heart muscle. Models for normal and damaged myocardium were developed that led to a successful differentiation based on the statistics of the amplitude distributions of the returned echoes. Rician probability density functions were shown to provide a good fit to data from 'in vivo' hearts. Studies of other tissues were performed applying frequency domain. Frequency spectra were developed and used to yield information about the average spatial structure that was not discernible on the usual ultrasonic scanner display. Dissert. Abstr.

ESTIMATION OF NOISE SHIELDING BY BARRIERS
1979 41 p
(ESDU-79011; ISBN-0-85679-255-1) For information on availability of series, sub-series, and other individual data items, write NTIS, Attn: ESDU, Springfield, Va. 22161. HC $770.50

When a barrier is placed between a sound source and an observer, sound reaches the observer by diffraction over the top of the barrier, or round the barrier edges, and by direct transmission through the barrier. In many practical cases the barrier is designed such that the transmission path is so highly attenuated that it may be neglected. Hence this item is only concerned with the sound reaching the observer via the edge of the barrier. A method is provided for estimating the shielding effect of a barrier in terms of the difference in sound level received at a given location on the side of the barrier remote from the noise source and the sound level received at the same location without the barrier. The sound attenuation due to a barrier is therefore dependent on the redistribution of sound energy by diffraction over the top, and round the edges, of the barrier and the increased propagation losses which result from the change in the length and direction of the sound propagation path due to the presence of the barrier. In the procedure used in this item for estimating the loss due to diffraction it is assumed that the noise is emitted by a point source and that both the source and observer are at large distances from the diffracting edge relative to the wavelengths of the sound considered. Also it is assumed that barriers are rigid, wedge-shaped (as described below) and have hard surfaces and sharp edges. ESDU

EVALUATION OF THE ATTENUATION OF BROAD-BAND SOUND BY A NON-UNIFORM STILL ATMOSPHERE
1978 65 p Supersedes ESDU-78003
(ESDU-78003-A; ESDU-78003; ISBN-0-85679-228-4) For information on availability of series, sub-series, and other individual data items, write NTIS, Attn: ESDU, Springfield, Va. 22161. HC $578.50

This item provides a means of estimating the attenuation of sound across a frequency band, referred to as band attenuation, by the atmosphere in which the temperature and relative humidity vary along the propagation path. The band attenuation rate is estimated by integrating the discrete frequency attenuation over the appropriate frequency range. Values of discrete frequency attenuation are found. Allowance is made for spectrum shape, and guidance is given on the use of a layering technique for the estimation of attenuation when atmospheric properties vary with altitude. The atmospheric layering technique should be used only when the variation of the atmospheric parameters with altitude is known with sufficient confidence to enable the division of the atmosphere into layers within which temperature and relative humidity vary linearly with altitude. When considering

horizontal propagation of sound where the temperature and relative humidity vary along the propagation path, the suggested layering technique can be used by substituting linear distance for altitude. In this case any change in pressure between the layers due to variations in temperature is extremely small and should be neglected. A numerical method for the estimation of the band atmospheric attenuation rate, assuming an ideal filter shape, is given as the recommended prediction procedure. Listings of the programmed method in both BASIC and FORTRAN are provided. To enable a rapid estimate of the one-third octave band atmospheric attenuation rate to be made, an alternative graphical procedure is provided. A typical application is the correction of aircraft noise measurements to standard atmospheric conditions. ESDU

SECOND SOUND SHOCK WAVES AND CRITICAL VELOCITIES IN LIQUID HELIUM 2 Ph.D. Thesis
Timothy Neal Turner 1979 231 p refs
(Grant NsG-7508)
(NASA-CR-162687) Avail: NTIS HC A11/MF A01 CSCL 20A

Large amplitude second-sound shock waves were generated and the experimental results compared to the theory of nonlinear second-sound. The structure and thickness of second-sound shock fronts are calculated and compared to experimental data. Theoretically it is shown that at T = 1.88 K, where the nonlinear wave steepening vanishes, the thickness of a very weak shock must diverge. In a region near this temperature, a finite-amplitude shock pulse evolves into an unusual double-shock configuration consisting of a front steepened, temperature raising shock followed by a temperature lowering shock. Double-shocks are experimentally verified. It is experimentally shown that very large second-sound shock waves initiate a breakdown in the superfluidity of helium 2, which is dramatically displayed as a limit to the maximum attainable shock strength. The value of the maximum shock-induced relative velocity represents a significant lower bound to the intrinsic critical velocity of helium 2. M.G.

STRESS WAVE ATTENUATION IN THIN STRUCTURES BY ULTRASONIC THROUGH-TRANSMISSION Final Report
Samson S. Lee and James H. Williams, Jr. Washington NASA Jan. 1980 32 p refs
(Grant NsG-3210)
(NASA-CR-3203) Avail: NTIS HC A03/MF A01 CSCL 20A

The steady state amplitude of the output of an ultrasonic through transmission measurement is analyzed and the result is given in closed form. Provided that the product of the input and output transduction ratios; the specimen-transducer reflection coefficient; the specimen-transducer phase shift parameter; and the material phase velocity are known, this analysis gives a means for determining the through-thickness attenuation of an individual thin sample. Multiple stress wave reflections are taken into account and so signal echoes do not represent a difficulty. An example is presented for a graphite fiber epoxy composite (Hercules AS/3501-6). A direct method for continuous or intermittent monitoring of through thickness attenuation of plate structures which may be subject to service structural degradation is provided. M.M.M.

EXPERIMENTAL EVALUATION OF ACTIVE AND PASSIVE MEANS OF ALLEVIATING ROTOR IMPULSIVE NOISE IN DESCENT FLIGHT
D. S. Janakiram Nov. 1979 86 p refs
(Contract NAS1-15337)
(NASA-CR-159188; RASA/SRL-14-79-04) Avail: NTIS HC A05/MF A01 CSCL 20A

A controlled wind tunnel test program was conducted on a model 2.14 m (7 ft) diameter teetering rotor to determine the effectiveness of blade tips such as the Ogee tip and the TAMI (Tip Air Mass Injection) tip in reducing the impulsive noise due to blade-vortex interaction in descent flight. In addition, a full rectangular tip which has the same span as the Ogee tip and an effective rectangular tip which has the same lifting area as the Ogee tip were also considered. The tests were conducted at two advance ratios (0.125 and 0.14) with various descent rates ranging from steady level flight to about 6 m/sec (20 ft/sec). A comparison of the performance of different rotors showed that for the same tip Mach number and thrust, the Ogee tip rotor absorbed more power than the full rectangular tip rotor, while the TAMI tip rotor absorbed more power than the effective tip rotor. PROPAGATION OF SOUND THROUGH THE ATMOSPHERE: EFFECTS OF GROUND COVER 2 Final Report, 1976 - 1979
H. E. Bass and L. N. Bolen 30 Jun. 1979 55 p refs
(Grant DAAG29-76-G-0258)
(AD-A073262; PARGUM-79-01; ARO-14002.2-EX) Avail: NTIS HC A04/MF A01 CSCL 20/1

Measurements of sound amplitude in the vicinity of a ground plane have been made as a function of frequency of the sound source (50 Hz - 2000 Hz), distance of propagation (5m - 300m), and surface conditions. By treating the impedance as an adjustable parameter, the surface impedance as a function of frequency was determined from the measured amplitudes using a theoretical treatment of a spherical wave in the vicinity of a locally reacting surface. The impedance measurements covered the frequency range 50 Hz to 1000 Hz. In this frequency range, the results for three distinctly different surfaces suggest that the impedance can be computed from the specific flow resistance and that grass has little effect on the surface impedance except for decreasing the flow resistance due to the root structure. Experimental studies of surface impedance should include measurements of soil parameters such as density, specific flow resistance, and moisture content so that comparisons can be made between the results from different laboratories and so that a data base for additional theoretical development can be established. THEORETICAL STUDIES OF EXCESS ELECTRON MOBILITIES AND CHANGE-TRANSFER SPECTRA Ph.D. Thesis
Jeanne Louise McHale 1979 112 p
Avail: Univ. Microfilms Order No. 8000968

A theoretical formalism describing the dynamics of an excess electron in equilibrium with a molecular fluid is developed. The Hamiltonian for the solvent molecules plus the extra electron was partitioned to allow the effects of the external medium to be treated in an average manner. The mean square distance traveled by the electron as a function of time was found by averaging the second moment of the electron density over the solvent molecules' positions and momenta. The influence of solvent structure and solvent dynamics on the migration of the electron is discussed. The model was applied to a one dimensional system with nearest neighbor interaction. The equations are discussed in terms of the influence of solvent molecules' fluctuations on the type of motion observed. Applications to two component systems are also treated. Dissert. Abstr.

LOW ENERGY ELECTRON VIBRATIONAL EXCITATION OF MOLECULES ADSORBED ON SURFACES: EXPERIMENT AND THEORY Ph.D. Thesis
Wilson Ho 1979 292 p
Avail: Univ. Microfilms Order No. 7928141

A specified amount of the desired molecules are let into the vacuum system and allowed to adsorb on the surface. A beam of low energy electrons is incident on the surface and the scattered electrons are energy analyzed. Some of the electrons scatter inelastically, typically 1 part in a thousand, due to vibrational excitation of the adsorbed molecules. The character-

istic discrete energy losses reflect the particular chemical bonds of the adsorbed species on the surface. As in conventional infrared absorption and Raman scattering spectroscopies, chemical identification and molecular structural determination are possible by analyzing the vibrational frequencies and intensities. The sensitivity for detecting the adsorbed species is approximately 0.01 of the fractional coverage of the surface. Dissert. Abstr.

N80-16843 California Univ., Berkeley.
SELECTED TOPICS ON THE ELECTRONIC STRUCTURE OF SMALL MOLECULES Ph.D. Thesis
William Clarence Swope 1979 75 p
Avail: Univ. Microfilms Order No. 8000533

A systematic procedure is presented for constructing symmetrized functions of the coordinates of N fermion particles which may be used as trial wavefunctions in a quantum mechanical description of an N electron molecular system. The functions are symmetrized with respect to the mathematical point of operators which commute with the system's electronic Born-Oppenheimer Hamiltonian, as well as the permutation group. The coupling procedure is applied to the study of the electronic structure of several states of the diatomic molecule sulfur oxide. A model is presented which provides insight into some of the electric anp magnetic properties of small molecules. Dissert. Abstr.

STUDIES OF ATOMS AND MOLECULES USING MULTIPHOTON ABSORPTION OF ULTRAVIOLET LASER RADIATION Ph.D. Thesis
Daniel Jacob Kigler 1979 160 p
Avail: Univ. Microfilms Order No. 8001954

Properties of excited atoms and molecules are studied using multiphoton absorption rare-gas-halide laser radiation. The basic technique involves observation of fluorescent emission from gas samples irradiated by an ArF (193 nm) or KrF (248 nm) laser. Following a review of the properties of RGH lasers and their application to nonlinear excitation, three sets of experiments are described. First, collisional and photoabsorption properties of electronically excited H2 are studied by means of selective excitation of the H2 E, F 1 Sigma g + double minimum state. Two-photon excitation of Xe (5p5 6p) at 248 nm and of Xe(+) and Kr (4p5 6p) at 193 nm forms the basis for another group of experiments. Finally, studies of photolytic production of S(1S) atoms by two-photon dissociation of OCS at 193 nm are reported. Dissert. Abstr.

THE TEMPERATURE AND DENSITY DEPENDENCE OF THE NUCLEAR SPIN-SPIN INTERACTION IN HD GAS AND FLUID Ph.D. Thesis
James Richard Beckett 1979 286 p
Avail: Univ. Microfilms Order No. 7928383

Precise measurements were made of the temperature and density dependence of the indirect electron coupled nuclear spin spin interaction (J sub HD) in HD gas and liquid. These precise measurements were possible because of the double resonance spin echo technique. The use of this spin echo technique in principle allowed the frequency resolution of the measurements to be determined by the transverse decay time T sub 2, rather than by the magnetic field inhomogeneity determined decay time T sub 2. Measurements of J sub HD in liquid HD were made to precision of + or - .002 Hz. Dissert. Abstr.

N80-16847 Stanford Univ., Calif.
THE PRODUCTION OF NEUTRINOS AND NEUTRINO-LIKE PARTICLES IN PROTON-NUCLEUS INTERACTIONS Ph.D. Thesis
John Patrick Dishaw 1979 162 p
Avail: Univ. Microfilms Order No. 8001904

An experimental search was performed to look for the direct production of neutrinos or neutrino like particles. Possible sources of such particles include the semileptonic decay of new heavy particles such as charm, and the direct production of a light neutral Higgs particle such as the axion. The production of these particles was inferred by energy nonconservation in the collision of a proton with an iron nucleus. The total visible energy of the interaction was measured using a sampling ionization calorimeter. The calorimeter was calibrated with muons. Energy nonconservation in the data is manifest as a nonGaussian distribution on the low side of the calorimeter measured energy. Model calculations yielded the fraction of events expected in the nonGaussian behavior for the various sources of neutrinos or neutrino like particles. Dissert. Abstr.

ON THE MANY-BODY THEORY FOR SYSTEMS CONSISTING OF COMPOSITE PARTICLES Ph.D. Thesis
Sadhu Mahendra Singh 1979 137 p
Avail: Univ. Microfilms Order No. 7923430

The many body theory for a system composed of two species, each consisting of spin 1/2 elementary constituents, was formulated in terms of four constituent composites from the first principle. The identical constituent pair language and nonidentical constituent pair language are derived from the four constituent composite language. Using a simple separable potential, for Bose like condensation of the fermion pairs into the lowest energy state, the critical density for the pair condensation in the lowest energy state as a function of the interaction strength, the momentum distribution function in the condensed mode, the pair binding energy in the low density limit as a function of the interaction strength and the ground state energy per pair as a function of the density are computed within the composite Hartree-Fock approximation. Dissert. Abstr.

N80-16850 Washington Univ., St. Louis, Mo.
THE SIMPLE ATOMIC HOPPING PROBLEM. PARTICLE CORRELATION FUNCTIONS WITH APPLICATION TO DIPOLAR INDUCED SPIN LATTICE RELAXATION Ph.D. Thesis
Otto Francis Sankey 1979 160 p
Avail: Univ. Microfilms Order No. 8002462

A model of atomic hopping is developed which takes into account the correlated motion of distinguishable particles in a lattice. These correlations are included by prohibiting multiple occupancy of a lattice site or particles to pass through each other. The method is used to derive expressions for the correlation functions which describe the motion of a single specific particle or a pair of distinguishable particles. These correlation functions are indirectly measured in NMR relaxation time studies where the relaxation is caused by magnetic dipolar interactions. Particular attention is given to spin lattice relaxation time of hydrogen in disordered phases of various metal hydrides. Dissert. Abstr.

NON-MAXWELLIAN VELOCITY DISTRIBUTION FUNCTIONS ASSOCIATED WITH STEEP TEMPERATURE GRADIENTS IN THE SOLAR TRANSITION REGION. PAPER 2: THE EFFECT OF NON-MAXWELLIAN ELECTRON DISTRIBUTION FUNCTIONS ON IONIZATION EQUILIBRIUM CALCULATIONS FOR CARBON, NITROGEN AND OXYGEN
Robert Roussel-Dupre [1979] 21 p refs
(Contract NAS5-22409; Grants NsG-7536; NSF ATM-78-22202; NSF GA-31477)
(NASA-CR-162695) Avail: NTIS HC A02/MF A01 CSCL 20H

Non-Maxwellian electron velocity distribution functions, previously computed for Dupree's model of the solar transition region are used to calculate ionization rates for ions of carbon, nitrogen, and oxygen. Ionization equilibrium populations for these ions are then computed and compared with similar calculations assuming Maxwellian distribution functions for the electrons. The results show that the ion populations change (compared to the values computed with a Maxwellian) in some cases by several orders of magnitude depending on the ion and its temperature of formation. INTERACTIONS OF MOLECULAR AND ION BEAMS WITH SURFACES Final Report, 1 Jan. 1977 - 31 May 1979
J. Wayne Rabalais 21 Jun. 1979 27 p refs
(Grant DAAG29-77-G-0054)
(AD-A073278; ARO-14361.24-C; FR-1) Avail: NTIS HC A03/MF A01 CSCL 20/8

Low kinetic energy active ion bombardment of transition metals, Si, Ge, Sn, Pb, graphite, and diamond have shown that chemical reactions can be induced between ion beams and surfaces. These reactions are specific and selective with respect to the ion-target combination and the thickness of the reacted layer can be controlled by varying the ion energy. The techniques of X-ray and UV photoelectron spectroscopy, auger spectroscopy, secondary ion mass spectrometry (SIMS) and thermal desorption spectrometry (TDS) under ultra-high vacuum conditions are used to characterize the products of the beam-surface reactions. The reaction of 30-3000 eV nitrogen beams with the first-row transition metals results in the formation of metal nitrides. The amount of nitrogen reacting with the metal can be correlated to the enthalpy of formation of the metal nitride. Reactions of nitrogen with M, MO, and MO2 (M = Si, Ge, Sn, Pb) produces nitrides with no evidence for nitrate, nitrite, or nitroso formation in the oxides. A mechanism is proposed for the reaction which involves charge exchange neutralization and dissociation of the ion at the surface followed by penetration into the lattice, thermalization, and finally chemical reaction. CENTRAL COLLISIONS IN INTERMEDIATE ENERGY HEAVY-ION REACTION
C. Y. Wong 1979 36 p refs Presented at the Symp. on Heavy Ion Phys. from 10-200 MeV/A, Upton, N.Y., 16 Jul. 1979
(Contract W-7405-eng-26)
(CONF-790743-5) Avail: NTIS HC A03/MF A01

To understand the underlying physics, the effect of the mean field and the effect of particle collisions are studied separately. It is found that the sudden increase in the density of the overlapping region can cause the volcano effect, leading to the complete disintegration of one of the nuclei. The self-consistent mean field also gives rise to the bunching instability when the two Fermi spheres of the colliding nucleons separate. The collision between nucleons, on the other hand, leads to irreversible dissipation, thermalization, and the possibility of a hydrodynamical description of the dynamics. The dynamics of central collisions were studied using the hydrodynamical description for many combinations of targets and projectiles at different energies. The formation of shock waves, sidesplash, and the complete disintegration of the whole nucleus are examined. Nuclear viscosity is found to affect the angular distribution of the reaction products and also the maximum compression ratio achieved during the collision. DOE

COHERENCE EFFECTS IN HEAVY ION-ATOM COLLISIONS
C. Bottcher 1978 16 p refs Presented at Workshop on Coherence and Correlation in Atomic Collisions, London, 18 Sep. 1978
(Contract W-7405-eng-26)
(CONF-780936-1) Avail: NTIS HC A02/MF A01

An approach to charge capture and ionization by highly stripped projectiles is described and shown to explain cross section systematics through the periodic table. Oscillations in cross section with respect to charge state observed around atomic number 70 are explained as an f-wave resonance in the target electron-projectile scattering. The ratio of H2 to H cross sections for both light and heavy projectiles is shown to fit a two center coherent scattering model; independent scattering by the two centers is not a good assumption for velocities below 4 A.U. Similar coherence effects are predicted in stripping by molecular gases even in multielectron processes wodre the independent atom model might be thought valid. Recent experiments on the forward peak of electrons ejected from the projectile show interesting structure which can be partly explained without invoking interference effects. DOE

INDEPENDENT PARTICLE ASPECTS OF NUCLEAR DYNAMICS Ph.D. Thesis
Michael Cornelius Robel 1979 283 p
Avail: Univ. Microfilms Order No. 8000492

A generalization of the independent particle model from nuclear statics to nuclear dynamics is discussed. Attention is centered on the average behavior of nuclear dynamics, as opposed to detailed behavior, such as the characteristic of shell effects in nuclear statics. A one body model is applied to nuclear vibrations. The wall formula which supplies the dissipation is appended to the standard, hydrodynamical theory of vibrations. The combination of internal, Fermi motion, and relative nuclear motion with refraction at the host's surface is calculated to produce well focused emission patterns in velocity space, which are called Fermi jets. Dissert. Abstr.

RESONANCES IN NUCLEAR PHYSICS Ph.D. Thesis
Mosleh-Uddin Ahmed 1980 92 p
Avail: Univ. Microfilms Order No. 8002604

Resonance phenomena in nuclear physics are examined in the light of the analytic properties of the S matrix. A resonant state is considered to correspond to a suitably located pole in the S matrix or the scattering amplitude. A procedure is described for extracting the pole position of a resonant amplitude from a knowledge of the phase shift versus energy. Effective range expansion of the scattering amplitude is invoked to obtain the energy dependence. Pole positions are determined for the four p-wave resonances in the nucleon-alpha system with high precision. The use of pole position to define the mass of unstable nuclear states is discussed and the model independence of the pole position is emphasized. Dissert. Abstr.

FUSION: THE POWER SOURCES OF THE FUTURE INERTIAL CONFINEMENT OPTION
V. Rupert 13 Jun. 1979 19 p Presented at the Soc. of Women Engr. Natl. Student Conf., San Francisco, 27 Jun. 1979
(Contract W-7405-eng-48)
(UCRL-82768; CONF-790698) Avail: NTIS HC A02/MF A01

The advantageous features and the methods being pursued toward achieving power generation from inertial confinement fusion are discussed. The concept of nuclear fusion is reviewed which includes a discussion of fusion reactions using deuterium and tritium. Research progress in inertial confinement fusion is reported and the application of lasers, electron beams, and ion beams to drive the compression and heating of the fusion fuels is surveyed. A.W.H.

PULSE PILEUP EFFECTS OF PLASMA ELECTRON TEMPERATURE MEASUREMENTS BY SOFT X-RAY ENERGY ANALYSIS
G. R. Dyer, G. H. Neilson, and G. G. Kelley Oct. 1978 26 p refs
(Contract W-7405-eng-26)
(ORNL/TM-6541) Avail: NTIS HC A03/MF A01

The electron temperature of hot plasmas was derived from

bremsstrahlung spectra obtained by pulse height analysis using a lithium compensated silicon detector. Time resolved temperature measurements required high counting rates, with ultimate rate limted by pulse pileup. To evaluate this limit, spectral distortion due to pileup and consequent effects on temperature determination were investigated. Expressions for distorted spectra were derived as functions of Maxwellian temperature and pileup fraction for both square and triangular pulse shapes. A comparison of temperatures obtained from distorted spectra with actual values indicates that measurements with less than 10 percent error can be made in the absence of line radiation, even from spectra containing 40 percent pileup. TIME INTEGRATING OPTICAL SIGNAL PROCESSING Ph.D. Thesis
Peter Kellman. 1979. 149 p.
Avail: Univ. Microfilms Order No. 8001952
Optical techniques for linear signal processing applied to large time bandwidth product operations are examined. A comprehensive treatment of time integrating acousto-optic signal processing is given. The extension of one dimensional time integrating optical correlation to two dimensional processing, the concept of interferometric detection with electronic reference, and the generalization of these signal processing techniques to complex computation are discussed. One and two dimensional complex signal processing algorithms are developed for noncoherent optical realizations and the class of achievable signal processing operations is derived. Analysis of time integrating algorithms for complex spectral analysis and ambiguity function processing is presented. Correlation and power spectral estimates are defined and signal to noise ratios are derived. Dissert. Abstr.

DESIGN OF A REFLECTION ON APPARATUS FOR LASER BEAM PROFILE MEASUREMENTS
Eric G. Johnson, Jr. Jul. 1979 128 p refs Sponsored in part by DOD, Calibration Coordination Group
(Contract CCG-78-109)
(PB80-101256; NBS-TN-1015) Avail: NTIS HC A07/MF A01 CSCL 20F

Topics covered include: (1) the use of Fourier optics concepts with off-axis reflections and rough surfaces to provide the basis for accurate computer simulation of laser beams; (2) the program, BEAM, which generates the expected behavior of the apparatus under variation of laser wavelength, physical dimensions for curvatures, hologram structure, and changes in positions of the various components; (3) the simulation results which demonstrate the expected characteristics for the apparatus; and (4) the key element in the apparatus, namely the reflection hologram, which requires discussion of the design, construction, and testing of this element. The Hartman plate method is described briefly so that a comparison between it and the holographic method can be made. The comparison shows why the holographic method is best for a standard for irradiance and phase-front measurements. GRA

TWO-DIMENSIONAL EIGENMODE ANALYSIS OF THE TRAPPED-ION INSTABILITY Ph.D. Thesis
Richard Marchand 1979 197 p
Avail: Univ. Microfilms Order No. 7928481

A fully two dimensional eigenmode analysis of trapped ion instability in an axisymmetric toroidal geometry is discussed. The calculation takes into account the basic dynamics associated with other low frequency modes such as the trapped electron instability and the ion-temperature-gradient instability. The formalism is also applicable to the familiar radially local and one dimensional radiation radial approximations. Results obtained in these limits are represented. The radially local limit is also used to investigate the possible presence of low frequency microinstabilities in the recent neutral-beam heated PLT discharges. In this case, the ion temperature gradients are found to have a strong destabilizing influence, and an ion temperature threshold is computed. For higher shear plasmas, the radial structure of the trapped-ion mode is found to differ considerably from the one-dimensinal approximation. Dissert. Abstr.

N80-16879 California Univ., Berkeley
THE ANNIHILATION MODEL OF THE TORMAC SHEATH Ph.D. Thesis
James Henry Hammer 1979 144 p
Avail: Univ. Microfilms Order No. 8000366

A one dimensional, steady state fluid model is developed to describe the boundary layer between plasma and magnetic field that occurs in the Tormac sheath. The model includes transport across the magnetic field as well as mirror losses along the field, the latter being represented as annihilation terms in the one dimensional equations. The model equations are derived from the two dimensional, time dependent hierarchy of equations generated by taking velocity moments of the kinetic equation including collisions. With the approximations a set of nonlinear ordinary differential equations is generated with independent variable x, the distance across the sheath. The annihilation equations are integrated numerically for a variety of situations: poloidal field reversed and nonreversed sheaths; classical and anomalous collisionality; including or excluding electron wall interactions. The integration yields profiles for density, pressure, flow velocity, magnetic and electric fields as well as the eating in rate of the sheath and the floating electrostatic potential. Dissert. Abstr.

STABILITY OF A TOROIDAL PLASMA BY HOT ELECTRON ANNULUS IN A BUMPY TORUS
H. Sanuki and M. Fujiwara Dec. 1979 18 p refs
(IPPJ-426) Avail: NTIS HC A02/MF A01

The ballooning instability is analyzed in a bumpy configuration using a relatively simple fluid model of an inhomogeneous slab plasma with grativational field simulating the bad curvature effect and the grad-B effect due to hot electron annulus. Mathieu type equation is derived to investigate a linear analysis. Stability boundary giving the maximum stable Beta sub p (beta value of bulk plasma) as a function of Beta sub h and the threshold for Beta sub h (beta value of hot electron annulus) are studied for Nagoya bumpy torus parameters. The relevance of our theoretical analysis is discussed in a comparison with the previous results. J.M.S.

FINITE TEMPERATURE EFFECT OF RAY TRACING NEAR THE ELECTRON CYCLOTRON RESONANCE
M. Tanaka, M. Fujiwara, and H. Ikegami Nov. 1979 26 p refs
(IPPJ-427) Avail: NTIS HC A03/MF A01

Ray trajectories and power absorption of electromagnetic wave propagating in an inhomogeneous plasma are investigated in the frequency region near the electron cyclotron resonance. Plasmas are assumed to be cylindrical with the toroidal effect on magnetic field taken into consideration. Finite temperature effect on ray tracing is studied in detail by applying the geometrical optics to a warm plasma, and it is found that the geometrical optics cannot be applied in the region of the electron cyclotron resonance, where the group velocity does not coincide with the velocity of energy flow. Author

A TWIN OPTICALLY-PUMPED FAR-INFRARED CH3OH LASER FOR PLASMA DIAGNOSTICS
M. Yamanaka, Y. Takeda, S. Tanigawa, A. Nishizawa, N. Noda, M. Shimobayashi, Y. Hayashi, T. Koizumi, K. Nagasaka, S. Okajima et al. Nov. 1979 35 p refs
(IPPJ-428) Avail: NTIS HC A03/MF A01

A twin optically-pumped FIR CH3OH laser composed of two identical waveguide resonators was constructed for the modulated interferometer system to be applied to the JIPP T-2 Tokamak machine. The anti-symmetric doublet due to the Raman-type resonant two-photon transition is reproducibly observed at 118.8 micron m. With the 118.8-micron m line, the frequency separation of the anti-symmetric doublet indicates that the CH3OH absorption line center is 16 - or - 1 MHz higher than the pump 9.7-micron P(36) CO2 laser line center. It is shown that the Raman-type resonant two-photon transition is useful in getting several-MHz phase modulations for the far-infrared laser interferometer. Some preliminary performances of this twin laser for the modulated interferometer are described. A.R.H.

WHISTLER WAVE TRAPPING IN A DENSITY CREST
H. Sugai, H. Niki, M. Inutake, and S. Takeda Nov. 1979 32 p refs

(IPPJ-429) Avail: NTIS HC A03/MF A01

The linear trapping process of whistler waves in a field aligned density crest is investigated theoretically and experimentally below omega = omega sub c/2. The conditions of the crest trapping are derived in terms of the frequency omega/omega sub c, the incident wave normal angle theta sub i, and the density ration n sub i/n sub o. The oscillation length of the trapped ray path for a parabolic density profile is calculated. The phase and amplitude profile of the whistler wave measured along and across the crest is discussed. The experiment on antenna excited whistler wave performed in a large magnetized plasma with the density crest is described. the theory of the crest trapping is presented, bearing the antenna excitation experiments in mind, and the experimental apparatus and method are reported. A.W.H.

PRODUCTION AND DIAGNOSTICS OF DENSE NUCLEAR PLASMAS. Final Report, 1 Sep. - 31 Aug. 1979

Ja H. Lee. Aug. 1979. 81 p. refs.

(Grant NsG-1235)

(NASA-CR-162656) Avail: NTIS HC A05/MF A01 CSCL 20I

Dense nuclear plasmas were produced in devices with three different geometries, namely a Mather-type dense plasma focus (DPF), a hypocycloidal pinch (HGP), and a staged plasma focus (SPF). The basic mechanism common to all three geometries was a strong zeta pinch of the current sheets which was launched from the insulator surface by an inverse zeta pinch. The HCP and the SPF are geometrical variances of the Mather-type plasma focus and have significant advantages over the Mather-type device. R.C.T.

EXPERIMENTS ON H2-O2MHD POWER GENERATION

J. Marlin Smith. 1980. 18 p. refs. Proposed for presentation at the 3d World Hydrogen Energy Conf., Tokyo, 23 - 26 Jun. 1980.

(NASA-TM-81424) Avail: NTIS HC A02/MF A01 CSCL 20I

Magnetohydrodynamic power generation experiments utilizing a cesium-seeded H2-O2 working fluid were carried out using a diverging area Hall duct having an entrance Mach number of 2. The experiments were conducted in a high-field strength cryomagnet facility at field strengths up to 5 tesla. The effects of power takeoff location, axial duct location within the magnetic field, generator loading, B-field strength, and electrode breakdown voltage were investigated. For the operating conditions of these experiments, it is found that the power output increases with the square of the B-field and can be limited by choking of the channel or interelectrode voltage breakdown which occurs at Hall fields greater than 50 volts/insulator. Peak power densities of greater than 100 MW/cu M were achieved. A.R.H.

STABILITY OF THE FIELD-REVERSED MIRROR. Ph.D. Thesis

E. C. Morse. 1979. 109 p. refs.

(Contract EY-76-S-02-2218)

(COO-2218-136) Avail: NTIS HC A06/MF A01

The stability of a field reversed mirror plasma configuration is studied with an energy principle derived from the Vlasov equation. The stability properties of a field reversed mirror are compared with the stability properties of similar magnetohydrodynamic equilibria. The Vlasov energy principle developed is applied to a computer simulation of an axisymmetric field reversed mirror state. Techniques for suppressing instabilities are outlined, and the applicability of the Vlasov energy principle to more complicated equilibrium models is shown. DOE

MIRROR POSITION DISPLAY EQUIPMENT FOR THE TARGET CHAMBER MIRROR MOUNTS OF THE LASL HELIOS LASER FUSION FACILITY
F. D. Wells and D. A. Remington 1979 6 p Presented at the IEEE Region Six Conf., Sacramento, Calif., 25 Apr. 1979
(Contract W-7405-eng-36)
(LA-UR-79-589; CONF-790427-1) Avail: NTIS
HC A02/MF A01

Equipment was fabricated which records the absolute positions of sixteen mirror mounts used to direct and focus eight high-energy laser beams for research in laser induced fusion. Each mirror mount is driven by three stepping motors, controlled to produce the motions of focus, tilt, and rotate relative to the target. Stepping of the motors is sensed by incremental optical encoders coupled to the motor drive shafts. Outputs from the encoder tracks are multiplexed to a microprocessor which transmits motor step information via a fiber optical data link to a mirror position display chassis. This unit accumulates the steps, stores the motor positions, displays mirror positon data to the operator, and provides the equipment control functions. Standby battery power is included to retain the motor step data in the event of power failure. DOE

Computer modeling of short pulse HF chemical lasers is discussed. Disagreements between laser code predictions and short pulse laser experiments are examined. The introduction of treatments for initiation and energy loss mechanisms, and the consideration of initiation nonuniformities are evaluated for reducing uncertainties between code predictions and experimental observations. Areas of work required to reduce the remaining modeling uncertainties are identified. DOE

ASPECTS OF TOKAMAK TOROIDAL MAGNET PROTECTION
R. W. Green and M. S. Kazimi Jul. 1979 198 p refs
(Contract EY-76-S-02-2431)
(COO-2431-6; PFC/TR-79-6) Avail: NTIS HC A09/MF A01

Geometric models were used to estimate the potential for damage to a Tokamak reactor inner wall and blanket due to a toroidal magnet field collapse. The only potential hazard found to exist was due to the MHD pressure rise in a lithium blanket. A survey of proposed protection methods for superconducting toroidal magnets was conducted. Computer programs were developed which allowed the toroidal magnet set to be modeled as a set of circular filaments. A thermal model of the conductor was used which allowed heat transfer to the magnet structure and which included the effect of temperature dependent properties. A protection system design procedure was developed. DOE

PICOSECOND DYNAMICS OF ENERGY TRANSFER IN PURE AND MIXED ORGANIC CRYSTALS Ph.D. Thesis
Dana Donald Dlott 1979 137 p
Avail: Univ. Microfilms Order No. 8001906

Intermolecular interactions in molecular crystals which give rise to electronic excitation transport are studied. Experimental investigations of the wide variety of radiative and radiationless transitions which occur in molecular crystals are discussed. The application of the techniques of picosecond time resolved spectroscopy to the study of radiationless processes including excimer formation, phonon effects, and excited state energy transport is reported. Several observables which depend on excited state mobility are discussed and in particular it is shown that the picosecond transient grating technique permits direct determination of excited state mobility by introducing a well defined distance scale directly in the sample. Dissert. Abstr.

LOW ENERGY ELECTRON DIFFRACTION AND AUGER ELECTRON SPECTROSCOPY STUDIES OF THE STRUCTURE AND CHEMISTRY OF IRON SINGLE CRYSTAL SURFACES Ph.D. Thesis
Clifford Alan Megerle 1979 346 p
Avail: Univ. Microfilms Order No. 8000441

The techniques of low energy electron diffraction and Auger electron spectroscopy were used to study the structure, the Debye temperature and the adsorption behavior of several iron and vanadium single crystal surfaces. Clean Fe(110), Fe(111) and Fe(100) surfaces were obtained after the removal of sulfur impurities by a two step process involving (1) the heating of the sample to a temperature of 850 C in a flowing stream of hydrogen at a pressure of one atmosphere and for a period of approximately four weeks, follwed by (2)several ion bombardment-anneal cycles. Dissert. Abstr.

N80-16903 California Univ., Berkeley.
STUDIES OF ELECTRON CORRELATION IN THE PHOTOIONIZATION PROCESS Ph.D. Thesis
Richard Allen Rosenberg 1979 200 p
Avail: Univ. Microfilms Order No. 8000493

Electron correlation, the interaction of two or more electrons confined in a region of space, was treated under the formalism of configuration interaction (CI). The types of CI involved in the photoionization process was divided into three categories: initial state configuraton interaction, final ionic state configuration interaction, and continuum state configuration interaction. The experimental studies which reveal how the various types of CI may become manifested in photoionization are examined. The experimented methods utilized in the work were photoelectron spectroscopy (PES), electron impact spectroscopy (EIS), and time resolved fluorescence spectroscopy. Dissert. Abstr.

THEORETICAL STUDIES OF BOUND EXCITON DECAY AND OF TRANSPORT ACROSS SEMICONDUCTOR INTERFACES Ph.D. Thesis
Gordon Cecil Osbourn 1979 164 p
Avail: Univ. Microfilms Order No. 7920345

Calculations of the phononless Auger and radiative transition rates for excitons bound to the four common shallow acceptors (B, Al, Ga and In) in Si and Ge are presented. The calculation of radiative transition rates is compared to estimates obtained from absorption experiments. Calculations for the Auger and radiative recombination rates for acceptor bound excitons in the Hg-CdTe alloy system and in GaAs are discussed. Calculations of reflection and transmission coefficients for electrons and holes at abrupt and graded (100) interfaces for the GaAs-Ga sub 1-x Al sub x As system are presented. The calculations are performed using the empirical tight binding approximation. The dependence of the transport coefficients on the alloy composition was investigated. The effect of the distance over which the interface is graded on the transport coefficients was examined. A theoretical study of impact ionization in heterojunction systems is reported. Dissert. Abstr.

N80-16905 North Texas State Univ., Denton.
CO2-LASER INDUCED HOT ELECTRON MAGNETO-TRANSPORT EFFECTS IN n-InSb Ph.D. Thesis
Bradley Thomas Moore, Jr. 1979 204 p
Avail: Univ. Microfilms Order No. 800795

The effects of optical heating via infrared free carrier absorption on the electron magneto-transport properties of n-InSb at helium temperatures was studied. A CO2 laser was used as the optical source. The photoexcited electrons generated by the free carrier absorption were found to relax their excess energy by emitting a maximum number of optical phonons before electron-electron scattering distributed the remaining energy to the bulk conduction band electron gas. The Shubnikov-de Haas (SdH) oscillations in the magnetoresistance were used to monitor the electron temperature. The application of the SdH effect to the study of optical heating is discussed. Dissert. Abstr.

MOSSBAUER MEASUREMENTS ON LOW TEMPERATURE DEUTERON IMPLANTED Al(Co57) Ph.D. Thesis
Tami Louis Marcuso 1979 149 p
Avail: Univ. Microfilms Order No. 8002123

In situ Mossbauer measurements were performed on the dilute alloy Al(Co(57)) following low temperature deuteron implantations obtained from the 2.5 MeV Van de Graaff accelerator. The irradiations produced a satellite absorption resonance in the Mossbauer spectra which was defined as a Lorentzian doublet. The results were compared to other Mossbauer investigations of the same system after low temperature neutron and electron irradiations. A description of the experimental equipment and associated low temperature irradiation performance is presented. The procedure used to make the dilute, substitutional Al(Co(57)) alloy is discussed, and, based on this procedure, a substitutional cosolubility limit was estimated. Mossbauer results concerning coprecipitation from solid solution are presented: the incomplete recovery of the spectra following irradiation is tentatively associated with coprecipitation thermally activated by thermal spike mechanisms. Dissert. Abstr.

N80-16907 Wisconsin Univ. - Madison.
CALCULATION OF LOCAL FIELDS IN CUBIC LATTICES OF POLARIZABLE ATOMS Ph.D. Thesis
Alfred Paul Lehnen 1979 273 p
Avail: Univ. Microfilms Order No. 7927184

The response of cubic lattices of polarizable atoms to static electric fields is treated. A series solution in powers of the polarizability is obtained for the self-consistent dipole-field equations. Two cases are considered in detail, a uniform field and the field of a point charge. For the uniform field, an exact calculation is made for the maximum value of the polarizability for which there exists a solution to the dipole field equations. For the simple cubic lattice, results are obtained which are smaller than the Clausius-Mosotti limit. It is shown that the deviation of the atomic dipole from the continuum result drops exponentially with distance from the crystal surface. A normal mode analysis of an infinite lattice of Drude-model atoms is done to identify the limiting polarizability for more general nonuniform fields. Dissert. Abstr.

N80-16908 Nebraska Univ. - Lincoln.
TESTS OF NEW THEORIES FOR CRYSTAL ANHARMONICITY Ph.D. Thesis
Bruce W. Jones 1979 191 p
Avail: Univ. Microfilms Order No. 8000897

Two theories of crystal anharmonicity were tested. The uncorrelated-pairs approximation (UPA) is used to determine the equilibrium thermodynamic properties of systems with different model potentials. A generalization of the self-consistent phonon (SCP) approximation is developed to treat the problem of a displacive phase transition. Quantum-mechanical corrections and three-body forces were included in the harmonic approximation only, and very good agreement with Monte Carlo results was obtained. The UPA is simple to apply and is more accurate at

high temperatures than the so-called improved self-consistent phonon approximation. Dissert. Abstr.

N80-16909 Texas Univ. at Austin.
DYNAMICS NEAR THE PHASE TRANSITIONS IN LIQUID CRYSTALS Ph.D. Thesis
Khurshid Akhter Hossain 1979 111 p
Avail: Univ. Microfilms Order No. 7928303

A general formalism is developed to study the dynamics near the nematic to smectic phase transitions in liquid crystals. This formalism is cast in such a form that the very successful dynamic renormalization group method can be applied. The contributions to the viscosities which enter the stress tensor in the nematic state of a liquid crystal and the twist viscosity gamma sub 1, for the order parameter fluctuations near the nematic-smectic A, nematic-smectic C transitions and the Lifshitz point are calculated. The parameter which describes the reversible coupling between the shear and the director is also obtained. The calculational scheme involves a mode-coupling method. These results are compared with those of Jahnig and Brochard near the nematic-smectic-A transition. The dynamics of the NA transition is also investigated by the renormalization group method. Dissert. Abstr.

N80-16910 Arizona State Univ., Tempe.
AN INVESTIGATION OF CRYSTAL SURFACE STRUCTURE BY REFLECTION ELECTRON DIFFRACTION Ph.D. Thesis
Gary George Hembree 1979 136 p
Avail: Univ. Microfilms Order No. 8000942

Enhancement of the crystallographic contrast present in scanning electron micrographs formed by the secondary electron output from specimens of pyrolytic graphite was observed at glancing incident beam angles. A program of experimental observations of the angular dependence of the secondary electron image contrast and reflection electron diffusion (RED) patterns was carried out utilizing an instrumental system which combines scanning electron microscopy (SEM) and RED in an ultra high vacuum environment. The experimental results were interpreted with the help of computed RED intensities and Bloch wave extinction depths. These were obtained from a program based on an n beam dynamical electron diffraction formulation. The results of this comparison showed that the enhanced crystallographic contrast originated from variations in the penetration depth of the incident electron beam caused by different azimuthal incidence angles with respect to the crystal lattice. Dissert. Abstr.

N80-16911 Princeton Univ., N. J.
COMPARATIVE LOW ENERGY ELECTRON DIFFRACTION STUDIES OF InSb(110) AND GaAs(110) SURFACES Ph.D. Thesis
Jwu-Lin Yeh 1979 123 p
Avail: Univ. Microfilms Order No. 7928496

The structural search using kinematical calculations of the intensities of normally incident low energy electrons diffracted from InSb(110) and the structural refinement afterwards using dynamical calculations is discussed. A surface structure model revealing InSb(110) top three layer atomic reconstructions through a comparison with the measured intensities is presented. The findings from ELEED analysis on InSb(110) surface are compared with the results of the previous studies of GaAs(110) from different directions such as the characteristics of normal-incidence and CMTA data, the scattering factors of the constituent atoms, the procedure of structure determination, the finally proposed structural parameters, and some other physical properties of these two III-V covalently bonded compound semiconductors. The introduction of an appropriate Debye-Waller factor for a diatomic material and the usefulness of the low temperature LEED intensity data are reported. Dissert. Abstr.

GINZBURG-LANDAU THEORY AND THE SUPERCONDUCTING TRANSITION IN THIN, AMORPHOUS BISMUTH FILMS Ph.D. Thesis
Deborah VanVechten 1979 243 p
Avail: Univ. Microfilms Order No. 8002078

The calculation of the effect of (b/2)((the absolute value of psi) squared) squared on the fluctuation conductivity in three different approximations is presented. The predictions are compared to data on thin amorphous bismuth films. The first approximation calculates the contribution to the fluctuations' self energy of the tadpole diagrams. The values of the theoretical equation's fitting parameters were determined by a least squares method and turn out to depend on film thickness in the manner predicted by the theory. Dissert. Abstr.

N80-16913 Rutgers - The State Univ., New Brunswick, N. J.
SURFACE DEFECTS IN WEAKLY DEFORMED SINGLE CRYSTAL SILICON AND THEIR EFFECT ON INTERFACE PROPERTIES OF MOS CAPACITORS Ph.D. Thesis
Krishna Murty 1979 218 p
Avail: Univ. Microfilms Order No. 7928428

A quantitative correlation is established between the induced stresses and the electronic properties of the MOS capacitor and MOSFET device. X-ray topographic evidence showed that sputtered Ta films induce strain resulting in microplastic defects at the surface of Si wafer as shown on the X-ray section topographs. These defects are most likely caused by incorporation of Ta atoms in Si lattice. Auger electron spectroscopy has shown that implanted Ta atoms diffuse through SiO2 and reach Si surface. Dislocation etching followed by SEM examination verified X-ray topographic evidence of the location of defects on Si surface. Dissert. Abstr.

PLANAR MULTIJUNCTION HIGH VOLTAGE SOLAR CELLS
John C. Evans, Jr., An-Ti Chai, and Chandra Goradia (Cleveland State Univ., Ohio) 1980 10 p refs Presented at 14th Photovoltaic Specialists Conf., San Diego, Calif., 7-10 Jan. 1980; sponsored by IEEE
(NASA-TM-81389; E-299) Avail: NTIS HC A02/MF A01 CSCL 20L

Technical considerations, preliminary results, and fabrication details are discussed for a family of high-voltage planar multijunction (PMJ) solar cells which combine the attractive features of planar cells with conventional or interdigitated back contacts and the vertical multijunction (VMJ) solar cell. The PMJ solar cell is internally divided into many voltage-generating regions, called unit cells, which are internally connected in series. The key to obtaining reasonable performance from this device was the separation of top surface field regions over each active unit cell. Using existing solar cell fabricating methods, output voltages in excess of 20 volts per linear centimeter are possible. Analysis of the new device is complex, and numerous geometries are being studied which should provide substantial benefits in both normal sunlight usage as well as with concentrators. A.R.H.

STRUCTURAL PROPERTIES OF Nb3Sn DIFFUSION LAYERS FABRICATED ON SINGLE CRYSTAL Nb SUBSTRATES M.S. Thesis. Final Report
James Frederick DeBroux 4 Sep. 1979 146 p refs
(AD-A074738) Avail: NTIS HC A07/MF A01 CSCL 13/13

The structural properties of Nb3Sn diffusion layers fabricated on oriented single crystal Nb substrates exhibit systematic behaviors based on substrate orientation which result from interactions between the substrates and A15 overlayers. Preferred orientation of the diffusion layers is confirmed by X-ray and electron diffraction measurements. Within the bulk of a specific Nb(hkl) substrate layer, the preferred orientation appears to be a function of layer thickness for the range of thicknesses studied (or 1 to 17 micrometers). It is believed to develop over distance due to a competition between the growth region orientation at the advancing interface (required by lattice registry of the bcc and A15 lattices) and the tendency of Nb3Sn layers toward a natural growth direction, A15(100); this competition is moderated by in situ annealing of the Nb3Sn as growth advances. Consistent with this model is the fact that surface preferred orientation of a diffusion layer on a given Nb(hkl) substrate, both for as-grown surfaces and for internal surfaces exposed by etching, appears to be a function of net layer thickness. PHONON SCATTERING IN METALLIC GLASSES
J. L. Black. 1979. 9 p. refs. Presented at the 3d Intern. Conf. on Phonon Scattering, Providence, 28 Aug. 1979.
(Contract EY-76-C-02-0016)
(BNL-26610; CONF-790862-3) Avail: NTIS HC A02/MF A01

Theoretical and experimental developments in the study of metallic glasses at temperatures near or below 1K are presented. In this temperature regime, it appears that practically all glasses, whether metallic or insulating, behave in a similar fashion. The fact that such similarities occur, despite substantial structural differences between metallic and insulating glasses, constitutes a major theoretical challenge. The evidence for universal behavior and the theory which is necessary to understand this evidence are emphasized. Most of this evidence involves a comparison of phonon scattering in metallic glasses with its counterpart in insulating glasses. DOE

SURFACE SELF-DIFFUSION OF GERMANIUM AND SILICON
D. M. Makowiecki and J. B. Holt. 11 Jun. 1979. 12 p. refs. Presented at the 5th Intern. Conf. on Sintering and Related Phenomena, Notre Dame, Ind., 18 Jun. 1979.
(Contract W-7405-eng-48)
(UCRL-82865; CONF-790682-4) Avail: NTIS HC A02/MF A01

Surface self-diffusion was investigated by measuring the smoothing of surface profiles on germanium and silicon single crystals. The profiles generally would not change when the crystals were annealed in vacuum. However, removal of oxide films by a reducing atmosphere or flash heating yielded samples that changed their profiles considerably upon annealing. This evidence indicates that surface oxide films are stopping surface diffusion on these crystals. Preliminary data yield values for the surface-diffusion coefficients that are not particularly low when compared with those of metals. However, the data indicate low volume-diffusion coefficients for silicon and germanium, which may contribute to the nonsinterability of these materials. DOE

STATISTICAL MECHANICS AND FIELD THEORY Ph.D. Thesis
Stuart Alan Samuel. 1979. 339 p.
Avail: Univ. Microfilms Order No. 8000504

The application of field theory methods to statistical mechanics is discussed. In particular, statistical systems are related to fermionic like field theories through a path integral representation. The basic definitions, ideas, and uses of anticommuting variables are presented. The Ising model, the free fermion model, and close packed dimer problems on various lattices are considered. Graphical calculation techniques are developed. The application of statistical mechanics intuition to field theories is also discussed. Certain relativistic field theories are shown to be equivalent to classical interacting gases. The problem of quark confinement is addressed. Dissert. Abstr.

N80-16925 California Inst. of Tech., Pasadena.
MATHEMATICAL MODELING AND EXPERIMENTAL STUDIES OF THERMAL REACTIONS OF COAL
Ph.D. Thesis
Ravi Jain 1980 312 p
Avail: Univ. Microfilms Order No. 8000958

A mathematical model based on coal's chemical structure and its reactions is developed for computer simulation pyrolysis. For the purpose of mathematical modeling, coal is considered to be a population of randomly distributed functional groups on a matrix. A scheme based on statistical transformations is devised to compute concentrations of reacting configurations before and during pyrolysis. The rates of reactions are expressed in terms of these concentrations. Differential equations governing the rate of change of state variables with pyrolysis time are formulated and numerically integrated on the computer. The dependence of the yield and composition of volatiles on (1) transport parameters like particle size and pressure, and (2) kinetic parameters like time, temperature and time-temperature history, is investigated. Gaseous products are analyzed using chromatography, while tar is characterized by GPC, NMR, and elemental analysis. Dissert. Abstr.

N80-16926 California Univ., Berkeley.
MOLECULAR THERMODYNAMICS OF DEW-POINT CALCULATIONS IN COAL GASIFICATION PROCESSES
Ph.D. Thesis
Abdalla Ibrahim El-Twaty 1979 205 p
Avail: Univ. Microfilms Order No. 8000333

A flow apparatus for dew point measurements suitable for highly asymmetric mixtures at high temperatures is described. The apparatus was used to measure the vapor pressure of anthracene in the temperature range 145-165 C and the solubility of n-hexadecane in methane at 125 C near 600 psig. A molecular thermodynamic model was developed to predict condensation conditions for coal gases. Fugacity coefficients are calculated from the viral equation for the gas-phase. The model is implemented in the form of a computer program which requires as input: the total pressure, weight fractions of all components of the feed and, for each tar cut, one vapor pressure datum, fraction aromaticity, and hydrogen-to-carbon ratio. The program calculates the initial dew point as well as the mole and weight percent of tar and/or water condensed as the temperature falls along the heat exchanger. Dissert. Abstr.

HIGH-TEMPERATURE THERMODYNAMIC PROPERTIES OF THE THORIUM-OXYGEN SYSTEM
R. J. Ackermann and M. Tetenbaum 1979 25 p refs Presented at the Intern. Colloq. on Mater. for High-Temperature Energy, Toronto, 16 Jul. 1979 and Intern. Symp. on Thermodyn. of Nucl. Mater., Jeulich, West Germany, 29 Jan. - 2 Feb. 1979
(Contract W-31-109-eng-38)
(CONF-790761-1) Avail: NTIS HC A02/MF A01

Thermodynamic properties of the Th-O system at high temperatures were investigated by means of mass effusion, mass spectrometric, and transpiration techniques over compositions ranging from the congruently vaporizing composition to the lower phase boundary composition. A very sharp decrease in O potential occurs when stoichiometric thoria is reduced but slightly from the stoichiometric composition. The small extent of reduction over a wide range of O potentials measured in the temperature range 2400 to 2655 K is a clear illustration of the higher stability of the ThO sub 2-x phase compared with actinide oxides such as UO sub 2-x, PuO sub 2-x, as well as other metal oxide systems. Estimates of delta H-bar sub O27, delta S-bar sub O2, and the standard free energy of formation of bivariant ThO sub 2-x compositions were made. A substantial increase in the total pressure of Th-bearing species occurs when stoichiometric thoria is reduced toward the lower phase boundary. DOE

SOLITON MASSES IN SUPERSYMMETRIC THEORIES
J. F. Schonfeld 1979 32 p refs
(Contract EY-76-C-02-1764)
(COO-1764-363) Avail: NTIS HC A03/MF A01

A systematic mass-calculation procedure derived from the supersymmetry algebra is presented. This method is applied to a large class of two dimensional models, and finds that in O(Dirac constant) the quantum-mechanical mass of a kink differs from its classical mass by a universal expression that has no dependence on the details of the interaction. The difference contains an ultraviolet divergence that exactly cancels the divergence in the classical mass. This contradicts recent claims that the difference must be zero. This result can also be checked using a number of other techniques, but it is argued that in space-times of dimension greater than two only the procedure derived from the supersymmetry algebra is likely to have any practical value. In two dimensions the difference between the quantum and classical masses can be related to properties of the amplitudes with which elementary bosons and fermions are scattered by a kink-antikink pair. These amplitudes satisfy a supersymmetry Ward identity. DOE

N80-16929# Idaho National Engineering Lab., Idaho Falls.
THERPP: A THERMODYNAMIC PROPERTIES PROGRAM
R. S. Deeds Aug. 1979 112 p refs
(Contract EY-76-C-07-1570)
(TREE-1081-Rev) Avail: NTIS HC A06/MF A01

The computer program THERPP, a program that calculates the thermodynamic properties of light hydrocarbons and mixtures of light hydrocarbons, is documented. A specific pressure-temperature or pressure-enthalpy grid is input to obtain properties in the desired region. THERPP is a modification of the program HSGC. Thermodynamic properties are calculated using Starling's modification to the Benedict-Webb-Rubin equation of state. DOE

INTERACTION BETWEEN CLASSICAL AND QUANTUM SYSTEMS: A NEW APPROACH TO QUANTUM MEASUREMENT. 2: THEORETICAL CONSIDERATIONS
T. N. Sherry and E. C. G. Sudarshan 1978 27 p refs
(Contract EY-76-S-05-3992)
(ORO-3992-342) Avail: NTIS HC A03/MF A01

An approach to the quantum measurement process is developed. In this approach, the apparatus is treated as a classical system; however, the classical apparatus is directly coupled to the quantum system. A principle of integrity, which requires that the observables of the classical apparatus retain their classical integrity, is introduced. The constraints that this principle places upon the coupling between the apparatus and the quantum system are examined. A model loosely based on the Stern-Gerlach experiment is used to illustrate the approach. A coupling which satisfies the principle of integrity is exhibited for this model. DOE

INTERACTION BETWEEN CLASSICAL AND QUANTUM SYSTEMS: A NEW APPROACH TO QUANTUM MEASUREMENT. 3: ILLUSTRATION
S. R. Gautam, T. N. Sherry, and E. C. G. Sudarshan 1978 28 p refs
(Contract EY-76-S-05-3992)
(ORO-3992-343) Avail: NTIS HC A03/MF A01

In accordance with the approach to quantum measurement in which the apparatus is treated as a purely classical instrument to be described by the laws of classical mechanics, some simple experiments are examined for the purpose of illustration. The Stern-Gerlach experiment is examined in detail: it is seen explicitly how the relevant information is transferred to the apparatus variables. A magnetic interferometer arrangement and a crossed field arrangement are also examined. Consideration of these experiments leads to the inclusion of an extra procedural step

in the approach. This extra step is necessary so that an observer may measure the classical apparatus variables at will after the interaction is completed. DOE

SCIENTIFIC MANAGEMENT OF THE REPAIRABLE ITEM INVENTORY SYSTEM Final Report
Steven Nahmias 28 Aug. 1979 5 p
(Grant AF-AFOSR-3494-78; AF Proj. 2304)
(AD-A074259; AFOSR-79-0982TR) Avail: NTIS HC A02/MF A01 CSCL 12/1

The purpose of this research was to examine a number of existing mathematical models of repairable inventory systems in order to discover possible improvements and/or generalization of existing work in this area of research. The research resulted in two research reports. One deals with a deterministic model for a repairable item inventory system with a finite repair rate. The second report deals with managing repairable item inventory systems. The second paper presents a relatively comprehensive review of the mathematical models which have appeared in the literature for managing inventory systems where items were subject to repair. It deals with both the continuous review models - METRIC and its extensions and periodic review models which are based on dynamic programming formulations. GRA

LINKING SCIENCE AND TECHNOLOGY TO PUBLIC POLICY: THE ROLE OF UNIVERSITIES
Abdo I. Baaklini, ed. 1979 156 p Prepared in cooperation with State Univ. New York, Albany
(Grant NSF ISP-75-18374)
(PB80-108202; ISBN-0-915194-03-1; LC-78-22608) Avail: NTIS HC A08/MF A01 CSCL 05A

The nature of the relationship between universities and state governments is addressed from both historical and contemporary perspectives. Benefits to be derived by universities and state governments through mutual cooperation and sources of problems that can arise from close relationships between the two are discussed in edited conference papers. The consensus is that increased cooperation between universities and state governments, particularly in the areas of S & T, will prove highly beneficial to both, provided that the arrangements through which this cooperation is achieved are sufficiently flexible to recognize autonomy of the universities. REVIEW OF MANAGEMENT INFORMATION FROM COMPUTER-BASED CIRCULATION SYSTEMS IN ACADEMIC LIBRARIES
C. Mary Overton Jun. 1979 36 p
(BLL-BLRDR-5471; ISBN-0-905984-32-3; ISSN-0308-2385) Copyright. Avail: British Library Lending Div., Boston Spa, Engl.: £3.50

The production and use of management information from computer-based circulation libraries in the United Kingdom are reviewed. Statistical, operational, and analytical information categories are described and the potential usefulness of each type is illustrated. Particular attention is paid to archive files. The management information used in fund allocation loan regulation, book buying, and stock management is briefly described. Factors which detract from the value of management information from automated circulation systems are discussed. K.L.

CONTINGENCY FACTORS AFFECTING THE USER INVOLVEMENT ROLE IN THE DESIGN OF SUCCESSFUL INFORMATION SYSTEMS Ph.D. Thesis
Charles Russel Franz 1979 215 p
Avail: Univ. Microfilms Order No. 8001065

A field survey was conducted to test various contingency hypotheses. Different types of user involvement in designing and implementing information systems were examined along with the resultant success of the information systems to the user. User involvement was studied under various organizational and user conditions to determine the effect which these various conditions has upon user involvement as well as the subsequent user-perceived usefulness of the information system. It was concluded that user involvement is an important variable in producing successful information systems. It was emphasized that more attention should be devoted to developing other measures of user involvement and system's success. Dissert. Abstr.

EXPERIENCE IN USING THE LIBRARIAN AS AN AID IN MANAGING LARGE-SCALE DATA BASES
J. L. Sexton 1978 15 p Presented at the 2nd Librarian User Group Meeting, Atlanta, 6-7 Mar. 1978
(Contract W-7405-eng-26)
(K/CSD/INF-78/4; CONF-780370-1) Avail: NTIS HC A02/MF A01

The storage, maintenance, and retrieval of many data bases varying widely in size (up to 50,000 records) and associated with each other in a variety of subtly implied ways was studied. A system was devised whereby the data are stored on a librarian master file in a highly atomized form and are retrieved and configured at job submission time on the basis of criteria such as work-package structuring, Engineering Department organizational lines, etc. The simplicity and ease-of-use of Librarian enabled implementation of an on-line data base management system and led to higher benchmarks of responsiveness and reliability than were previously possible. DESIGNING INFORMATION: SOME APPROACHES, SOME PROBLEMS AND SOME SUGGESTIONS
Patricia Wright 1979 55 p refs
(BLL-BLRDR-5509) Avail: British Library Lending Div., Boston Spa, Engl.

The problems of characterizing the domain of information design are considered. A range of taxonomic classifications that deal with four aspects of communication are provided; the medium (e.g., print/microform), the text itself (e.g., journal article/catalog card), the readers' interaction with the text (e.g., browsing/studying) and researchers' perspectives on information design (e.g., data collection/theory building). Emphasis is given to the value of studying information users and the category of user is broadened to include both the providers as well as the recipients of messages. Suggestions are made concerning areas where further research effort could be usefully directed. M.M.M.

STATISTICAL BASES OF RELEVANCE ASSESSMENT FOR THE IDEAL INFORMATION RETRIEVAL TEST COLLECTION
H. Gilbert and K. Sparck Jones May 1979 99 p refs Sponsored in part by British Library
(BLL-BLRDR-5481)

The statistical basis of relevance assessment for information retrieval experiments is addressed with special reference to the proposed 'ideal' information retrieval test collection. Statistical arguments, or methods, for establishing what assessment information is required in given circumstances, from which actual procedures for obtaining this information may be derived are considered. The idea and specification of the 'ideal' collection is introduced along with some illustrative data on the relevance properties of various actual test collections. Some of the constraints on any proposed assessment methods and procedures are discussed. Two methods of determining assessment requirements, the 'pool' method and the 'squares' method, are developed in detail. The implications of the methods discussed are considered in terms of procedures for obtaining assessments when building the 'ideal' collection, and in relation to the use of the collection for future experiments. AN EXPERIMENT IN SYNOPSIS PUBLISHING IN THE FIELD OF MECHANICAL ENGINEERING
R. J. Millson Sep. 1979 127 p refs
(BLL-BLRDR-5498; ISBN-0-905984-41-2; ISSN-0308-2385) Copyright. Avail: British Library Lending Div., Boston Spa, Engl.: £10.00

In order to evaluate the concept of synopsis publishing, a subscription journal, Engineering Synopses, was published containing synopses derived from papers accepted for publication in the Proceedings of the IMechE. A regular subscription distribution of some 160 copies of the journal was achieved, augmented by about a further 150 copies distributed to questionnaire recipients, IMechE Committee members, etc. Correspondence with and visits to organizations in academia, industry and elsewhere were undertaken to augment the views of respondents to the questions and to increase the scope of the research by extending it beyond the confines of the disciplines covered by mechanical engineering. Notes are included on the cost effectiveness of the synopsis journal package compared with the traditional journal it might supplant, carrying the same number of titles; copyright implications and the launching of a synopsis journal. Reference is made to the possible future role of synopsis publishing in developing information macro-policies. Particular emphasis is placed on the needs of professional engineers in industry and a role for synopsis publishing in attempting to meet these needs. The prospects of integrating the synopsis journal with centralized on-demand services for full text provision are discussed. M.M.M.

PERSONAL CURRENT AWARENESS SERVICE: A HANDBOOK OF TECHNIQUES FOR MANUAL SDI
T. Whitehall Sep. 1979 124 p refs
(BLRDR-5502; ISBN-0-905984-43-9; ISSN-0306-2385) Avail: British Library Lending Div., Boston Spa, Engl.: £7.00; 16 BLL overseas, 15 European or 40 UK BLL photocopy coupons

Current awareness service to individuals based on scanning material collected by libraries is reported. Methods were taken from the literature and from interviews carried out in academic, special and public libraries. A wide variety of approaches to manual SDI was discovered, with librarians, subject specialists and project workers acting as scanners. Its place alongside other current awareness techniques, including computerised SDI, is discussed. There is a detailed treatment of profiling, scanning and notification techniques. A quality control system is described which is based on criteria identified by clients as being relevant to the value of an SDI service. Organization, promotion and management of SDI are also covered, and an analysis of production techniques produces four basic approaches. M.M.M.

INFORMATION SYSTEMS IN UK AGRICULTURE Final Report
G. M. Craig May 1979 85 p
(BLL-BLRDR-5469; ISBN-0-9505984-33-1; ISSN-0308-2385) Avail: British Library Lending Div. Boston Spa, Engl.: £5.00-10.00; 16 BLL overseas, 15 European or 40 UK BLL photocopy coupons

The complexity of the system(s) which exist in the UK is pointed out in order to convey the findings and applications of agricultural research to agriculturists working in different areas. Increased production and the use of certain forms of information such as review articles, seems potentially important, and new information storage and retrieval systems, utilizing modern technology, offer opportunities for improving the organization and accessibility of existing agricultural literature and data. More user education is necessary to ensure the efficient use of existing information. M.M.M.

ULTRAFILTRATION OF RAW SEWAGE USING AN IMMOBILIZED ENZYME MEMBRANE
Shaw S. Wang, Burton Davidson, and C. Y. Jeng Jul. 1979 32 p refs
(Contract N00014-77-C-0566)
(AD-A074804) Avail: NTIS HC A03/MF A01 CSCL 13/2

Ultrafiltration of raw sewage was performed using multiple-enzymes immobilized on non-cellulosic, ultrafiltration membranes. An increase of 12% in the permeate flux rate at quasi-steady state was observed due to the action of the immobilized enzymes. Enzymes were immobilized by physical sorption to minimize the loss of ultrafiltration capability of the membrane, due to immobilization process. A mathematical model based on diffusive transport and enzymatic action was presented. A standard Marquardt algorithm and a fourth-order Runge-Kutta integration routine were used for estimation of the non-linear parameters in the model. Comparing data presented here to the data reported earlier on the ultrafiltration on NFDM (non-fat, dry milk), it was found that the enzyme-membrane has a longer half-life for the NFDM case than for the raw sewage case. Furthermore, the first-order enzyme decay rate is much faster in the multiple enzyme system used in raw sewage filtration than the single enzyme system used in the ultrafiltration of NFDM. GRA

THE INTERACTION BETWEEN URBANIZATION AND LAND QUALITY AND QUANTITY IN ENVIRONMENTAL PLANNING AND DESIGN: THE PUBLIC INSTITUTIONS MODEL TECHNICAL DOCUMENTATION
Avis C. Vidal and H. James Brown Mar. 1979 48 p refs
(Grant NSF ENV-72-03372)
(PB-301112/9; NSF/RA-780424) Avail: NTIS HC A03/MF A01 CSCL 13B

A model formalizing the decision processes that plan the

size and location of public institutional facilities is presented. The model is worked out in detail for the planning of public elementary and secondary schools. Demand for school facilities is estimated using the sixty household types allocated by the housing model. At the town level, this estimate of demand is used to determine whether new facilities will be built; within towns, the distribution of households is used as a guide in locating new schools. When new facilities are constructed, the associated capital expenditures are used by the fiscal model in determining each town's capital budget and tax rate. These linkages allow the modeling of school construction to be responsive to population changes. GRA

HC A13/MF A01 CSCL 13B

Guidelines are provided in selection, design, and construction of cover for management of municipal, industrial, and hazardous solid wastes (with the exception of radioactive waste). Natural soils as cover are the prinicipal subject; however, synthetic membranes, chemicals, and waste products are also discussed in detail since their relative importance should grow in the future. Each of the important functions of cover is considered in the context of selecting and designing cover but with cognizance of the effects of conflicts that may arise, e.g., between water infiltration and gas venting. A scheme is proposed for establishing functional priorities and in turn for weighting the importance of soil characteristics to allow for most effective selection. Allowance is made for functional conflicts through design features. Procedures are presented for designing soil cover systems to meet the requirements based on principles of soil mechanics and the state of the art in soil construction. Accordingly, this report is not so much a review of current methods as it is a guide to potentially the best practice. GRA

BIOLOGICAL TREATMENT OF HIGH STRENGTH PETROCHEMICAL WASTEWATER Final Report, 20 Feb. 1976 - 23 Sep. 1979
William J. Humphrey and Enrique R. Witt. Aug. 1979. 114 p.
(Grant EPA-12020-EPH)
(PB80-100456; EPA-600/2-79-172) Avail: NTIS
HC A06/MF A01 CSCL 13B

The biological treatment of a complex petrochemical wastewater containing high concentrations of organic chlorides, nitrates, and amines was studied using a sequence of anaerobic methanogenesis and oxygen activated sludge. Only partial removal of chemical oxygen demand (COD) was achieved during anaerobic

denitrification because of the relatively low nitrate/COD ratio. Anerobic methanogenic treatment also was unsuccessful in reducing the COD concentration to any great extent, even after pretreatment by anaerobic denitrification. The activated sludge system was effective in removing the biodegradable portion expressed as biochemical oxygen demand of the pretreated combined wastewater stream; but the yellow color of the effluent was unacceptably dark. WASTEWATER RENOVATION AND RETRIEVAL ON CAPE COD
R. F. Vaccaro, P. E. Kallio, B. H. Ketchum, W. B. Kerfoot, and A. Mann Aug. 1979 193 p refs Prepared in cooperation with Massachusetts Div. of Water Pollution Control, Westborough
(Grant EPA-S-802037)
(PB80-100423; EPA-600/2-79-176) Avail: NTIS HC A09/MF A01 CSCL 02C

Alternative wastewater disposal techniques which promise to maintain high groundwater quality and promote its conservation are considered. An assessment of agricultural spray-irrigation as a potential means of lessening groundwater contamination and depletion is given. Experimental emphasis is placed on variations in the rates and methods of wastewater application and in the types of renovation agricultural crops placed under wastewater irrigation. Results from these studies are promising and suggest that under ideal circumstances, the coupling of secondary domestic effluent to animal forage crops can bring about a degree of wastewater renovation which exceeds direct disposal to sand filter beds and approaches the goals of tertiary treatments. UTILIZATION OF NATURAL ECOSYSTEMS FOR WASTEWATER RENOVATION
Thomas M. Burton, Darrell L. King, Robert C. Ball, and Thomas G. Bahr Apr. 1979 170 p refs
(Grant EPA-Y-005065)
(PB80-100431; EPA-905/3-79-003) Avail: NTIS HC A08/MF A01 CSCL 13B

A facility for the experimental treatment, recycle, and reuse of municipal sewage plant effluents is described. The facility provides for the diversion of secondary effluent from an activated sludge treatment plant. This waste flow is directed away from the receiving stream to an intensely managed aquatic and terrestrial nutrient system. Nutrients are stripped from the waste flow as it proceeds through the system incorporating nutrients into harvestable biomass. Biological activity in the aquatic system has a major impact on water quality as evidenced by significantly reduced water concentrations of phorphorus, nitrogen, and inorganic carbon. GRA

CHARACTERISTICS OF URBAN TRANSPORTATION SYSTEMS: A HANDBOOK FOR TRANSPORTATION PLANNERS Final Report
D. B. Sanders and T. A. Reynen Jun. 1979 196 p refs Prepared in cooperation with Urban Inst. Sponsored in part by FHWA
(Contract DOT-UT-20019)
(PB-301319/0; UMTA-IT-06-004) Avail: NTIS HC A09/MF A01 CSCL 13B

A handbook to be used by transportation planners and urban specialists for estimating system parameters for conventional transportation technology is presented. Three modes are evaluated: rail transit, local bus and bus rapid transit, and highway systems. Each mode contains an assessment of the following seven selected supply parameters: speed, capacity, operating cost, energy consumption, pollutant emissions, capital costs, and accident frequency. GRA

HUMAN SERVICE AGENCY TRANSPORTATION COORDINATION Final Report
James P. Hunter Jun. 1979 101 p refs
(PB-300891/9; DMT-047; Rept-64-120-631060; UMTA-CA-09-8001-79-4) Avail: NTIS HC A06/MF A01 CSCL 13B

The costs of independent special purpose transportation services were compared with the costs of combined transportation services. The feasibility of coordinating existing transit to satisfy the transportation needs of human service agencies in various sized communities was considered. The California Department of Transportation's (Caltrans) study of the feasibility of coordinating human service agency transportation in three areas of California is presented. Cost and ridership data were collected from these agencies by means of inventories, interviews, and questionnaires. The cost data indicated that combined transportation costs are approximately equal to the average of the costs of independent special purpose transportation. GRA

STRONGER FEDERAL DIRECTION NEEDED TO PROMOTE BETTER USE OF PRESENT URBAN TRANSPORTATION SYSTEMS
4 Oct. 1979 71 p
(PB-300974/3; CED-79/126) Avail: NTIS HC A04/MF A01 CSCL 13B

The Federal Highway Administration and Urban Mass Transportation Administration regulations requiring urban areas to develop short-range transportation plans to make better use of present urban transportation systems are discussed. The regulations have not been as effective as they could have been because the two Federal agencies have not administered the regulations consistently, urban areas have not been able to institute planning processes that result in unified plans, and projects that have the most potential for improving the efficiency of existing transportation systems have not been widely adopted. The Secretary of Transportation needs to strengthen Federal administration of the regulations. GRA

THE INTERACTION BETWEEN URBANIZATION AND LAND QUALITY IN ENVIRONMENTAL PLANNING AND DESIGN: THE TRANSPORTATION MODEL TECHNICAL DOCUMENTATION
Michael Tyler and Steve Cummings May 1979 61 p refs
(Grant NSF ENV-72-03372)
(PB-300981/8; NSF/RA-780430) Avail: NTIS HC A04/MF A01 CSCL 13B

The projection of travel demand on transportation facilities is made to provide data for the evaluation of the transportation network and are linked to other models such as fiscal, air and noise. The model is composed of a travel demand and a supply or volume/performance component. The demand submodel projects travel demand between internal zones in the study area and between internal and external zones. The supply model is implemented by adding each projected origin destination pair into the network incrementally and recalculating the network equilibrium after each increment using the least time rule. In this manner, travel demand is allocated over alternative routes as a function of the level of demand. GRA

INTERIOR REISSNER-NORDSTROM BLACK HOLES Ph.D. Thesis
Nelson Arturo ZamoranoHole 1979 130 p
Avail: Univ. Microfilms Order No. 7928372

A scalar wave packet localized at the event horizon, and considered as a small disturbance is able to send waves that after a double scattering sneak into the Cauchy horizon producing unbounded energy densities there. This is a direct consequence of the analytic structure of the reflection and transmission coefficients. It is concluded that the inner horizon is generally unstable in nature. In the Reissner-Nordstrom case, the inclusion of the observed universal microwave radiation is sufficient to produce a great change of the R-N topology at the Cauchy horizon. In dealing with the dynamics of the massless scalar waves in this geometry the radial part of the equations arising by perturbations of a family of black holes (Schwarzschild, Reissner-Nordstrom and Kerr) is a form of the spin-weighted spheroidal wave equation. In other words, the angular part and the radial part of scalar perturbations of the black holes mentioned above obey the same equation. Dissert. Abstr.

N80-16979 Tufts Univ., Medford, Mass.
RADIO ASTRONOMICAL OBSERVATIONS OF REGIONS OF STAR FORMATION Ph.D. Thesis
Robert Frederick Willson 1979 292 p
Avail: Univ. Microfilms Order No. 7920529

The observations of radio wavelength atomic and molecular transitions towards regions of star formation are presented. Radio wavelength measurements and upper limits for CH emission from diffuse interstellar clouds in the direction of nearby bright stars whose optical wavelength spectra exhibit the absorption lines of CH are reported. Line emission from OH and NH3 was detected in the direction of small groups of T Tauri stars and the space between them. Impact broadening was detected in the radio frequency recombination lines emitted by the emission nebular W51 (G49.5 + 0.0) and W49A (G49.2 + 0.0). The search for OH maser emission in the direction of more than eighty infrared stars is discussed along with the detection of twelve new sources of emission. Dissert. Abstr.

N80-16980 California Univ., Los Angeles.
SPECTROPHOTOMETRY OF RING NEBULAE AROUND WOLF-RAYET STARS Ph.D. Thesis
Karen Beth Kwitter 1979 179 p
Avail: Univ. Microfilms Order No. 8001381

Spectrophotometric observations of four ring nebulae surrounding population I Wolf-Rayet stars and four additional filamentary nebulae are analyzed in order to determine the physical conditions and chemical abundances in these objects. It is concluded that the ring nebuale are enriched in nitrogen and helium as a result of contamination of the ambient interstellar medium by the helium- and nitrogen-rich wind from the central Wolf-Rayet star. Two of the additional nebulae are found to be Peimbert Type I planetary nebulae, overabundant in nitrogen and helium due to mixing of CNO processed material into the parent envelope prior to ejection. Two of the remaining objects, a shell around an Oef star and a small H II region around an early Be star, exhibit normal abundances. For two of the ring nebulae, the fraction of nebular mass contributed by the central star from published stellar abundances is estimated. It is found that in these cases, the stellar wind has provided less than 10% of the observed nebular mass. Dissert. Abstr.

N80-16981 California Univ., Berkeley.
LONG TERM VARIATION OF ASTEROID NUTATION Ph.D. Thesis
Richard Paul Henke 1979 115 p
Avail: Univ. Microfilms Order No. 8000375

Asteroids are irregular bodies that are shown to be rotating by the variation in the reflected solar illumination as they rotate. Since they are irregular, the character of their rotational motion is described by specifying the time dependence of the components of their angular velocities along the eigenvectors of their nondegenerate inertia tensors. The results presented are the computation of (1) the time scale for the decay of the residual energy, (2) the rate of the residual energy excitation, and (3) the equilibrium value of the residual energy as function of the asteroid's physical and dynamic parameters and an adopted field asteroid mass and velocity distribution. The amount of nutation is interpreted in terms of its impact on the light curves of the asteroids, which are assumed to be triaxial ellipsoids. Dissert. Abstr.

N80-16982 California Univ., Berkeley.
EUV OBSERVATIONS OF THE LOCAL ISM Ph.D. Thesis
Jay Reynolds Freeman 1979 174 p
Avail: Univ. Microfilms Order No. 8000346

The design, calibration, operation, and data analysis of two spaceborne extreme-ultraviolet photometers, sensitive at the 584 A spectral line of neutral helium, are described. Analysis of data from the first instrument indicates that to two standard deviations, the bulk speed of the local interstellar medium with respect to the Sun exceeds 15 km/s. Data from the second instrument provides a measurement of the number density of neutral helium in the nearby interstellar medium which is smaller than values derived by cruder measurements by a factor of almost three. When this value of the helium number density is interpreted in the context of theoretical models of the interstellar medium, it is concluded that the temperature of the local interstellar radiation field is less than or about equal to 7000 K and that the solar system may lie within the outskirts of an interstellar gas cloud. Dissert. Abstr.

N80-16983 Texas Univ. at Austin.
AN INVESTIGATION OF THE PROPERTIES OF CLOSE MULTIPLE STARS Ph.D. Thesis

Francis Charles Fekel, Jr. 1979 265 p
Avail: Univ. Microfilms Order No. 7928284

Over 350 high dispersion coude plates and coude Reticon observations of 15 close mulitple systems were obtained and measured for radial velocities to determine spectroscopic orbital elements. Multiplicity was discovered or confirmed for six of these systems and nine others were reinvestigated. Use of the solid state Reticon detector produced observations with very high signal-to-noise. As a result, seven spectroscopic components not previously seen with conventional detectors were discovered in these systems. The properties of these 15 systems and 22 others from the literature were compared with the results of numerical studies of the formation of close multiple stars by both fission and fragmentation. The ages of solar type close multiple systems were estimated from lithium abundances of the individual components. The determination of the masses of late type giants is discussed. The masses of two more late type giants were determined using spectroscopic, occultation, speckle, and visual observations. Dissert. Abstr.

N80-16984 Virginia Univ., Charlottesville.
A RADIO SURVEY OF BRIGHT GALAXIES Ph.D. Thesis
Linda Lou Dressel 1979 223 p
Avail: Univ. Microfilms Order No. 8002517

A radio continuum survey of a large apparent magnitude limited sample of galaxies to determine which galactic properties and environments are associated with the occurrence of radio sources is reported. The 2380 MHz system was used to observe all 2095 galaxies in the Uppsala General Catalog of Galaxies brighter than m sub p = 14.5. Twenty two percent of the sources were above the detection limit of 15 mJy. A three element interferometer was used to find flux densities, spectral indices, and positions of dominant compact components in sources stronger than 35 mJy. Dissert. Abstr.

N80-16985 California Inst. of Tech., Pasadena.
A STUDY OF HYDROXYL MASERS IN THE CIRCUMSTELLAR ENVELOPES OF LONG PERIOD VARIABLE STARS Ph.D. Thesis
Menachem Cimerman 1980 91 p
Avail: Univ. Microfilms Order No. 8000956

The problem of the OH mainline masers is investigated by radio observations of two LPV sources with unique OH properties, and by a theoretical analysis. Observations of the OH maser in W Hya are presented, which suggest an explanation of their unique polarization characteristics. The maser lines may be formed at a distance of approximately 1 x 10 to the 14th cm from the stellar surface in the presence of a magnetic field of approximately 1 x 10 to the 9th milligauss. The pumping of OH masers in late type variables by direct stellar radiation of 2.8 microns is studied. Two pumping schemes are suggested based on line coincidences between OH V=0-1 transitions and strong H2O upsilon 3 transitions. The water molecules perturb the stellar radiation by absorption, and thus cool the coinciding OH transition. It is demonstrated that this cooling is capable of producing strong OH masers in the circumstellar envelopes of late type variables. Dissert. Abstr.

RELATIVE ISOTOPIC ABUNDANCES OF ZIRCONIUM IN S-TYPE STARS Ph.D. Thesis
Alma Claire Zook 1978 82 p
Avail: Univ. Microfilms Order No. 8000589

The relative abundances of the six stable or nearly stable isotopes of zirconium were measured for three S stars, R Cyg, V Cnc, and R Gem. The method of analysis is described with the abundances determined by comparing the observed stellar profile of intensity vs wavelength with synthetic spectra calculated by the Minnaert interpolation scheme for a single slab LTE stellar atmosphere. The presence of the long lived unstable isotope Zr-93 supports the hypothesis that nucleo-synthesis is taking place in the S stars, while the absence of the r-process isotope Zr-96 supports the hypothesis that the s process is the mechanism responsible for this nucleosynthesis. Dissert. Abstr.

N80-16992 California Univ., Berkeley.
HETERODYNE SPATIAL INTERFEROMETRY OF CIRCUMSTELLAR DUST SHELLS AT A WAVELENGTH OF 11 MICRONS Ph.D. Thesis
Edmund Charles Sutton 1979 179 p
Avail: Univ. Microfilms Order No. 8000532

The spatial distribution of the 11 micron thermal emission from circumstellar dust envelopes was studied using an infrared heterodyne interferometer. The spatial distribution of silicate grain emission was measured to probe the temperatures and densities of the circumstellar material and thereby to gain an understanding of the structures of circumstellar envelopes. The interferometer used consists of two separate telescopes, each of which is associated with a heterodyne receiver. Among the sources which were observed with this interferometer are alpha Orionis, o Ceti, VY Canis Majoris, and IRC +10216. The 11 micron brightness distributions of these objects all have spatially extended dust emission components. Other significant observations and results are reported. Dissert. Abstr.

N80-16993 Maryland Univ., College Park.
KINEMATICS OF H1 NEAR THE GALACTIC CENTER Ph.D. Thesis
Rameshwar Prasad Sinha 1979 162 p
Avail: Univ. Microfilms Order No. 8002062

The results of a survey of 21 cm line emission in Milky Way Galaxy from 360 deg to 11 deg longitude and from -2 deg to +2 deg latitude are presented. These data along with other published data are used in the derivation of a rotation curve for the Galaxy inside the solar circle (radius 10 kpc). The rotation curve is used to derive a mass model consisting of three components, viz., a nuclear spheroid, a spherical bulge, and a general galactic disk. The symmetry properties of the distribution of H1 in the region around the galactic center are explored. Inside a radius of 1 kpc the H1 appears to be distributed in the shape of an elongated noncircular slowly rotating disk which is inclined to the galactic equator. The velocity dispersion of the H1 distribution in the central elongated disk is examined. Dissert. Abstr.

N80-16994 California Univ., Santa Cruz.
MASS LOSS FROM CATACLYSMIC VARIABLE SECONDARIES Ph.D. Thesis
Ronald Lynn Gilliland 1979 72 p
Avail: Univ. Microfilms Order No. 8002209

Computer simulations of mass loss from cataclysmic variable star secondaries are discussed. The calculations involve solution of the nonlinear hydrodynamical equations of stellar structure under varying degrees of approximation in an attempt to determine stability of the mass loss process. Evolutionary sequences treating only the region near the Lagrangian point were constructed in a manner consistent with the assumption of Roche geometry. The effects of mass flow nonorthogonal to the Roche equipotential surfaces were examined. Dissert. Abstr.

N80-16995 California Univ., Santa Cruz.
H 2 REGION-LIKE GALAXIES Ph.D. Thesis
Howard Bradley French 1979 77 p
Avail: Univ. Microfilms Order No. 8002208

Line fluxes in the region 3700 - 7100A are presented for 14 galaxies with strong, sharp, H 2 region like emission lines. Ratios of the line fluxes are used to derive electron temperatures and densities, and the abundances of helium, oxygen, nitrogen, neon and sulfur relative to hydrogen. The galaxies are found to be photoionized by hot main sequence stars. The velocity dispersion was measured for one object; the mass of stars derived for it was several times smaller than the mass of neutral hydrogen which was previously found in an extened halo around this object. Galactic chemical evolution was investigated through a comparison of the relative abundances in these galaxies with their normal values. Dissert. Abstr.

ATLAS OF MARS: THE 1:5000000 MAP SERIES
R. M. Batson, P. M. Bridges, and J. L. Inge 1979 154 p refs Prepared in cooperation with Geol. Surv., Flagstaff, Ariz.
(NASA Order W-13709; NASA Order WO-8122; NASA Order W-13687; NASA Order L-55232)
(NASA-SP-438; LC-79-600164) Avail: SOD HC $7.00 as NAS1.21:438 CSCL 03B

Small-scale maps and photomosaics covering the entire surface of the planet Mars are presented. The cartographic contents are reduced-scale versions of the 1:5,000,000 topographic series of 30 quadrangles compiled by the U.S. Geological Survey in cooperation with NASA. Most of the quadrangles were compiled with data from the Mariner 9 spacecraft, gathered in 1972. A few sheets, however, incorporated information derived from the two Viking Orbiter spacecraft from 1976 through 1978. Several versions of each quadrangle are shown. These versions include the controlled photomosaics from which final map products were derived, airbrushed shaded relief maps based on the photomosaics and on a variety of special computer enhancements of pictures not included in the mosaics, shaded relief maps with overprints of albedo markings derived by special enhancements of selected Mariner 9 images and contour maps derived from a wide variety of nonimage data ranging from Earth-based radar to remote sensing instruments on the Mariner 9 spacecraft. Discussions of mapping procedures and a gazeteer of feature nomenclature on Mars are included in appendices. A.R.H.

LUNAR MAGNETISM AND PLASMA INTERACTIONS Ph.D. Thesis
Howard Weiss 1979 103 p

Avail: Univ. Microfilms Order No. 8001419

The nature and origin of distinct magnetic signatures observed from lunar orbit are examined. A comparison of the dayside lunar magnetic measurements of the Apollo subsatellites with simultaneous interplanetary measurements reveals an enhancement of the lunar compressional fluctuations when the lunar measurements were taken below 100 km altitude. The most probable source of these low altitude fluctuations appears to be the interaction of the solar wind with anomalous magnetic fields on the moon's surface. The possibility of cratering of the lunar surface as the source of both the anomalous magnetic fields and weak dipole field of the moon is explored. It is found that the present upper limit of a lunar dipole moment can be approximated by the cratered shell model if the 17 largest lunar craters and a reasonable level of magnetization of the crust are used. Nevertheless, it appears that the anomalous magnetic fields presently observed on the lunar surface are not directly a consequence of cratering of an internally magnetized crust.

NOBLE-GAS-RICH SEPARATES FROM ORDINARY CHONDRITES Ph.D. Thesis

Robert Keith Moniot 1979 75 p

Avail: Univ. Microfilms Order No. 8000447

Acid resistant residues were prepared by HCl-HF demineralization of three H-type ordinary chondrites. These residues were found to contain a large proportion of the planetary type trapped Ar, Kr, and Xe of the meteorites. The similarity of these acid residues to those from carbonaceous chondrites and LL type ordinary chondrites suggests that the same phase carries the trapped noble gases in all these diverse meteorite types. Because the H group represents a large fraction of all meteorites, this result indicates that the gas rich carrier phase is as universal as the trapped noble-gas component itself.

NARROW-BAND JOVIAN KILOMETRIC RADIATION: A NEW RADIO COMPONENT

Michael L. Kaiser and M. D. Desch Jan. 1980 16 p refs Submitted for publication

(NASA-TM-80626) Avail: NTIS HC A02/MF A01 CSCL 03B

A new component of Jupiter's radio spectrum is investigated. The component emits in a very narrow bandwidth (less than or equal to 40 kHz) near 100 kHz. Its waveform is a very smooth and gradual rise and subsequent fall in intensity, usually over two hours. The emission is polarized with left hand polarization associated with the Jovian northern magnetic hemisphere and right hand with the south. The emissions deviation from a strict system 3 rotation period repetition rate is examined. The emission source of the narrow band component which rotates 3 to 5 percent slower than all other forms of Jovian radio emission is determined from propagation considerations, coupled with the observed lack of corotation, to a source region near the equatorial plane at the outer edge of the Io plasma torus. The narrow band KOM (nKOM) form is examined using observations from the PRA instrument. The spectrum and occurrence statistics are described and contrasted with the tapered or broadband KOM (bKOM) characteristics.

THE OCCURENCE RATE, POLARIZATION CHARACTER AND INTENSITY OF BROADBAND JOVIAN KILOMETRIC RADIATION

M. D. Desch and M. L. Kaiser Jan. 1980 26 p refs Submitted for publication

(NASA-TM-80627) Avail: NTIS HC A03/MF A01 CSCL 03B

The major observational features of one new component of Jupiter's radio emission spectrum, the broadband kilometer-wavelenth radiation or bKOM are described. The Voyager planetary radio astronomy experiments reveal that the overall occurrence morphology, total power, and polarization character of bKOM are strong functions of the latitude and/or local time geometry of the observations. The post-encounter data show a decline in the mean occurrence rates and power level of bKOM and, in particular, a depletion in the occurrence rate at those same longitudes where the detection rate is a maximum before encounter. Additionally, the polarization sense undergoes a permanent reversal in sign after encounter, whereas the time-averaged wave axial ratio and degrees of polarization remain relatively unchanged. No evidence of any control by Io is found. The strong dependence of the morphology on local time suggests a source whose beam is nearly fixed relative to the Jupiter-sun line.

THE STRATIGRAPHIC SEQUENCE OF VOLCANIC AND SEDIMENTARY UNITS IN THE NORTH POLAR REGION OF MARS

Michael E. Botts Jan. 1980 69 p refs

(NASA-TM-78254) Avail: NTIS HC A04/MF A01 CSCL 03B

Based on photogeologic mapping of Viking orbiter images of Mars, four distinct informal stratigraphic units are defined for the region north of 70 degrees N latitude. They are: (a) bulbous plains, (b) mantled plains, (c) dune deposits, and (d) layered deposits/perennial ice. Background information on the Martian polar caps is provided from telescopic observation, Mariner mission results, and Viking mission results (August 1976-November 1978). A description, and an interpretation and distribution of the stratigraphic units are presented. Surface winds, which were determined from dune orientations, and discussed and implications for the source of circumpolar dune materials are delineated. A list of the Viking Orbiter imagery used in the research, the computer programs for crater size frequency distributions, and the crater size frequency data are presented.

(Contract NASw-3198)
(NASA-TM-75349) Avail: NTIS HC A02/MF A01 CSCL 03B

The effect of solar flares on the weather on Earth is examined. It is concluded that the processes which arise in the atmosphere are so intricate that a single calculation of solar activity is insufficient for long-range forecasting. However, combined consideration of processes dependent upon the dynamic instability of the atmosphere and the effect of solar activity will contribute to the improvement of long-range forecasts. ENERGY RELEASE IN SOLAR FLARES. PROCEEDINGS OF THE WORKSHOP ON ENERGY RELEASE IN FLARES
David M. Rust and A. Gordon Emslie Jul. 1979 73 p refs Workshop held at Cambridge, Mass. 26 Feb. - Mar. 1979 Prepared in cooperation with Am. Sci. Eng., Inc., Cambridge, Mass. and Harvard-Smithsonian Center for Astrophysics, Cambridge, Mass.
(PB-300905/7; UAG-72; NOAA-79081307) Avail: NTIS HC A04/MF A01 CSCL 03B

Parallel meetings of three small teams were held where theories of thermalization, particle acceleration, and mass motion in flares were discussed. An overview of the major scientific issues identified for the study of energy release in flares is given. More specific discussions of the three program areas are included. The concepts of Joint Observing Sequences and Collaborative Observing Sequences (COSs) developed by NASA's Solar Maximum Mission investigators are explained. Specific observations needed for each COS are listed. GRA

ENERGY SPECTRA OF COSMIC RAY NUCLEI TO ABOVE 100 GeV/NUCLEON
M. Simon (Max Planck Inst. fuer Extraterrestriche Physik, West Germany), H. Spiegelhauer (Max Planck Inst. fuer Extraterrestriche Physik, West Germany), W. K. H. Schmidt (Max Planck Inst. fuer Extraterrestriche Physik, West Germany), F. Siohan, J. F. Ormes, V. K. Balasubrahmanyan, and J. F. Arens Oct. 1979 43 p refs Submitted for publication
(NASA-TM-80587) Avail: NTIS HC A03/MF A01 CSCL 03B

The chemical composition cosmic rays as a function of energy in the range of a few GeV/nucleon to some hundreds of GeV/nucleon for boron through iron are presented. The experiment combined an ionization spectrometer and a gas Cherenkov counter, which was flown on a balloon, to perform two different and independent energy measurements. The experimental apparatus is described in detail. The energy dependence of the cosmic ray escape length for boron and iron is reported and predicted changes in the energy dependence of the ratios of primary nuclei O/C and iron/C - O are discussed. STUDY OF ENERGETIC ELECTRONS IN THE OUTER RADIATION-BELT REGIONS USING DATA OBTAINED BY THE LLL SPECTROMETER ON OGO-5 IN 1968
H. I. West, Jr., R. M. Buck, and G. Davidson (Lockheed Missiles and Space Co., Palo Alto, Calif.) 26 Jul. 1979 84 p refs
(Contract W-7405-eng-48)
(UCRL-52807) Avail: NTIS HC A05/MF A01

An account is given of measurements of electrons made by the LLL magnetic electron spectrometer (60 to 3000 keV in seven differential energy channels) on the Ogo-5 satellite in the

earth's outer-belt regions during 1968 and early 1969. The data were analyzed specifically to determine pitch-angle diffusion lifetimes as a function of energy in the L-range 2 to 5. As a part of this effort, the general dynamics of these regions were studied in terms of the time dependent energy spectra, and pitch-angle distrubtion for the seven energy groups were obtained as a function of L wtih representative values presented for L = 2.5 to 6. The pitch-angle-diffusion results were used to analyze the dyanmics of the electrons injected following the intense storms on October 31 and November 1, 1968, in terms of radial diffusion. The derived diffusion coefficients provide a quite reasonable picture of electron transport in the radiation belts. Both the radial-and pitch-angle-diffusion results are compared with earlier results.

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

[AD-A076375] N80-16034
Summary of theoretical and experimental investigations of vortex lift at high angles of attack
[AD-A074483] N80-16037
Parameter identification of flexible flight vehicles assuming a low-reduced-frequency aerodynamic representation N80-16054

AERODYNAMIC COEFFICIENTS
A comparison of calculated and experimental lift and pressure distributions for several helicopter rotor sections
[NASA-TM-81160] N80-16036
Instrumentation modeling technique used in the identification of aerodynamic coefficients from flight test data
[SAND-78-0721C] N80-16038
Aerodynamic coefficient estimation by means of an extended Kalman filter --- to study dynamic models of reentry vehicle motion
[SAND-79-0411C] N80-16039

AERODYNAMIC DRAG
A study of aerodynamic methods for improving truck fuel economy
[PB80-101272] N80-16040

AERODYNAMIC HEATING
Evaluation of use of MPAD trajectory tape and number of orbit points for orbiter mission thermal predictions
[NASA-TM-80946] N80-16081
Aerodynamic heating of high-speed flywheels in low-density environments
[SAND-78-0957] N80-16548

AERODYNAMIC LOADS
Means for controlling aerodynamically induced twist --- equipment to control twisting of slender wings due to aerodynamic loads
[NASA-CASE-LAR-12175-1] N80-16055
Expanded study of feasibility of measuring in-flight 747/JT9D loads, performance, clearance, and thermal data
[NASA-CR-159717] N80-16063
Accuracy of hydrofoil loading predictions obtained from a lifting-surface computer program
[AD-A074702] N80-16233

AERODYNAMIC NOISE
Space shuttle solid rocket booster aft skirt reentry noise induced by an aerodynamic cavity-flow interaction N80-16203

AERODYNAMIC STABILITY
Maximum likelihood identification of aircraft parameters with unsteady aerodynamic modelling N80-16027

AERODYNAMICS
Aeronautical Engineering: A continuing bibliography, supplement 116
[NASA-SP-7037(116)] N80-16023

Fiscal year 1979 scientific and technical reports, articles, papers and presentations
[NASA-TM-78250] N80-17014

AEROELASTICITY
Parameter identification of flexible flight vehicles assuming a low-reduced-frequency aerodynamic representation N80-16054

AERONAUTICAL ENGINEERING
Aeronautical Engineering: A continuing bibliography, supplement 116
[NASA-SP-7037(116)] N80-16023
Fiscal year 1979 scientific and technical reports, articles, papers and presentations
[NASA-TM-78250] N80-17014

AEROSOLS
Fine particle emissions information system
[PB80-100449] N80-16588

AEROSPACE ENGINEERING
A directory of computer software applications: Space technology
[PB-296039/1] N80-16956

AEROSPACE ENVIRONMENTS
Manufacturing in space. Citations from the International Aerospace Abstracts data base --- bibliographies
[NTIS/PS-79/1053/2] N80-16074
Thermodynamic considerations in the support of life for long space voyages
[NASA-CR-162755] N80-16738

AEROSPACE MEDICINE
Aerospace Medicine and Biology: A continuing bibliography with indexes supplement 201
[NASA-SP-7011(201)] N80-16724

AEROSPACE TECHNOLOGY TRANSFER
Prosthetic device for correction of urinary incontinence
[NASA-TM-78255] N80-16739
Space benefits: The secondary application of aerospace technology in other sectors of the economy
[NASA-CR-162697] N80-16950

AFRICA
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16706
Coastal upwelling ecosystems analysis. Nitrate reductase activity in the North West African upwelling area
[PB-301030/3] N80-16707

AGING (MATERIALS)
Stability studies of coal liquids
[PETC/TR-79/5] N80-16129

AGRICULTURE
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400
NCSL remote sensing project --- State Legislature considerations and activities
[E80-10053] N80-16401
Solar energy for agriculture: Review of research
[PB-298688/3] N80-16568
Solar powered agricultural irrigation pumping
[PB-299294/9] N80-16570
Information systems in UK agriculture
[BLL-BLRDR-5469] N80-16948

AIR COOLING
Addition of an air-cooled collector test capability to the solar collector test facility
[PB-300482/7] N80-16562

AIR CUSHION LANDING SYSTEMS
JEFF(A) mixed-flow model fan performance optimization
[AD-A074571] N80-16234

AIR JETS
Design, fabrication and testing of the air-jet oil boom
[PB80-102635] N80-16593

AIR POLLUTION
Air pollution from aircraft
[NASA-CR-159712] N80-16060
Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 2
[PB-299384/8] N80-16193
Environmental development plan: Underground coal gasification
[DOE/EDP-0047] N80-16411
Status of pollutant removal technology for coal fired plants in the northeastern U.S.
[BNL-51004] N80-16580
Trace organic compounds in the New York City atmosphere. Part 1: Preliminary studies
[EPRI-EA-1121] N80-16582
HAOS quality assurance final report: Criteria pollutants, volume 1
[PB-299639/5] N80-16583
HAOS quality assurance: Non-criteria pollutants, volume 2
[PB-299640/3] N80-16584
A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 1: Model formulation
[PB-300470/2] N80-16585
A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 2: User's manual
[PB-300471/9] N80-16586
Fine particle emissions information system
[PB80-100449] N80-16588
Oxidant air pollution impact to the forests of eastern United States: A literature review
[PB80-103500] N80-16589
Air quality data for nonmetallic inorganic ions: NH4+, NO3-, SO4= from the National Air Sureveillance Networks, 1976
[PB-300458/7] N80-16599
Remote sensing of sulfur dioxide effects on vegetation - photometric analysis of aerial photographs
[PB-300460/3] N80-16600
Environmental assessment of stationary source NOx control technologies
[PB-300469/4] N80-16601
A review of standards of performance for new stationary sources: Petroleum refineries
[PB-300480/1] N80-16602
Development of an SO2 monitor for mobile sources
[PB80-100472] N80-16606
Atmospheric reaction products of organic compounds
[PB-301384/4] N80-16610
Weekend/weekday differences in oxidants and their precursors
[PB-300479/3] N80-16612
Inventory of sources with emissions of 25 to 100 tons per year subject to organic material regulations in Metropolitan Boston AQCR
[PB-301242/4] N80-16613
Continuous air pollution source monitoring systems
[PB-300930/5] N80-16615
Evaluation of stationary source particulate measurement methods. Volume 3: Gas temperature control during method 5 sampling
[PB-300336/5] N80-16616
Potential production and marketing of FGD byproduct sulfur and sulfuric acid in the US (1983 projection)
[PB-299205/5] N80-16617
Guidance for selecting TSP episode monitoring methods
[PB-298459/9] N80-16618

AIR QUALITY
Summary of aircraft results for 1978 southeastern Virginia urban plume measurement study of ozone, nitrogen oxides, and methane
[NASA-TM-80146] N80-16575
Altitude characteristics of selected air quality analyzers
[NASA-CR-159165] N80-16578
HAOS quality assurance final report: Criteria pollutants, volume 1
[PB-299639/5] N80-16583
Balancing the objectives of clean air and economic growth: Regulated markets in emission reductions
[PB-300835/6] N80-16598
Impact of air quality control measures
[PB-301234/1] N80-16605
An analysis of alternative policies for attaining and maintaining a short-term NO2 standard
[PB80-100530] N80-16608
The maximum likelihood approach to probabilistic modeling of air quality data
[PB80-104110] N80-16609
The Environmental Protection Agency four corners ambient air monitoring network
[PB80-103559] N80-16614

AIR SAMPLING
The Environmental Protection Agency four corners ambient air monitoring network
[PB80-103559] N80-16614
Continuous air pollution source monitoring systems
[PB-300930/5] N80-16615
Evaluation of stationary source particulate measurement methods. Volume 3: Gas temperature control during method 5 sampling
[PB-300336/5] N80-16616
Guidance for selecting TSP episode monitoring methods
[PB-298459/9] N80-16618

AIR TRAFFIC CONTROL
Air traffic control/full beacon collision avoidance system, Knoxville simulation
[AD-A074555] N80-16043
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 1: Principles of operation
[AD-A074542] N80-16044
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 2: Appendices to the principles of operation
[AD-A074482] N80-16045
Evaluation of the potential for reduced longitudinal spacing on final approach
[AD-A076434] N80-16049
Report of the FAA task force on aircraft separation assurance. Volume 1: Executive summary
[AD-A075352] N80-16050

AIR TRANSPORTATION
Possible markets for dirigibles
[NASA-TM-75937] N80-16042
Safety of liquid hydrogen in air transportation
[LA-UR-79-1416] N80-16236

AIRBORNE EQUIPMENT
Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218
Summary of aircraft results for 1978 southeastern Virginia urban plume measurement study of ozone, nitrogen oxides, and methane
[NASA-TM-80146] N80-16575

AIRCRAFT CONFIGURATIONS
Investigation of ground effects on large and small scale models of a three fan V/STOL aircraft configuration
[NASA-CR-152240] N80-16030

AIRCRAFT CONSTRUCTION MATERIALS
Effect of temperature on composite sandwich structures subjected to low velocity impact --- aircraft construction materials
[NASA-CR-162718] N80-16103
Composite components under impact load and effects of defects on the loading capacity --- Alpha Jet tail assembly
[NASA-TM-75351] N80-16104

AIRCRAFT DESIGN
Technological forecasting-aircraft design. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/1017/7] N80-16057

AIRCRAFT ENGINES
Titanium combustion in turbine engines
[AD-A075657] N80-16059
Air pollution from aircraft
[NASA-CR-159712] N80-16060
Some considerations of the performance of two honeycomb gas path seal material systems
[NASA-TM-81398] N80-16143

AIRCRAFT LANDING
Design considerations for attaining 200-knot test velocities at the aircraft landing loads and traction facility
[NASA-TM-80096] N80-16071

AIRCRAFT MAINTENANCE
Ground run-up noise control facilities for civil aircraft: A survey
[AD-A075348] N80-16067

AIRCRAFT NOISE
Research plan for establishing the effects of time varying noise exposures on community annoyance and acceptability
[NASA-CR-159197] N80-16577

AIRCRAFT RELIABILITY
An evaluation of the ADINA finite element program for application to aircraft overpressure vulnerability
[AD-A074261] N80-16056
AIRCRAFT SAFETY
Novel approaches for alleviation of electrical hazards of graphite-fiber composites — aircraft safety
[NASA-CR-162683] N80-16100
AIRCRAFT STRUCTURES
Application of random time domain analysis to dynamic flight measurements — B-1 aircraft
N80-16226
AIRFOILS
Development of panel methods for subsonic analysis and design
[NASA-CR-3234] N80-16033
Research on the flutter of axial turbomachine blading
[AD-A074597] N80-16064
AIRFRAMES
Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218
AIRPORTS
Air traffic control/full beacon collision avoidance system, Knoxville simulation
[AD-A074555] N80-16043
Ground run-up noise control facilities for civil aircraft: A survey
[AD-A075348] N80-16067
Shrinkage-compensating cement for airport pavement, phase 2
[AD-A075739] N80-16197
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16677
AIRSHIPS
Possible markets for dirigibles
[NASA-TM-75937] N80-16042
ALASKA
Water resources data of the Seward area, Alaska
[PB80-101298] N80-16418
ALBEDO
Solar altitude effects on ice Albedo
[PB-301252/3] N80-16440
ALCOHOLS
Alcohol fuels. Citations from the American petroleum institute data base — a bibliography with abstracts
[NTIS/PS-79/0911/2] N80-16195
ALDEHYDES
Energy dispersion and relaxation in propynal using laser IR/visible double resonance
[COO-4695-2] N80-16381
ALGAE
The distribution and seasonality of the benthic aquatic macrophytes of the Pamlico River estuary, North Carolina
[PB-300496/7] N80-16710
ALGEBRA
Fast algorithms for solving path problems
[AD-A074079] N80-16806
NCMART: Algorithms and computer codes for a modified algebraic spatial reconstruction of spectroscopic emissivities for ELMO bumpy torus
[ORNL/TM-6500] N80-16896
Soliton masses in supersymmetric theories
[COO-1764-363] N80-16928
ALGORITHMS
Fast algorithms for NP-hard problems which are optimal or near-optimal with probability one
N80-16756
Formalizing the analysis of algorithms N80-16758
Constructive extension and implementation of abstract data types and algorithms N80-16759
A variable metric algorithm for the solution of the singular three-dimensional missile avoidance
[TAE-353] N80-16765
Computing region moments from boundary representations
[NASA-CR-162685] N80-16767
Some N by DN linear complementarity problems solvable by a principal pivoting algorithm with applications
[AD-A073929] N80-16772
Consistent nonparametric estimation of best linear classification rules/solving inconsistent systems of linear inequalities N80-16797
Fast algorithms for solving path problems
[AD-A074079] N80-16806
Using SETS to find minimal cut sets in large fault trees
[SAND-78-1943C] N80-16809
Computation of Hankel transforms using the fast-Fourier transform algorithms
[PB80-104045] N80-16812
Interactive solution of multicriterion zero-one variable problems with uncertain information N80-16823
NCMART: Algorithms and computer codes for a modified algebraic spatial reconstruction of spectroscopic emissivities for ELMO bumpy torus
[ORNL/TM-6500] N80-16896
ALKYL COMPOUNDS
Perfluoroether triazine elastomers
[NASA-CR-162748] N80-16166
ALL SKY PHOTOGRAPHY
Time-lapse sky photography using low cost camera systems
[PB-300406/8] N80-16669
ALLOYS
Standard reference materials: Micro-homogeneity studies of NBS standard reference materials, NBS research materials, and other related samples
[PB-300461/1] N80-16135
The effects of strain rate and strain history on the dynamic behavior of metallic materials N80-16140
ALLUVIUM
Hydrologic data on channel adjustments, 1970 to 1975, on the Rio Grande downstream from Cochiti Dam, New Mexico, before and after closure
[PB-301134/3] N80-16425
ALPHA JET AIRCRAFT
Composite components under impact load and effects of defects on the loading capacity — Alpha Jet tail assembly
[NASA-TM-75351] N80-16104
ALPS MOUNTAINS (EUROPE)
Use of solar energy for the production of electricity in the Alps
[SAND-79-6000] N80-16499
ALTIMETERS
The role of satellite altimetry in climate studies
[NASA-TP-1570] N80-16676
ALTITUDE
Attitude characteristics of selected air quality analyzers
[NASA-CR-159165] N80-16578
ALUMINUM
Scanning-electron-microscope study of normal-impingement erosion of ductile metals
[NASA-TP-1609] N80-16141
Aluminum ion-containing polyimide adhesives — bonding temperature resistant materials
[NASA-CASE-LAR-12640-1] N80-16164
Energy and materials flows in the fabrication of aluminum products
[ANL/CNSV-3] N80-16237
Acoustic emission generated in unflawed 7075-T651 aluminum under uniform biaxial loading
[UCRL-81030] N80-16382
Mossbauer measurements on low temperature deuteron implanted Al(Co57) N80-16906
ALUMINUM ALLOYS
Illustration of ternary diagram synthesis-Mn-Ti-Fe and Al-Ti-Fe
[BNL-26392] N80-16153
ALUMINUM OXIDES
Improving the voltage holdoff performance of alumina insulators in vacuum through quasimetallizing
[GEPP-TIS-441] N80-16285
AMBIPOLAR DIFFUSION
Hydrodynamic equilibrium of plasma in an ambipolar trap
[UCRL-TRANS-11493] N80-16887
AMMONIA
Aqueous ammonia equilibrium - tabulation of percent un-ionized ammonia
[PB80-103518] N80-16132
AMMONIUM COMPOUNDS
Air quality data for nonmetallic inorganic ions: NH4+, NO3-, SO4= from the National Air Surveillance Networks, 1976
[PB-300458/7] N80-16599
AMORPHOUS MATERIALS
Computer modelling of amorphous materials for photovoltaic conversion
[DOE/TIC-10185] N80-16536
Phonon scattering in metallic glasses
[BNL-26610] N80-16917
ANAEROBES
Anaerobic biological treatment of liquid wastes from pyrolysis processes
[COO-4455-2] N80-16723
Biological treatment of high strength petrochemical wastewater
[PB80-100456] N80-16959
ANALOG CIRCUITS
Analog double integration of shock pulses
N80-16231
ANALOG SIMULATION
Simulation studies of multiple large wind turbine generators on a utility network N80-16480
ANALYSIS (MATHEMATICS)
An extension of Strassen's law and some probabilistic results in complex analysis — brownian movements N80-16795
ANALYSIS OF VARIANCE
Confidence intervals for the common variance of equicorrelated normal random variables
[AD-A074339] N80-16800
Asymptotic normality of a variance estimator of a linear combination of a function of order statistics
[AD-A074848] N80-16805
On the uniformly minimum variance unbiased estimators of the variance and its reciprocal of an inverse Gaussian distribution
[AD-A074090] N80-16819
ANALYZING
Carl Zeiss Jena production of optical precision instruments described N80-17016
ANDES MOUNTAINS (SOUTH AMERICA)
Geology of the Acarigua area, Venezuela
N80-16630
ANEMOMETERS
Verification procedures for the SEASAT measurements of the vector wind with the SASS
[NASA-CR-162469] N80-16407
ANGLE OF ATTACK
Summary of theoretical and experimental investigations of vortex lift at high angles of attack
[AD-A074483] N80-16037
ANGULAR VELOCITY
Design of turbine blades for effective slip damping at high rotational speeds N80-16219
ANHYDRIDES
Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides — flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116
ANISOTROPIC PLATES
A penalty plate-bending element for the analysis of laminated anisotropic composite plates
[AD-A074236] N80-16375
ANISOTROPY
ALLS, a generalized crystallographic least squares program
[IS-4706] N80-16918
ANNIHILATION REACTIONS
The annihilation model of the Tormac sheath
N80-16879
ANNUAL VARIATIONS
The weather in 1978 N80-16679
Observations of temperature, current, and wind variations off the central eastern coast of Florida during 1970 and 1971
[PB-301280/4] N80-16709
The distribution and seasonality of the benthic aquatic macrophytes of the Pamlico River estuary, North Carolina
[PB-300496/7] N80-16710
ANNULAR FLOW
Prediction of laminar and turbulent flow heat transfer in annular passages
[PB-299867/2] N80-16311
ANTARCTIC REGIONS
Poleward heat flux and conversion of available potential energy in Drake passage
[PB-301311/7] N80-16712
ANTENNA ARRAYS
Dipole broadside glide slope array — for landing systems
[AD-A077042] N80-16047
ANTENNA COMPONENTS
Faraday rotation measurement method and apparatus — to receive RF signals from spacecraft which exhibits polarization characteristics due to spin stabilization
[NASA-CASE-NPO-14839-1] N80-16313

ANTENNA FEEDS
Antenna feed system for receiving circular polarization and transmitting linear polarization
[NASA-CASE-NPO-14362-1] N80-16261

ANTIMISSILE DEFENSE
A variable metric algorithm for the solution of the singular three-dimensional missile avoidance
[TAE-353] N80-16765

ANTIMONY
Comparative low energy electron diffraction studies of InSb(110) and GaAs(110) surfaces N80-16911

ANTIPROTONS
New directions in elementary particle physics: P anti p from very low to very high energies --- review of particle theory which includes particle collisions, particle energies, and elementary particle interactions
[BNL-26515] N80-16855

ANTIRADAR COATINGS
Radar absorber measurement techniques at frequencies above 20 GHz
[PB-299576/9] N80-16271

APPALACHIAN MOUNTAINS (NORTH AMERICA)
Application of plate tectonics to the location of new mineral targets in the Appalachians
[PB-300512/1] N80-16442

APPROACH
Optimum intensity setting of approach and runway light systems
[AD-A075485] N80-16046
Evaluation of the potential for reduced longitudinal spacing on final approach
[AD-A076434] N80-16049

APPROACH AND LANDING TESTS (STS)
Orbiter landing loads math model description and correlation with ALT flight data
[NASA-RP-1058] N80-16091

APPROACH CONTROL
USSR Report: Space, no. 1
[JPRS-74805] N80-16075
Space vehicle approach procedures described N80-16077

APPROXIMATION
Approximate confidence intervals for an exponential parameter from a sequential life test
[AD-A073897] N80-16360
Some approximations in vibrations and wave motion of elastic media N80-16364
Approximation methods for the partition functions of anharmonic systems
[COO-3127-30-T1] N80-16857

AQUEOUS SOLUTIONS
Characteristics of very concentrated aqueous solutions
[LBL-9660] N80-16120
Aqueous ammonia equilibrium - tabulation of percent un-ionized ammonia
[PB80-103518] N80-16132
Method for separating biological cells --- suspended in aqueous polymer systems
[NASA-CASE-MFS-23983-1] N80-16715

AQUICULTURE
The distribution and seasonality of the benthic aquatic macrophytes of the Pamlico River estuary, North Carolina
[PB-300496/7] N80-16710

AQUIFERS
Optimization techniques and numerical methods for aquifer management N80-16389
Aquifer modeling by numerical methods applied to an Arizona groundwater basin
[PB-298962/2] N80-16439

ARCHITECTURE (COMPUTERS)
Performance prediction of computer architectures operating on linear mathematical models
[UCRL-52582] N80-16746
Data flow computing: Software development
[UCRL-83026] N80-16783

ARGON
Mass spectrometer determination of argon contents in laser fusion target pellets
[UCRL-81416-REV-1] N80-16331

ARIZONA
Investigation of the application of HCMM thermal data to snow hydrology --- Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397
Geologic application of thermal-inertia mapping from satellite --- Powder River Basin, Wyoming and Cabeza Prieta, Arizona
[E80-10050] N80-16398

ASIA
Homogeneous magnitude system of the Eurasian continent: P waves
[PB-301282/0] N80-16666

ASSEMBLING
Assembly of interference fits by impact and constant force methods
[PB-301289/5] N80-16351
Information approach to parts mating --- for use on assembly systems for industrial engineering and product engineering
[PB-300519/6] N80-16352

ASTEROIDS
Long term variation of asteroid nutation N80-16981

ASTRONOMICAL COORDINATES
Determination of astronomic positions for California-Nevada boundary monuments near Lake Tahoe
[PB-301264/8] N80-16664

ASTRONOMICAL PHOTOMETRY
EUV observations of the local ism N80-16982

ASTRONOMY
Determination of astronomic positions for California-Nevada boundary monuments near Lake Tahoe
[PB-301264/8] N80-16664
A directory of computer software applications: Astronomy and astrophysics
[PB-294832/1] N80-16990

ASTROPHYSICS
A directory of computer software applications: Astronomy and astrophysics
[PB-294832/1] N80-16990

ASYMPTOTIC SERIES
Asymptotic normality of a variance estimator of a linear combination of a function of order statistics
[AD-A074846] N80-16805

ATLANTIC OCEAN
South Atlantic outer continental shelf geological studies, FY 1976
[PB-300822/4] N80-16701
South Atlantic outer continental shelf geological studies, FY 1976 --- sediment transport over the south Atlantic ocean bottom
[PB-300820/8] N80-16702

ATMOSPHERIC ATTENUATION
Evaluation of the attenuation of broad-band sound by a non-uniform still atmosphere
[ESDU-78003-A] N80-16836

ATMOSPHERIC CHEMISTRY
Atmospheric reaction products of organic compounds
[PB-301384/4] N80-16610

ATMOSPHERIC CIRCULATION
Stability of a turbulent layer cloud within the planetary boundary layer N80-16641
Numerical simulation of the formation and dissipation of stratus cloud under an inversion N80-16673
Thunderstorm-environment interactions determined with three-dimensional trajectories
[NASA-RP-1054] N80-16675

ATMOSPHERIC COMPOSITION
A catalog of perturbing influences on stratospheric ozone, 1955-1975
[AD-A063650] N80-16646

ATMOSPHERIC MODELS
Prospects for monthly forecasts with 3-D global weather models
[UCRL-82548] N80-16694

ATMOSPHERIC PHYSICS
AVE-SESAME 1: 25-MB sounding data
[NASA-TM-78256] N80-16683

ATMOSPHERIC PRESSURE
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16677
The mechanism of temperature and pressure changes in the Earth's atmosphere during solar flares
[NASA-TM-75349] N80-17007

ATMOSPHERIC TEMPERATURE
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10046] N80-16396
The influence of variations in ozone concentration on the temperature regime of the atmosphere
[NASA-TM-75350] N80-16649
The mechanism of temperature and pressure changes in the Earth's atmosphere during solar flares
[NASA-TM-75349] N80-17007

ATOMIC EXCITATIONS
Studies of atoms and molecules using multiphoton absorption of ultraviolet laser radiation N80-16844
Calculation of local fields in cubic lattices of polarizable atoms N80-16907

ATOMIC STRUCTURE
Selected topics on the electronic structure of small molecules N80-16843
The simple atomic hopping problem. Particle correlation functions with application to dipolar induced spin lattice relaxation N80-16850

ATOMIC THEORY
The simple atomic hopping problem. Particle correlation functions with application to dipolar induced spin lattice relaxation N80-16850

ATTITUDE (INCLINATION)
Lateral and tilt whirl modes of flexibly mounted flywheel systems N80-16215
Mirror position display equipment for the target chamber mirror mounts of the LASL Helios laser fusion facility
[LA-UR-79-569] N80-16894

AUGER SPECTROSCOPY
Low energy electron diffraction and auger electron spectroscopy studies of the structure and chemistry of iron single crystal surfaces N80-16902

AURORAL ELECTROJETS
Auroral electrojet magnetic activity indices AE (11-12) for January - June 1975
[PB80-106974] N80-16657

AURORAS
On the generation of auroral kilometric radiation N80-16644

AUSTENITIC STAINLESS STEELS
Elastic and plastic strains and the stress corrosion cracking of austenitic stainless steels
[COO-2576-9] N80-16144
Localized corrosion and stress corrosion cracking behavior of austenitic stainless steel weldments containing retained ferrite
[COO-2462-5] N80-16149
Method of assessing the impact of metallurgical noise and its reduction in ultrasonic testing of austenitic welds
[GEFR-SP-164] N80-16349

AUSTRALIA
Ionospheric storm effects on maximum usable frequencies on circuits around Australia
[IPS-R-35] N80-16647

AUTOMATED GUIDEWAY TRANSIT VEHICLES
Vehicle longitudinal control and reliability project. A review of AGT propulsion, power conditioning, braking and power distribution technology, volume 2, part C
[PB-300373/8] N80-16954
Vehicle longitudinal control and reliability project. A review of entrainment technology
[PB-300372/0] N80-16955
AGT guideway and station technology. Volume 8: Weather protection concepts
[PB-299746/8] N80-16974

AUTOMATIC CONTROL
Stochastic filtering and control
[AD-A074258] N80-16820
Mirror position display equipment for the target chamber mirror mounts of the LASL Helios laser fusion facility
[LA-UR-79-569] N80-16894

AUTOMATION
Carl Zeiss Jena production of optical precision instruments described N80-17016

AUTOMOBILE ENGINES
Engine combustion technology overview
[SAND-78-8801] N80-16347

AXES OF ROTATION
Nonorthogonal measurement axes in laser Doppler velocimetry
[AD-A073700] N80-16323

AXIAL LOADS
Dynamic yielding of polycrystalline materials under biaxial loading N80-16366
Acoustic emission generated in unflawed 7075-T651 aluminum under uniform biaxial loading
[UCRL-81030] N80-16382
AXIAL STRAIN
Biaxial creep-fatigue behavior of type 316h stainless steel tube
[ANL-79-33] N80-16146
AZINES
Perfluroether triazine elastomers
[NASA-CR-162748] N80-16166

B

B-1 AIRCRAFT
Status of cavity noise phenomena measurement and suppression on the B-1 aircraft N80-16202
Application of random time domain analysis to dynamic flight measurements --- B-1 aircraft
N80-16226
B-70 AIRCRAFT
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-701) 2: Extrapolation of wind-tunnel data to full-scale conditions
[NASA-TP-1515] N80-16032
BACKSCATTERING
Backscatter response of snow covered roads and roadside surfaces
[SAND-79-7046] N80-16413
BACTERIA
Analysis of airborne viable bacteria at solid waste processing facilities
[PB80-102338] N80-16590
Method and apparatus for eliminating luminol interference material
[NASA-CASE-MSC-16260-1] N80-16714
BALL BEARINGS
Analysis of wear-debris from full-scale bearing fatigue tests using the ferrograph
[NASA-TM-81403] N80-16341
M-50 steel bearing material factors for rolling element life calculations
[AD-A074217] N80-16345
BALLISTICS
Prediction of fragment velocities and trajectories
N80-16210
BALMER SERIES
High resolution spectroscopy of the hydrogen Balmer-alpha line N80-16848
BANDPASS FILTERS
Superconducting notch filter --- for application to the HF communication band
[CONF-790815-23] N80-16281
BAROTROPIC FLOW
Dynamics of equatorial mass-flow adjustment
N80-16671
BAYES THEOREM
Empirical Bayes estimation of critical dosages having smallest predictive risk
[AD-A074376] N80-16729
A Bayesian approach to the selection of variables in multiple regression N80-16815
BAYS (STRUCTURAL UNITS)
Status of cavity noise phenomena measurement and suppression on the B-1 aircraft N80-16202
BAYS (TOPOGRAPHIC FEATURES)
An assessment of the effects of bathymetric changes associated with sand and gravel mining on tidal circulation in the lower bay of New York Harbor
[PB80-106487] N80-16703
BEACON COLLISION AVOIDANCE SYSTEM
Air traffic control/full beacon collision avoidance system, Knoxville simulation
[AD-A074555] N80-16043
Modeling pilot response delays to beacon collision avoidance system commands
[AD-A075946] N80-16734
BEAM RIDER GUIDANCE
Dynamic analysis of beam-rider missile performance
[TAE-376] N80-16085
BEAM SPLITTERS
Conceptual development of the Laser Beam Manifold (LBM)
[NASA-TM-78248] N80-16322
BEAMS (SUPPORTS)
Seismic behavior of reinforced concrete interior beam-column subassemblages
[PB-301326/5] N80-16254
Investigation of the suitability of the Bazant endochronic material model for modelling the concrete in a SAMSON analysis of a reinforced concrete beam
[AD-A074202] N80-16377
BEDS (PROCESS ENGINEERING)
Mass transfer controlled reactions in packed beds at low Reynolds numbers N80-16112
Experimental and theoretical investigation of ethylene oxidation in a fixed-bed reactor
N80-16114
BELGIUM
The weather in 1978 N80-16679
Recent rain measurement maps of Belgium
N80-16680
BENDING FATIGUE
A penalty plate-bending element for the analysis of laminated anisotropic composite plates
[AD-A074236] N80-16375
BENDING MOMENTS
Wing flapping with minimum energy --- minimize the drag for a bending moment at the wing root
[NASA-TM-81174] N80-16035
Influences of the couple-stresses on the pure-bending of a circular cylinder
[GA-A-15141] N80-16385
BERING SEA
A numerical investigation of the Bering Sea circulation using a linear homogeneous model
[PB-299884/7] N80-16711
BIBLIOGRAPHIES
Aeronautical Engineering: A continuing bibliography, supplement 116
[NASA-SP-7037(116)] N80-16023
Collision avoidance systems. A bibliography with abstracts
[NTIS/PS-79/0960/9] N80-16053
Technological forecasting-aircraft design. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/1017/7] N80-16057
Manufacturing in space. Citations from the International Aerospace Abstracts data base --- bibliographies
[NTIS/PS-79/1053/2] N80-16074
Alcohol fuels. Citations from the American petroleum institute data base --- a bibliography with abstracts
[NTIS/PS-79/0911/2] N80-16195
Hot film anemometry. A bibliography with abstracts
[NTIS/PS-79/0909/6] N80-16318
Hot wire anemometry, volume 2. A bibliography with abstracts
[NTIS/PS-79/0957/5] N80-16319
Carbon dioxide lasers, volume 4. A bibliography with abstracts
[NTIS/PS-79/1068/0] N80-16333
Carbon dioxide lasers, volume 3: A bibliography with abstracts
[NTIS/PS-79/1067/2] N80-16334
Inert gas welding. Citations from the NTIS data base --- a bibliography with abstracts
[NTIS/PS-79/0995/5] N80-16353
Inert gas welding, volume 3: Citations from the Engineering Index data base --- a bibliography with abstracts
[NTIS/PS-79/0996/3] N80-16354
Energy: A continuing bibliography with indexes, issue 23
[NASA-SP-7043(23)] N80-16449
Solar energy concentrator design and operations. Citations from the NTIS data base
[NTIS/PS-79/0926/0] N80-16557
Solar energy concentrator design and operations. Citations from the Engineering Index data base
[NTIS/PS-79/0927/8] N80-16558
Energy Research Information System (ERIS) projects report, volume 4, number 1 --- bibliographies
[PB-300338/1] N80-16561
Energy policy and research planning, volume 3. A bibliography with abstracts

Flat plate solar collector design and performance. Citations from the NTIS data base
[NTIS/PS-79/0928/6] N80-16566
Flat plate solar collector design and performance. Citations from the Engineering Index data base
[NTIS/PS-79/0929/4] N80-16567
Heliostat system design and operation. Citations from the Engineering Index data base
[NTIS/PS-79/0930/2] N80-16571
Bibliography of geology and hydrology, eastern New Mexico
[PB-300832/3] N80-16663
Aerospace Medicine and Biology: A continuing bibliography with indexes supplement 201
[NASA-SP-7011(201)] N80-16724
Network flows, volume 2. A bibliography with abstracts
[NTIS/PS-79/1078/9] N80-16826
Network flows, volume 1. A bibliography with abstracts
[NTIS/PS-79/1077/1] N80-16827
Interactions of molecular and ion beams with surfaces --- bibliographies
[AD-A073278] N80-16853
Theoretical high energy physics --- bibliography
[COO-2271-102] N80-16865
A directory of computer software applications: Space technology
[PB-296039/1] N80-16956
Electric automobiles, volume 2. Citations from the Engineering Index data base
[NTIS/PS-79/0991/4] N80-16977
A directory of computer software applications: Astronomy and astrophysics
[PB-294832/1] N80-16990
Fiscal year 1979 scientific and technical reports, articles, papers and presentations
[NASA-TM-78250] N80-17014
BINARY CODES
A grouped binary time code for telemetry and space applications
[NASA-TM-80606] N80-16090
BINARY MIXTURES
Evolution of weak disturbances in inert binary mixtures
[NASA-TM-80925] N80-16296
Preliminary evaluation of commercial continuous instrumentation for the measurement of viscosity and coal concentration of Coal-Oil Mixtures (COM)
[HCP/T2463-03] N80-16315
BINARY STARS
X-ray observations of a compact binary source
[NASA-CR-162750] N80-16989
Studies of the local interstellar medium
[NASA-CR-162749] N80-16997
BIOASSAY
Method and apparatus for eliminating luminol interference material
[NASA-CASE-MSC-16260-1] N80-16714
Empirical Bayes estimation of critical dosages having smallest predictive risk
[AD-A074376] N80-16729
BIOSAY: A computer program to store and report bioassay data
[UCID-17989] N80-16773
BIOASTRONAUTICS
Thermodynamic considerations in the support of life for long space voyages
[NASA-CR-162755] N80-16738
BIODYNAMICS
Planar biped dynamics and control N80-16736
BIOENGINEERING
Development of percutaneous energy transmission systems
[PB-299739/3] N80-16731
Implanted energy conversion system
[PB80-101116] N80-16733
Physical testing of polymers for use in circulatory assist devices
[PB80-101546] N80-16740
BIOLOGICAL EFFECTS
Aerospace Medicine and Biology: A continuing bibliography with indexes supplement 201
[NASA-SP-7011(201)] N80-16724
Biological effects of high-voltage electric fields. Volume 1: An update
[EPRI-EA-1123] N80-16730
BIOMASS
A simulation model of estuarine subsystem coupling and carbon exchange with the sea N80-16699

The distribution and seasonality of the benthic aquatic macrophytes of the Pamlico River estuary, North Carolina
[PB-300496/7] N80-16710
Utilization of natural ecosystems for wastewater renovation
[PB80-100431] N80-16962

BIOMASS ENERGY PRODUCTION
Autohydrolysis for improving methane yield from fermentation of lignocellulose N80-16175
Assessment of the technical and economic feasibility of converting wood residues to liquid and gaseous fuel products using state-of-the-art and advanced coal conversion technology
[COO-4862-3] N80-16189
Decentralized energy: Technology assessment and systems description
[BNL-50987] N80-16502
Soil fertility and soil loss constraints on crop residue removal for energy production
[SERI/RR-52-324] N80-16511

BIOMETRICS
Qualitative study of nonlinear problems in analysis
[AD-A074017] N80-16807

BIONICS
Planar biped dynamics and control N80-16736

BIOPHYSICS
Physio-chemical investigation of some areas of fundamental significance to biophysics
[ORO-3018-T1] N80-16721

BIOSPHERE
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Yellowstone National Park
[PB-301333/1] N80-16429
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Rocky Mountain National Park
[PB-301334/9] N80-16430

BIOTECHNOLOGY
Development of precutaneous energy transmission
[PB-300518/8] N80-16732
Physical testing of polymers for use in circulatory assist devices
[PB80-101546] N80-16740

BISMUTH
Ginzburg-Landau theory and the superconducting transition in thin, amorphous bismuth films N80-16912

BITUMENS
Evaluation of the effectiveness of fabric reinforcement in extending the in-service life of bituminous concrete overlays
[PB-301305/9] N80-16248
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932

BLACK HOLES (ASTRONOMY)
Interior Reissner-Nordstrom black holes N80-16978

BLADE TIPS
Experimental evaluation of active and passive means of alleviating rotor impulsive noise in descent flight
[NASA-CR-159188] N80-16839

BLOOD COAGULATION
The significance of ACTH for the process of formation of complex heparin compounds in the blood during immobilization stress
[NASA-TM-75946] N80-16727

BLOOD PUMPS
Development of precutaneous energy transmission
[PB-300518/8] N80-16732

BLOOD VESSELS
Effect of gravitation stress and hypokinesia on blood vessels of the testicle
[NASA-TM-75942] N80-16726

BODIES OF REVOLUTION
Electromagnetic scattering by two bodies of revolution N80-16277
An experimental investigation of the effect of drag reducing polymer additives on surface pressure fluctations on bodies of revolution with rough surfaces moving through water
[AD-A073836] N80-16302

BODY TEMPERATURE
Effects of ingestion of cold and hot water on the course of thermal changes in the stomach and intestine
[NASA-TM-75515] N80-16728

BODY-WING CONFIGURATIONS
Development of panel methods for subsonic analysis and design
[NASA-CR-3234] N80-16033

BOEING 747 AIRCRAFT
Expanded study of feasibility of measuring in-flight 747/JT9D loads, performance, clearance, and thermal data
[NASA-CR-159717] N80-16063

BONDING
Increased fracture toughness of graphite-epoxy composites through intermittent interlaminar bonding --- Mylar interlayer
[NASA-CR-159198] N80-16106
Mechanisms of lubrication and wear of a bonded solid lubricant film
[NASA-TM-81396] N80-16165

BOOLEAN ALGEBRA
Transformational structure of algebraic logics N80-16793
Using SETS to find minimal cut sets in large fault trees
[SAND-78-1943C] N80-16809

BOOMS (EQUIPMENT)
Design, fabrication and testing of the air-jet oil boom
[PB80-102635] N80-16593

BORON
Energy spectra of cosmic ray nuclei to above 100 GeV/nucleon --- measurement of energy spectra of cosmic ray nuclei boron to iron
[NASA-TM-80587] N80-17011

BORON CARBIDES
Sintering kinetics of pure and doped boron carbide
[UCRL-82515] N80-16108
Preparation of fiber reinforced titanium diboride and boron carbide composite bodies
[LA-UR-79-969] N80-16109

BOUNDARY LAYER FLOW
Effect of streamwise vortices on Tollmien-Schlichting waves
[NASA-CR-162654] N80-16294

BOUNDARY LAYER SEPARATION
The motion of a vortex pair in a stratified medium N80-16026

BOUNDARY LAYER STABILITY
Nonparallel stability of three-dimensional compressible boundary layers. Part 1: Stability analysis
[NASA-CR-3245] N80-16296

BOUNDARY LAYER TRANSITION
Predicting transition to turbulence in the compressible boundary layer flow over a spinning cone N80-16025
Transitional flow in an annulus N80-16289

BOUNDARY VALUE PROBLEMS
Boundary conditions for flow computation with nonorthogonal curvilinear coordinates
[KAPL-4123] N80-16304
Stress singularities at the corners of a semi-infinite strip N80-16370
Fast algorithms for NP-hard problems which are optimal or near-optimal with probability one N80-16756
Analysis and testing of numerical formulas for the initial value problem
[NASA-CR-162655] N80-16799
Generalized Adams methods --- for underwater acoustic wave propagation problem
[AD-A074548] N80-16801
The 1979 SIGNUM meeting on Numerical Ordinary Differential equations
[COO-2383-0058] N80-16810

BRAIN
Glucose metabolism in different regions of the rat brain under hypokinetic stress influence
[NASA-TM-75949] N80-16718

BRAKES (FOR ARRESTING MOTION)
Long life hydraulic brake system, summary
[PB80-104730] N80-16350
Vehicle longitudinal control and reliability project. A review of AGT propulsion, power conditioning, braking and power distribution technology, volume 2, part C
[PB-300373/8] N80-16954

BRAYTON CYCLE
Potential performance improvement using a reacting gas (nitrogin tetroxide) as the working fluid in a closed Brayton cycle
[NASA-TM-79322] N80-16490

BRINES
Apparatus and techniques for the study of precipitation of solids and silica from hypersaline geothermal brine
[UCRL-52799] N80-16127

BROADBAND
The design of efficient, broadband ultrasonic transducers N80-16833
The occurence rate, polarization character and intensity of broadband Jovian kilometric radiation --- Voyager Project
[NASA-TM-80627] N80-17002

BROADCASTING
On the effect of redundancy on the multiple access broadcast channel
[AD-A073579] N80-16265

BROWNIAN MOVEMENTS
An extension of Strassen's law and some probabilistic results in complex analysis --- brownian movements N80-16795

BUCKLING
Design equation for tripping of stiffeners under in plane and lateral loads
[AD-A074752] N80-16379

BUILDINGS
A study of indirect fire losses from fires in non-residential properties. Volume 1: Research report
[PB-299126/3] N80-16241
A study of indirect fire losses from fires in non-residential properties. Volume 3: Indirect residential fire loss - a case study
[PB-299127/1] N80-16242
Probabilistic analysis of temperature loads for structures, structural loads analysis and specifications project
[PB-301415/6] N80-16251
Investigation of the nonlinear characteristics of a three story steel frame using system
[PB-301363/8] N80-16253
Seismic behavior of reinforced concrete interior beam-column subassemblages
[PB-301326/5] N80-16254
Simplified procedure for calculating the effects of daylight from clear skies
[LBL-9048] N80-16695

BUTENES
Development of dry process microporous polysulfone supports for ultrathin film composites
[PB-300488/4] N80-16133

C

CALCULATORS
Prediction of fiber composite mechanical behavior made simple --- using a rocket calculator
[NASA-TM-81404] N80-16107

CALIBRATING
Heliostat beam characterization system-calibration technique --- the design analysis and calibration techniques of heliostats using video equipment
[SAND-79-1532C] N80-16531

CALIFORNIA
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10046] N80-16396
Investigation of the application of HCMM thermal data to snow hydrology --- Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397
L-band radar sensing of soil moisture --- Kern County, California
[NASA-TM-80628] N80-16404
Petroleum production at maximum efficient rate, Naval Petroleum Reserve no. 1 (Elk Hills), Kern County, California
[DOE/EIS-0012] N80-16581
Nitrate in effluents from irrigated lands --- Santa Maria Valley
[PB-300582/4] N80-16587
Environmental system study on the development of fossil fuel resources in the Southwest
[PB-300526/1] N80-16596

Detailed characterization of gaseous and size resolved particulate pollutants at a south coast air basin smog receptor site: levels and modes of formation of sulfate, nitrate and organic particulates and their implications for control strategies
[PB-301294/5] N80-16611

Geophysics of the Gaysers geothermal field northern California N80-16639

Determination of astronomic positions for California-Nevada boundary monuments near Lake Tahoe
[PB-301264/8] N80-16664

ARMA models for earthquake ground motions
[PB-301166/5] N80-16667

Low-level radioactive waste management. Volume 5: Policy recommendations, conclusions and summary
[PB80-105083] N80-16872

Human service agency transportation coordination
[PB-300891/9] N80-16965

CAMERAS
Time-lapse sky photography using low cost camera systems
[PB-300406/6] N80-16669

CAMS
Design of disc cams with translating roller followers: Calculation methods
[ESDU-79007] N80-16335

CANADA
Design characteristics of the 224 kW Magdalen Islands VAWT N80-16463

CANALS
Saltwater-barrier line in Florida: Concepts, considerations, and site examples
[PB80-101306] N80-16591

CANONICAL FORMS
Constructive extension and implementation of abstract data types and algorithms N80-16759

CARBOHYDRATE METABOLISM
Glucose metabolism in different regions of the rat brain under hypokinetic stress influence
[NASA-TM-75949] N80-16718

CARBON
Electrochemistry of acetylides, nitrides and carbon cathodes in molten halides
[COO-4445-T1] N80-16121

Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 2: The effect of non-Maxwellian electron distribution functions on ionization equilibrium calculations for carbon, nitrogen and oxygen
[NASA-CR-162695] N80-16852

Activated carbon treatment of industrial wastewaters: Selected technical papers
[PB80-100522] N80-16963

CARBON DIOXIDE LASERS
Infrared runway collision avoidance system analysis — carbon dioxide lasers
[AD-A078131] N80-16069

High resolution saturation spectroscopy with CO2 lasers. Application to the nu sub 3 bands of SF6 and OsO4
[LA-UR-79-1913] N80-16123

High-energy, short-pulse, carbon-dioxide lasers
[LA-UR-79-1203] N80-16326

Antares laser power amplifier — using a carbon dioxide laser
[LA-UR-79-1525] N80-16328

Antares power amplifier optical system
[LA-UR-79-2270] N80-16332

Carbon dioxide lasers, volume 4. A bibliography with abstracts
[NTIS/PS-79/1068/0] N80-16333

Carbon dioxide lasers, volume 3: A bibliography with abstracts
[NTIS/PS-79/1067/2] N80-16334

Energy dispersion and relaxation in propynal using laser IR/visible double resonance
[COO-4695-2] N80-16381

CO2-laser induced hot electron magneto-transport effects in n-InSb N80-16905

CARBON FIBER REINFORCED PLASTICS
Composite components under impact load and effects of defects on the loading capacity — Alpha Jet tail assembly
[NASA-TM-75351] N80-16104

CARBON FIBERS
Preparation of fiber reinforced titanium diboride and boron carbide composite bodies
[LA-UR-79-969] N80-16109

Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074656] N80-16278

Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074655] N80-16279

CARTESIAN COORDINATES
Nonorthogonal measurement axes in laser Doppler velocimetry
[AD-A073700] N80-16323

CASCADE RANGE (CA-OR-WA)
Petrology and stratigraphy of paleogene nonmarine sandstones, Cascade Range, Washington N80-16638

CASES (CONTAINERS)
Manufacturing methods of a composite cell case for a Ni-Cd battery
[NASA-CR-162724] N80-16488

CATALYSTS
The development and utilization of inelastic electron tunneling spectroscopy as a tool for investigating fundamental catalytic processes N80-16113

Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides — flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116

CATECHOLAMINE
Catecholamines and myocardial contractile function during hypodynamia and with an altered thyroid hormone balance
[NASA-TM-76000] N80-16720

CELL CATHODES
Energy savings through use of an improved reduction cell cathode
[SAN-1257-T2] N80-16515

CELLS (BIOLOGY)
Method for separating biological cells — suspended in aqueous polymer systems
[NASA-CASE-MFS-23883-1] N80-16715

CELLULOSE
Autohydrolysis for improving methane yield from fermentation of lignocellulose N80-16175

CENSORED DATA (MATHEMATICS)
Influence functions for censored data N80-16794

CENTRAL EUROPE
East Europe report: Scientific affairs, no. 659
[JPRS-74911] N80-17015

CENTRIFUGES
Active optimal control for suppression of whirl of a flexible centrifuge N80-16336

CERAMICS
Energy savings through use of an improved reduction cell cathode
[SAN-1257-T2] N80-16515

CH-47 HELICOPTER
Digital adaptive controllers for VTOL vehicles. Volume 1: Concept evaluation
[NASA-CR-159154-VOL-1] N80-16065

CHANNEL FLOW
Natural convection in a vertical channel with heat and mass transfer and flow reversal N80-16291

Flow routing in the Susquehanna River Basin. Part 3: Routing reservoir releases in the Tioga and Chemung Rivers System, Pennsylvania and New York
[PB-301393/5] N80-16415

Eddyless channel flows and their stability
[PB80-104649] N80-16427

CHARGE CARRIERS
The interface state effects and characterization of MIS solar cells — describing the charge carrier mechanisms and electron tunneling behavior N80-16451

CHARGE EXCHANGE
Coherence effects in heavy ion-atom collisions
[CONF-780936-1] N80-16860

CHARGE TRANSFER
Theoretical studies of excess electron mobilities and change-transfer spectra N80-16841

CHECKOUT
On-line programmer's management system. Addendum 2: Programmer's guide to the debugger
[AD-A074496] N80-16776

CHEMICAL ATTACK
Erosion-corrosion
[BNL-24864] N80-16154

CHEMICAL CLEANING
Evaluation of methods for cleaning low carbon uranium metal and alloy samples
[RFP-2793] N80-16155

Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 2
[PB-299384/8] N80-16193

CHEMICAL CLOUDS
Remote sensing for diagnosing vapor dispersion in spills of liquid energy fuels
[UCID-18237] N80-16408

CHEMICAL COMPOUNDS
Formal description, coding and computer handling of generic formulae in chemical patents — parsing algorithms
[BLL-BLRDR-5490] N80-16944

CHEMICAL ENGINEERING
Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 1
[PB-299383/0] N80-16192

Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 2
[PB-299384/8] N80-16193

CHEMICAL EQUILIBRIUM
Aqueous ammonia equilibrium - tabulation of percent un-ionized ammonia
[PB80-103518] N80-16132

CHEMICAL REACTIONS
Alcohol fuels. Citations from the American petroleum institute data base — a bibliography with abstracts
[NTIS/PS-79/0911/2] N80-16195

CHEMICAL REACTORS
Flash hydropyrolysis of coal
[BNL-51010] N80-16185

CHEMILUMINESCENCE
Method and apparatus for eliminating luminol interference material
[NASA-CASE-MSC-16260-1] N80-16714

CHIPS (ELECTRONICS)
Devices for manufacture of microstructures, chips described N80-17017

CHLORINE
Survey of potential chlorine production processes — for energy efficiency
[ANL/OEPM-79-1] N80-16131

CHLOROCARBONS
Transport properties of chlorosulfonated block copolymers — to study the sorption and diffusion of water at various humidities N80-16160

CHLOROPRENE RESINS
Effectiveness of neoprene seals in preventing concrete pavement contraction joint deterioration
[PB-300594/9] N80-16244

CHONDRITES
Noble-gas-rich separates from ordinary chondrites N80-17000

CHROMOSPHERE
Studies of the local interstellar medium
[NASA-CR-162749] N80-16997

CHRONOLOGY
Thermoluminescence dating apparatus efficiency measurement using a standard light source
[BNL-24525] N80-16314

CHRONOPHOTOGRAPHY
Time-lapse sky photography using low cost camera systems
[PB-300406/6] N80-16669

CIRCUIT DIAGRAMS
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 1: Principles of operation
[AD-A074542] N80-16044

The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 2: Appendices to the principles of operation
[AD-A074482] N80-16045

CIRCUIT PROTECTION
FAA lightning protection study: Report of investigations relative to providing lightning protection for the Remote Center Air-to-Ground (RCAG)
[AD-A076943] N80-16259

Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074655] N80-16279

CIRCULAR CYLINDERS
Influences of the couple-stresses on the pure-bending of a circular cylinder
[GA-A-15141] N80-16385
CITIES
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438
Hydrologic data from urban watersheds in the Tampa Bay region
[PB-301204/4] N80-16447
Human service agency transportation coordination
[PB-300891/9] N80-16965
CLASSICAL MECHANICS
Interaction between classical and quantum systems: A new approach to quantum measurement. 2: Theoretical considerations
[ORO-3992-342] N80-16930
Interaction between classical and quantum systems: A new approach to quantum measurement. 3: Illustration
[ORO-3992-343] N80-16931
CLASSIFICATIONS
Evaluation of registration, compression, and classification algorithms. Volume 2: Documentation
[E80-10042] N80-16392
Toward classification and rationale for watershed management and stream protection
[PB80-103153] N80-16417
CLEAN FUELS
Fossil energy program
[ORNL-5487] N80-16506
CLEANERS
Evaluation of methods for cleaning low carbon uranium metal and alloy samples
[RFP-2793] N80-16155
CLIMATOLOGY
Thunderstorm-environment interactions determined with three-dimensional trajectories
[NASA-RP-1054] N80-16675
The role of satellite altimetry in climate studies
[NASA-TP-1570] N80-16676
The weather in 1978 N80-16679
CLINICAL MEDICINE
Development of percutaneous energy transmission systems
[PB-299739/3] N80-16731
A stochastic approach to ultrasonic tissue characterization N80-16834
CLOCKS
Satellite time transfer via Tracking and Data Relay Satellite System (TDRSS) and applications
[NASA-TM-80605] N80-16064
CLOSED ECOLOGICAL SYSTEMS
Thermodynamic considerations in the support of life for long space voyages
[NASA-CR-162755] N80-16738
CLOUD PHYSICS
The structure and microphysical properties of the clouds of Venus
[NASA-TM-75725] N80-17006
CLOUD SEEDING
Project skywater. Skywater conference 10, June 1978: The Sierra cooperative pilot project design
[PB-298529/9] N80-16696
CLOUDS
The internal refractive index spectra of clouds from forward scatter radar observations
[PB80-107238] N80-16660
CMOS
Radiation-hardened bulk CMOS technology
[SAND-79-0714C] N80-16919
COAL
Theoretical modeling of coal and gas fired turbulent combustion and gasification processes N80-16176
Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 1
[PB-299383/0] N80-16192
Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 2
[PB-299384/8] N80-16193
Preliminary evaluation of commercial continuous instrumentation for the measurement of viscosity and coal concentration of Coal-Oil Mixtures (COM)
[HCP/T2463-03] N80-16315
Strip coal mining and mined-land reclamation in the hydrologic system, southeastern Montana
[PB-301253/1] N80-16441
Improved light scattering dust monitor
[PB-299938/1] N80-16445
Remote sensing of sulfur dioxide effects on vegetation - photometric analysis of aerial photographs
[PB-300460/3] N80-16600
Evaluation of the environmental effects of western surface coal mining. Volume 2: Mine inventory
[PB-301249/9] N80-16621
Environmental assessment of surface mining methods: Head-of-hollow fill and mountaintop removal
[PB-300540/2] N80-16622
Mathematical modeling and experimental studies of thermal reactions of coal — mathematical model of coal pyrolysis N80-16925
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932
COAL GASIFICATION
Heavy hydrocarbons from coal gasification vapor pressures and dew point N80-16111
Coal gasification
[DOE/ET-0067/3] N80-16184
Flash hydropyrolysis of coal
[BNL-51010] N80-16185
Assessment of the technical and economic feasibility of converting wood residues to liquid and gaseous fuel products using state-of-the-art and advanced coal conversion technology
[COO-4862-3] N80-16189
Development studies on selected conversion of synthesis gas from coal to high octane gasoline
[FE-2276-27] N80-16190
Environmental development plan: Underground coal gasification
[DOE/EDP-0047] N80-16411
Molecular thermodynamics of dew-point calculations in coal gasification processes N80-16926
COAL LIQUEFACTION
Stability studies of coal liquids
[PETC/TR-79/5] N80-16129
Conceptual design of a coal-to-methanol-to-gasoline commercial plant: Executive summary
[FE-2416-43] N80-16182
Coal liquefaction
[DOE/ET-0068/3] N80-16183
COAL UTILIZATION
Comparative assessment of residential energy supply systems that use fuel cells: Executive summary — domestic energy supply systems analysis of coal fired power plants using fuel cells
[PB-299207/1] N80-16564
Status of pollutant removal technology for coal fired plants in the northeastern U.S.
[BNL-51004] N80-16580
COASTAL CURRENTS
Observations of temperature, current, and wind variations off the central eastern coast of Florida during 1970 and 1971
[PB-301280/4] N80-16709
COASTAL PLAINS
Environmental impact and economic evaluation research needs for coastal and marine resource management
[PB-301206/5] N80-16604
The Yallahs fan delta, southeastern Jamaica: A depositional model for active tectonic coastlines N80-16632
COASTAL WATER
Long-range electronic navigation systems in the Hawaiian Archipelago
[PB-300842/2] N80-16052
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16706
Coastal upwelling ecosystems analysis. Nitrate reductase activity in the North West African upwelling area
[PB-301030/3] N80-16707
COASTS
NCSL remote sensing project — State Legislature considerations and activities
[E80-10053] N80-16401
Coastal upwelling ecosystems analysis. Interactions of primary nutrient and carbon uptake in the Peru current: A review and synthesis of laboratory and field results
[PB-301031/1] N80-16708
COAXIAL PLASMA ACCELERATORS
Plasma physics and problems of controlled thermonuclear reactions
[UCRL-TRANS-11487] N80-16888
COBALT COMPOUNDS
Magnetic properties of selected transition metal compounds N80-16136
COBALT ISOTOPES
Mossbauer measurements on low temperature deuteron implanted Al(Co57) N80-16906
COBOL
International Business Machines Corporation system 34
[PB-299650/2] N80-16747
Datapoint 6600 COBOL 2.3
[PB-299651/0] N80-16748
Honeywell information systems COBOLA 0100
[PB-299652/8] N80-16749
Digital Equipment Corporation, PDP 11/70, PDP 11 COBOL, version 4.0
[PB-299653/6] N80-16750
NCR Corporation, IMOS COBOL: Indexed I-O based X3.23-1974
[PB80-101868] N80-16752
CODING
Spectral peak amplitude coding for voice data compression — the coding of speech spectral bands for voice data processing N80-16258
Computer science and technology: A key notarization system for computer networks
[PB80-104898] N80-16787
Formal description, coding and computer handling of generic formulae in chemical patents — parsing algorithms
[BLL-BLRDR-5490] N80-16944
COHERENT SCATTERING
Coherence effects in heavy ion-atom collisions
[CONF-780936-1] N80-16860
COKE
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932
COLD WORKING
Elastic and plastic strains and the stress corrosion cracking of austenitic stainless steels
[COO-2576-9] N80-16144
COLLAGENS
Development of percutaneous energy transmission systems
[PB-299739/3] N80-16731
COLLISION AVOIDANCE
Report of the FAA task force on aircraft separation assurance. Volume 1: Executive summary
[AD-A075352] N80-16050
Collision avoidance systems. A bibliography with abstracts
[NTIS/PS-79/0960/9] N80-16053
Infrared runway collision avoidance system analysis — carbon dioxide lasers
[AD-A078131] N80-16069
A variable metric algorithm for the solution of the singular three-dimensional missile avoidance
[TAE-353] N80-16785
COLLISION PARAMETERS
Central collisions in intermediate energy heavy-ion reaction
[CONF-790743-5] N80-16854
COLORADO
Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types — San Juan Mountains, Colorado
[E80-10041] N80-16391
Computer-aided processing of LANDSAT MSS data for classification of forestlands — San Juan Mountains, Colorado
[E80-10043] N80-16393
Treatment of secondary effluent by infiltration-percolation — Boulder, Colorado
[PB80-103658] N80-16973
COLUMNS (SUPPORTS)
Seismic behavior of reinforced concrete interior beam-column subassemblages
[PB-301326/5] N80-16254
COMBUSTIBLE FLOW
Scaling of some flowfields with flames — internal combustion engines
[CONF-7811102-2] N80-16305

COMBUSTION
Theoretical modeling of coal and gas fired turbulent combustion and gasification processes N80-16176

COMBUSTION CHAMBERS
Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159598] N80-16061
Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159749] N80-16062
A numerical model of high intensity confined hydrocarbon flames
[TAE-322] N80-16119
Theoretical modeling of coal and gas fired turbulent combustion and gasification processes N80-16176

COMBUSTION EFFICIENCY
Infrared measurements of a scramjet exhaust — to determine combustion efficiency
[NASA-CR-3242] N80-16058
Combustion of multicomponent fuel droplets
[COO-4449-2] N80-16126

COMBUSTION PHYSICS
Combustion optimization studies for stratified charge and diesel engines
[COO-4191-2] N80-16346

COMMUNICATION
Designing information: Some approaches, some problems and some suggestions — conference
[BLL-BLRDR-5509] N80-16938

COMMUNICATION SATELLITES
The initial growth and expanding opportunities of US domestic satellite service
[PB-300438/9] N80-16272

COMPACTING
Chemical compaction aids for fine-grained soils, volume 1
[PB-301115/2] N80-16654

COMPILERS
International Business Machines Corporation system 34
[PB-299650/2] N80-16747
Datapoint 6600 COBOL 2.3
[PB-299651/0] N80-16748
Honeywell information systems COBOLA 0100
[PB-299652/8] N80-16749
Digital Equipment Corporation, PDP 11/70, PDP 11 COBOL, version 4.0
[PB-299653/6] N80-16750

COMPLEMENTS (MATHEMATICS)
Some N by DN linear complementarity problems solvable by a principal pivoting algorithm with applications
[AD-A073929] N80-16772
On Q-matrices, centroids and simplotopes
[AD-A074959] N80-16803

COMPOSITE MATERIALS
Composite materials research and education program: The NASA-Virginia Tech composites program
[NASA-CR-162719] N80-16101
Effect of temperature on composite sandwich structures subjected to low velocity impact — aircraft construction materials
[NASA-CR-162718] N80-16103
Preparation of fiber reinforced titanium diboride and boron carbide composite bodies
[LA-UR-79-969] N80-16109
Development of dry process microporous polysulfone supports for ultrathin film composites
[PB-300486/4] N80-16133
Crystalline polyimides — reinforcing fibers for high temperature composites and adhesives as well as flame retardation
[NASA-CASE-LAR-12099-1] N80-16158
A penalty plate-bending element for the analysis of laminated anisotropic composite plates
[AD-A074236] N80-16375

COMPOSITE STRUCTURES
Manufacturing processes for fabricating graphite/PMR 15 polyimide structural elements
[NASA-CR-159129] N80-16105
Aluminium or copper substrate panel for selective absorption of solar energy
[NASA-CASE-MFS-23518-3] N80-16452
Large, low cost composite wind turbine blades N80-16475
Spin test of the University of California, Lawrence Livermore Laboratory composite flywheel at the Applied Physics laboratory, The Johns Hopkins University, on 18 July 1978
[UCRL-13910] N80-16544

COMPRESSIBLE BOUNDARY LAYER
Nonparallel stability of three-dimensional compressible boundary layers. Part 1: Stability analysis
[NASA-CR-3245] N80-16296

COMPRESSIBLE FLOW
Predicting transition to turbulence in the compressible boundary layer flow over a spinning cone N80-16025
A general method to determine the stability of compressible flows N80-16026

COMPRESSIVE STRENGTH
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932

COMPRESSORS
JEFF(A) mixed-flow model fan performance optimization
[AD-A074571] N80-16234
Program to develop sprayed, plastically deformable compressor shroud seal materials
[NASA-CR-159741] N80-16338

COMPTON EFFECT
Compton scatter in germanium and its effect of imaging with gamma-ray position-sensitive detectors
[CONF-781028-1] N80-16923

COMPUTER COMPONENTS
Linking of the mini-computer Electronik-1001 and NR-9821A
[NASA-TM-75670] N80-16743

COMPUTER DESIGN
Development of panel methods for subsonic analysis and design
[NASA-CR-3234] N80-16033

COMPUTER GRAPHICS
Digital ultrasonic signal processing: Primary ultrasonics task and transducer characterization use and detailed description
[NASA-CR-161370] N80-16356
As-built design specification of software for cluster-based proportion estimation
[E80-10045] N80-16395
INFORM: An interactive data collection and display program with debugging capability
[NASA-TP-1424] N80-16742
VICAR image processing system guide to system use
[NASA-CR-162693] N80-16766
Computer image generation texture study — to enhance visual flight simulators
[AD-A074019] N80-16770
A comparison of some simple methods for extracting texture primitives and their effectiveness in texture discrimination
[AD-A073956] N80-16771
The development and application of environmental mapped data digitization, encoding, analysis, and display software for the ALICE system, volume 1
[ANL-79-71-VOL-1] N80-16780
Correcting the plotting symbol positioning error in Tektronix's GRAPH PLOT 50 software (4050A07 series B)
[UCID-18234] N80-16786

COMPUTER NETWORKS
Computer science and technology: A key notarization system for computer networks
[PB80-104698] N80-16787
Investigation of requirements and implementation of facilities for connecting UK hosts to Eurone
[BLL-BLRDR-5508] N80-16788
Facsimile techniques for on-line computer networks
[BLL-BLRDR-5506] N80-16789

COMPUTER PROGRAMMING
Theoretical modeling of coal and gas fired turbulent combustion and gasification processes N80-16176
Wizard: A string-oriented microprocessor operating system
[AD-A074704] N80-16744
Wizard programmer manual
[AD-A074528] N80-16745
An approach to the requirements analysis and specification of large-scale software systems N80-16757
Constructive extension and implementation of abstract data types and algorithms N80-16759
Software science and program complexity measures N80-16764
Symbolic-numeric interface: A review
[NASA-CR-162690] N80-16768
Data flow computing: Software development
[UCRL-83026] N80-16783
NCMART: Algorithms and computer codes for a modified algebraic spatial reconstruction of spectroscopic emissivities for ELMO bumpy torus
[ORNL/TM-6500] N80-16896

COMPUTER PROGRAMS
Development of panel methods for subsonic analysis and design
[NASA-CR-3234] N80-16033
An evaluation of the ADINA finite element program for application to aircraft overpressure vulnerability
[AD-A074261] N80-16056
Accuracy of hydrofoil loading predictions obtained from a lifting-surface computer program
[AD-A074702] N80-16233
Inelastic shear stresses and strains in the adhesives bonding lap joints loaded in tension or shear (computer program) — used in aircraft wing, fuselage, and furnishing components
[ESDU-79016] N80-16363
As-built design specification of software for cluster-based proportion estimation
[E80-10045] N80-16395
Collection and analysis of vegetative cover data — Hanford Site, Washington
[PNL-3068] N80-16412
A mathematical model of stratified, bidirectional flow in short culverts
[PB-300494/2] N80-16434
Continuing regional solar energy information mini-center activities and updating the SOLCOST program
[COO-4643-T2] N80-16521
The maximum likelihood approach to probabilistic modeling of air quality data
[PB80-104110] N80-16609
NCR Corporation, IMOS COBOL: Indexed I-O based X3.23-1974
[PB80-101868] N80-16752
An approach to the requirements analysis and specification of large-scale software systems N80-16757
Factors affecting computer program comprehension N80-16762
A variable metric algorithm for the solution of the singular three-dimensional missile avoidance
[TAE-353] N80-16765
VICAR image processing system guide to system use
[NASA-CR-162693] N80-16766
Symbolic Factorable SUMT: What is it, how is it used
[AD-A074903] N80-16769
BIOSAY: A computer program to store and report bioassay data
[UCID-17989] N80-16773
On-line programmer's management system. Addendum 2: Programmer's guide to the debugger
[AD-A074496] N80-16776
The development and application of environmental mapped data digitization, encoding, analysis, and display software for the ALICE system, volume 1
[ANL-79-71-VOL-1] N80-16780
EXPALS: FORTRAN code for exponential approximation by least squares
[UCRL-14541-REV-2] N80-16782
Correcting the plotting symbol positioning error in Tektronix's GRAPH PLOT 50 software (4050A07 series B)
[UCID-18234] N80-16786
Analysis and testing of numerical formulas for the initial value problem
[NASA-CR-162655] N80-16799
Computation of Hankel transforms using the fast-Fourier transform algorithms
[PB80-104045] N80-16812
THERPP: A Thermodynamic Properties Program
[TREE-1081-REV] N80-16929
A directory of computer software applications: Space technology
[PB-296039/1] N80-16958

A directory of computer software applications: Astronomy and astrophysics
[PB-294832/1] N80-16090

COMPUTER STORAGE DEVICES

Computer science and technology: A key notarization system for computer networks
[PB80-104698] N80-16787

COMPUTER SYSTEMS DESIGN

Computerized quality control techniques — and a computer systems design
[CONF-790707-11] N80-16361

An approach to the requirements analysis and specification of large-scale software systems
N80-16757

The representation of families of software systems
N80-16760

The design and implementation of user oriented systems N80-16795

COMPUTER SYSTEMS PROGRAMS

HOACOS: A program for adjusting horizontal networks in three dimensions
[PB-301351/3] N80-16432

INFORM: An interactive data collection and display program with debugging capability
[NASA-TP-1424] N80-16742

NCR Corporation, IMOS COBOL: Indexed I-O based X3.23-1974
[PB80-101868] N80-16752

The representation of families of software systems
N80-16760

Software science and program complexity measures N80-16784

The design and implementation of user oriented systems N80-16795

ALLS, a generalized crystallographic least squares program
[IS-4708] N80-16919

COMPUTER TECHNIQUES

Computerized quality control techniques — and a computer systems design
[CONF-790707-11] N80-16361

Computer-aided processing of LANDSAT MSS data for classification of forestlands — San Juan Mountains, Colorado
[E80-10043] N80-16393

Technology assessment: ADP installation performance measurement and reporting
[PB80-101322] N80-16751

Review of management information from computer-based circulation systems in academic libraries
[BLL-BLRDR-5471] N80-16935

COMPUTERIZED DESIGN

Application of numerical optimization to the design of wings with specified pressure distributions
[NASA-CR-3238] N80-16031

Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218

COMPUTERIZED SIMULATION

The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 1: Principles of operation
[AD-A074542] N80-16044

The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 2: Appendices to the principles of operation
[AD-A074482] N80-16045

Effects of secondary yield parameter variation on predicted equilibrium potential of an object in a charging environment — using computerized simulation
[NASA-TM-79299] N80-16093

A numerical model of high intensity confined hydrocarbon flames
[TAE-322] N80-16119

Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-9346] N80-16157

High G pyrotechnic shock simulation using metal-to-metal impact N80-16206

A maximum likelihood estimator for an exponential parameter from a life test with both type 1 and type 2 censoring
[AD-A073885] N80-16359

Simulation of MHD and steam cycle facility
[DOC-80SDS008] N80-16450

Computer modelling of amorphous materials for photovoltaic conversion
[DOE/TIC-10185] N80-16536

A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 1: Model formulation
[PB-300470/2] N80-16585

A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 2: User's manual
[PB-300471/9] N80-16586

A simulation model of estuarine subsystem coupling and carbon exchange with the sea N80-16609

QUARTZ: A numerical simulation of an asymmetric electrostatic accelerator
[CONF-790619-2] N80-16898

COMPUTERS

East Europe report: Scientific affairs, no. 658 — process computer technology and computer system reliability
[JPRS-74833] N80-16753

Process computer technology development reviewed N80-16754

Reliability rate of computer systems described N80-16755

CONCENTRATION (COMPOSITION)

Nitrogen dioxide vapor penetration of chlorobutyl rubber SCAPE under operational conditions
[NASA-TP-1605] N80-16118

Characteristics of very concentrated aqueous solutions
[LBL-9880] N80-16120

Combustion of multicomponent fuel droplets
[COO-4449-2] N80-16126

Preliminary evaluation of commercial continuous instrumentation for the measurement of viscosity and coal concentration of Coal-Oil Mixtures (COM)
[HCP/T2463-03] N80-16315

Remote sensing for diagnosing vapor dispersion in spills of liquid energy fuels
[UCID-18237] N80-16408

CONCENTRATORS

Evaluation of concentrated space solar arrays using computer modeling — for spacecraft propulsion and power supplies
[NASA-CR-162681] N80-16487

Solar energy concentrator design and operations. Citations from the NTIS data base
[NTIS/PS-79/0926/0] N80-16557

Solar energy concentrator design and operations. Citations from the Engineering Index data base
[NTIS/PS-79/0927/8] N80-16558

CONCRETES

Shrinkage-compensating cement for airport pavement, phase 2
[AD-A075739] N80-16197

Effectiveness of neoprene seals in preventing concrete pavement contraction joint deterioration
[PB-300594/9] N80-16244

Evaluation of experimental flexible pavements
[PB-310251/5] N80-16246

Evaluation of the effectiveness of fabric reinforcement in extending the in-service life of bituminous concrete overlays
[PB-301305/9] N80-16248

Aseismic design procedures for reinforced concrete frames. Seismic behavior and design of buildings
[PB80-104128] N80-16249

Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions
[PB-301091/5] N80-16252

Seismic behavior of reinforced concrete interior beam-column subassemblages
[PB-301326/5] N80-16254

Investigation of the suitability of the Bazant endochronic material model for modeling the concrete in a SAMSON analysis of a reinforced concrete beam
[AD-A074202] N80-16377

CONDENSERS (LIQUIFIERS)

Development of high temperature subtractive column and chromatographic analysis of hydrocarbons present in diesel exhaust
[BETC/RI-78/12] N80-16130

CONDENSING

Heavy hydrocarbons from coal gasification vapor pressures and dew point N80-16111

CONDUCTIVE HEAT TRANSFER

Application of the finite element method to the nonlinear inverse heat conduction problem using Beck's second method
[K/CSD/INF-78/20] N80-16308

CONFERENCES

Polymer materials basic research needs for energy applications: Proceedings of a Workshop Recommending Future Directions in Energy-Related Polymer Research
[CONF-780543] N80-16172

Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 1
[PB-299363/0] N80-16192

Proceedings: Symposium on coal cleaning to achieve energy and environmental goals held at Hollywood, Florida on September 1978, volume 2
[PB-299364/8] N80-16193

The Shock and Vibration Bulletin. Part 1: Invited papers, vibrations and acoustics, blast and shock
[NASA-CR-162471] N80-16198

Proceedings: Photovoltaics user Review Panel
[SERI/TP-99-276] N80-16514

Proceedings of the Second International Conference on Microzonation for Safer Construction: Research and application, volume 2
[PB-301144/2] N80-16888

Project skywater: Skywater conference 10, June 1978. The Sierra cooperative pilot project design
[PB-298529/9] N80-16896

The 1979 SIGNUM meeting on Numerical Ordinary Differential equations
[COO-2383-0058] N80-16810

Designing information: Some approaches, some problems and some suggestions — conference
[BLL-BLRDR-5509] N80-16839

Energy release in solar flares. Proceedings of the workshop on Energy Release in Flares
[PB-300805/7] N80-17010

CONFIDENCE LIMITS

Confidence intervals for an exponential parameter from a two stage life test — probability density functions
[AD-A073885] N80-16359

Approximate confidence intervals for an exponential parameter from a sequential life test
[AD-A073897] N80-16360

Confidence intervals for the common variance of equicorrelated normal random variables
[AD-A074339] N80-16800

Robust confidence intervals for the one- and two-sample problems N80-16817

CONFIGURATION INTERACTION

Studies of electron correlation in the photoionization process N80-16903

CONGRESSIONAL REPORTS

Space shuttle operational planning, policy and legal issues
[GPO-53-649] N80-16088

Gasohol: A technical memorandum
[PB80-105985] N80-16194

Federal demonstrations of solar heating and cooling on private residences: Only limited success
[PB-301123/8] N80-16555

Weather modification — congressional reports
[GPO-55-607] N80-16984

Department of Housing and Urban Development, and certain independent agencies appropriations for fiscal year 1980, part 1
[GPO-41-319] N80-16949

CONICAL BODIES

Predicting transition to turbulence in the compressible boundary layer flow over a spinning cone N80-16025

CONSTRUCTION MATERIALS

Manufacturing processes for fabricating graphite/PMR 15 polyimide structural elements
[NASA-CR-159129] N80-16105

CONTAMINANTS

Adsorption of energy-related organic pollutants: A literature review
[PB80-105117] N80-16595

CONTINENTAL SHELVES

Outer continental shelf environment monitoring concerns
[PB-299861/5] N80-16625

South Atlantic outer continental shelf geological studies, FY 1976
[PB-300822/4] N80-16701

South Atlantic outer continental shelf geological studies, FY 1976 — sediment transport over the south Atlantic ocean bottom
[PB-300820/8] N80-16702

On the propagation of free topographic Rossby waves near continental margins
[PB-299949/8] N80-16704

Temperature sections along the C-line over the shelf of Cabo Nazca, Peru from moored current meters, 18 March-10 May 1977 and CTD observations, 5 March-15 May 1977
[PB-301101/2] N80-16713

CONTROL EQUIPMENT
Means for controlling aerodynamically induced twist — equipment to control twisting of slender wings due to aerodynamic loads
[NASA-CASE-LAR-12175-1] N80-16055

CONTROL STABILITY
Control of large space structures
[NASA-CR-161369] N80-16062

CONTROLLERS
Control of large space structures
[NASA-CR-161369] N80-16062

Interface assembly for use in K 1520 system described N80-17019

CONVECTION
Natural convection in a vertical channel with heat and mass transfer and flow reversal N80-16291

A steady thermohaline convection model (driven by turbulent buoyant plumes from multiple isolated sources in a large nonturbulent finite region, with applications to the oceanic thermohaline circulation) N80-16698

CONVECTIVE FLOW
Combustion of multicomponent fuel droplets
[COO-4449-2] N80-16125

CONVECTIVE HEAT TRANSFER
Space shuttle base heating analysis
[NASA-CR-161375] N80-16089

Prediction of laminar and turbulent flow heat transfer in annular passages
[PB-299867/2] N80-16211

Step-by-step approach to convective cooling of laser disc amplifiers
[UCRL-15047] N80-16327

CONVOLUTION INTEGRALS
Numerical inversion of Laplace transforms
[AD-A074438] N80-16602

COOLING SYSTEMS
Prototype solar heating and combined heating cooling systems
[NASA-CR-161340] N80-16485

Solar-MEC development program, project 9103
[COO-4496-7] N80-16522

Cooling tower water conditioning study — using ozone
[NASA-CR-162891] N80-16576

COORDINATES
Results of a Loran-C flight test using an absolute data reference
[NASA-CR-162751] N80-16051

COPOLYMERS
Transport properties of chlorosulfonated block copolymers — to study the sorption and diffusion of water at various humidities N80-16160

COPPER
Scanning-electron-microscope study of normal-impingement erosion of ductile metals
[NASA-TP-1609] N80-16141

COPPER ALLOYS
X-ray pole figure analysis
[BOX-613-1629-REV] N80-16676

CORN
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394

CORRELATION
The simple atomic hopping problem. Particle correlation functions with application to dipolar induced spin lattice relaxation N80-16650

CORRIDORS
Transit corridor analysis. A manual sketch planning technique
[PB-301378/6] N80-16875

CORROSION
Localized corrosion and stress corrosion cracking behavior of austenitic stainless steel weldments containing retained ferrite
[COO-2462-5] N80-16149

Erosion-corrosion
[BNL-24884] N80-16154

CORROSION PREVENTION
Performance of Alternate Coatings in the Environment (PACE)
[PB-300868/7] N80-16174

CORROSION RESISTANCE
Corrosion behavior of Ni implanted steel N80-16138

Stress corrosion cracking evaluation of martensitic precipitation hardening stainless steels
[NASA-TM-78257] N80-16142

COSMIC RAYS
Energy spectra of cosmic ray nuclei to above 100 GeV/nucleon — measurement of energy spectra of cosmic ray nuclei boron to iron
[NASA-TM-80587] N80-17011

The unique cosmic event of 1979 March 5
[NASA-TM-80630] N80-17012

COST ANALYSIS
Continuing regional solar energy information mini-center activities and updating the SOLCOST program
[COO-4643-T2] N80-16521

Peak-load problem with storage technology — cost analysis of electric energy storage based on energy requirements
[ANL/SPG-8] N80-16549

Factors affecting potential market penetration of laser fusion power plants
[PNL-2803] N80-16552

A standard procedure for cost analysis of pollution control operations. Volume 1: User guide
[PB80-108038] N80-16619

A standard procedure for cost analysis of pollution control operations. Volume 2: Appendices
[PB80-108046] N80-16620

COST ESTIMATES
Oil and gas replacement cost: Development and production. Volume 1: Discussion of methodology, exhibits, and projections
[DOE/TIC-10078] N80-16187

Cost of energy evaluation N80-16482

A standard procedure for cost analysis of pollution control operations. Volume 2: Appendices
[PB80-108046] N80-16620

COSTS
An investigation of preferences for various types of energy cost feedback — information feedback system to determine energy consumption costs
[PB-300314/2] N80-16560

COUPLED MODES
An examination of coupled mode theory as applied to underwater sound propagation N80-16832

COUPLING
Turbulent dusty gas motions with weak statistical coupling
[UCRL-82131] N80-16307

COUPLINGS
Vehicle longitudinal control and reliability project. A review of entrainment technology
[PB-300372/0] N80-16955

CRACK PROPAGATION
A differential geometric approach to material deformation N80-16365

CRACKING (FRACTURING)
Tensile cracks in creeping solids
[COO-3084-64] N80-16388

CRACKS
Acoustoelastic analysis of center-cracked panels N80-16367

Effects of cracks on the response of shell structures — mathematical model
[CONF-790802-57] N80-16384

CREEP ANALYSIS
Development of a standard methodology for the correlation and extrapolation of elevated temperature creep and rupture data. Volume 2: A state-of-the-art review
[EPRI-FP-1062-VOL-2] N80-16152

CREEP PROPERTIES
Biaxial creep-fatigue behavior of type 316h stainless steel tube
[ANL-79-33] N80-16146

The use of stress change experiments to study the mechanisms of elevated temperature deformation N80-16371

Consistent creep and rupture properties for creep-fatigue evaluation — stainless steels
[CONF-781202-21] N80-16387

Tensile cracks in creeping solids
[COO-3084-64] N80-16388

CRITICAL FLOW
Second sound shock waves and critical velocities in liquid helium 2
[NASA-CR-162687] N80-16837

CRITICAL POINT
Heavy hydrocarbons from coal gasification vapor pressures and dew point N80-16111

Dynamics near the phase transitions in liquid crystals N80-16909

CRITICAL TEMPERATURE
Magnetic critical temperature gap in Gd-Y alloys
[ISM-228] N80-16916

CROP INVENTORIES
Large Area Crop Inventory Experiment (LACIE). Detailed description of the wheat acreage estimation procedure used in the Large Area Crop Inventory Experiment
[E80-10051] N80-16399

Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400

CRUDE OIL
Aggregated vectorial model of petroleum flow in the United States
[LBL-8874] N80-16178

Oil and gas replacement cost: Development and production. Volume 1: Discussion of methodology, exhibits, and projections
[DOE/TIC-10078] N80-16187

Petroleum production at maximum efficient rate, Naval Petroleum Reserve no. 1 (Elk Hills), Kern County, California
[DOE/EIS-0012] N80-16581

A review of standards of performance for new stationary sources: Petroleum refineries
[PB-300480/1] N80-16602

CRYOGENIC FLUID STORAGE
Producing slush oxygen with an auger and measuring the storage characteristics of slush hydrogen
[NASA-CR-158412] N80-16256

CRYOGENIC MAGNETS
Experiments on H2-O2MHD power generation
[NASA-TM-81424] N80-16886

CRYOGENIC WIND TUNNELS
Continuous self-locking spiral wound seal — for maintaining pressure between chambers in cryogenic wind tunnels
[NASA-CASE-LAR-12315-1] N80-16339

CRYSTAL GROWTH
Structural properties of NB3SN diffusion layers fabricated on single crystal Nb substrates
[AD-A074738] N80-16915

CRYSTAL LATTICES
Tests of new theories for crystal anharmonicity N80-16908

Equilibrium properties of the fluxoid lattice in single-crystal niobium
[CONF-790653-2] N80-16920

CRYSTAL STRUCTURE
Alteration of the superconducting properties of A15 compounds and elementary composite superconductors by non-hydrostatic elastic strain
[BNL-26400] N80-16282

Picosecond dynamics of energy transfer in pure and mixed organic crystals N80-16901

Low energy electron diffraction and auger electron spectroscopy studies of the structure and chemistry of iron single crystal surfaces N80-16902

An investigation of crystal surface structure by reflection electron diffraction N80-16910

Comparative low energy electron diffraction studies of InSb(110) and GaAs(110) surfaces N80-16911

Structural properties of NB3SN diffusion layers fabricated on single crystal Nb substrates
[AD-A074738] N80-16915

ALLS, a generalized crystallographic least squares program
[IS-4708] N80-16918

CRYSTAL SURFACES
Surface defects in weakly deformed single crystal silicon and their effect on interface properties of MOS capacitors N80-16913

CRYSTALLINITY
Crystalline polyimides — reinforcing fibers for high temperature composites and adhesives as well as flame retardation
[NASA-CASE-LAR-12099-1] N80-16158

CRYSTALLOGRAPHY
Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-9346] N80-16157
Light scattering studies of solids and atomic vapors
[LBL-8222] N80-16173
CUBIC LATTICES
Calculation of local fields in cubic lattices of polarizable atoms N80-16907
CUMULATIVE DAMAGE
Erosion-corrosion
[BNL-24884] N80-16154
CURRENT CONVERTERS (AC TO DC)
An ac/dc power converter for batteries and fuel cells
[EPRI-EM-662] N80-16284
CURRENT DENSITY
Diffusion length measurements of thin GaAs solar cells by means of energetic electrons
[NASA-CR-162692] N80-16489
CUSHIONS
An experimental design for total container impact response modeling at extreme temperatures
N80-16207
CUTTERS
Mechanical tunnel boring prediction and machine design
[PB80-101660] N80-16239
CYANATES
Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides --- flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116
CYANIDES
Development of a monitor for HCN in mobile source emissions
[PB80-100514] N80-16607
CYCLIC LOADS
Long-life fatigue test results for two nickel-base structural alloys
[KAPL-4105] N80-16150
CYCLOTRON RESONANCE
Finite temperature effect of ray tracing near the electron cyclotron resonance
[IPPJ-427] N80-16881
Axis encircling ion gyro-radius
[SAI-79-023-766-LJ] N80-16895
CYLINDRICAL SHELLS
The free vibration equations, natural frequencies and modal characteristics of closed circular cylindrical shells
[NAL-TR-569T] N80-16373
Initial imperfection measurements of integrally Stringer-stiffened cylindrical shells
[TAE-330] N80-16374
Effects of cracks on the response of shell structures --- mathematical model
[CONF-790802-57] N80-16384
CYLINDRICAL TANKS
Static tilt test of a tail cylindrical liquid storage tank
[PB-301167/3] N80-16255

D

DAMS
Hydrologic data on channel adjustments, 1970 to 1975, on the Rio Grande downstream from Cochiti Dam, New Mexico, before and after closure
[PB-301134/3] N80-16425
DATA ACQUISITION
Maximum likelihood identification of aircraft parameters with unsteady aerodynamic modelling
N80-16027
Geostationary operational environmental satellite/data collection system
[PB-301276/2] N80-16087
Technique to determine location of radio sources from measurements taken on spinning spacecraft
[NASA-TM-80598] N80-16260
Collection and analysis of vegetative cover data --- Hanford Site, Washington
[PNL-3068] N80-16412
DATA BASES
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Yellowstone National Park
[PB-301333/1] N80-16429
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Rocky Mountain National Park
[PB-301334/9] N80-16430
Fine particle emissions information system
[PB80-100449] N80-16588
CAB/cain evaluation project: A comparative study on the performance of two agricultural databases in a computerized current awareness service
[BLL-BLRDR-5483] N80-16941
DATA COMPRESSION
Evaluation of registration, compression, and classification algorithms. Volume 2: Documentation
[E80-10042] N80-16392
DATA CORRELATION
Development of a standard methodology for the correlation and extrapolation of elevated temperature creep and rupture data. Volume 2: A state-of-the-art review
[EPRI-FP-1062-VOL-2] N80-16152
DATA MANAGEMENT
A grouped binary time code for telemetry and space applications
[NASA-TM-80606] N80-16090
Experience in using the librarian as an aid in managing large-scale data bases
[K/CSD/INF-78/4] N80-16937
DATA PROCESSING
Weighting in digital synthetic aperture radar processing
[NASA-CR-162684] N80-16263
Technology assessment: ADP installation performance measurement and reporting
[PB80-101322] N80-16751
East Europe report: Scientific affairs, no. 658 --- process computer technology and computer system reliability
[JPRS-74833] N80-16753
Process computer technology development reviewed N80-16754
Data flow computing: Software development
[UCRL-83026] N80-16763
Analysis of solar wind data from the SOLRAD 11A and 11B spacecraft
[AD-A070945] N80-17008
DATA REDUCTION
Solar availability for winter space heating: An analysis of the calendar period 1953-1975
[ANL/SPG-14] N80-16532
Minicomputer-base interactive image processing
[LA-UR-79-1912] N80-16779
Analysis of solar wind data from the SOLRAD 11A and 11B spacecraft
[AD-A070945] N80-17008
DATA RETRIEVAL
BIOSAY: A computer program to store and report bioassay data
[UCID-17989] N80-16773
DATA STORAGE
Experience in using the librarian as an aid in managing large-scale data bases
[K/CSD/INF-78/4] N80-16937
DATA SYSTEMS
BIOSAY: A computer program to store and report bioassay data
[UCID-17989] N80-16773
DECISION MAKING
Heuristic decision rules for water resources planning
[PB-300578/2] N80-16435
Optimal information acquisition for randomly occurring decisions
[AD-A074956] N80-16804
Overall city technology process
[PB-301109/5] N80-16969
DEFECTS
Initial imperfection measurements of integrally Stringer-stiffened cylindrical shells
[TAE-330] N80-16374
DEFORMATION
A differential geometric approach to material deformation N80-16365
The use of stress change experiments to study the mechanisms of elevated temperature deformation
N80-16371
DEGASSING
Study of hydrocarbon-shale interaction
[ORO-5197-14] N80-16409
DEGREES OF FREEDOM
Stability analysis and response characteristics of two-degree of freedom nonlinear systems
N80-16225
DELTA WINGS
Summary of theoretical and experimental investigations of vortex lift at high angles of attack
[AD-A074483] N80-16037
DELTAS
The Yallahs fan delta, southeastern Jamaica: A depositional model for active tectonic coastlines
N80-16632
DENSE PLASMAS
Production and diagnostics of dense nuclear plasmas
[NASA-CR-162656] N80-16884
DENSITY (MASS/VOLUME)
Estimation of the density of organic explosives from their structural formulas
[LA-7760-MS] N80-16188
DEPOSITION
Preparation of thin films for solar energy utilization
[SAND-79-1754C] N80-16517
DESALINIZATION
Development of dry process microporous polysulfone supports for ultrathin film composites
[PB-300488/4] N80-16133
Pretreatment of seawater for reverse osmosis processes, 1976
[PB-300509/7] N80-16134
DESCENT
Experimental evaluation of active and passive means of alleviating rotor impulsive noise in descent flight
[NASA-CR-159188] N80-16839
DESIGN ANALYSIS
Design considerations for attaining 200-knot test velocities at the aircraft landing loads and traction facility
[NASA-TM-80096] N80-16071
Design of disc cams with translating roller followers: Calculation methods
[ESDU-79007] N80-16335
Design evolution of large wind turbine generators
N80-16455
Design characteristics of the 224 kW Magdalen Islands VAWT N80-16463
Overview of Vertical Axis Wind Turbine (VAWT)
N80-16466
Heliostat beam characterization system-calibration technique --- the design analysis and calibration techniques of heliostats using video equipment
[SAND-79-1532C] N80-16531
Application analysis and photovoltaic system conceptural design for service/commercial/institutional and industrial sectors, task 1 report
[SAND-78-7032] N80-16550
Performance evaluation of the New Mexico State University solar house
[PB-301225/9] N80-16553
Design of a reflection on apparatus for laser beam profile measurements
[PB80-101256] N80-16877
DESULFURIZING
Status of pollutant removal technology for coal fired plants in the northeastern U.S.
[BNL-51004] N80-16580
DETONABLE GAS MIXTURES
Chemical kinetics in LNG detonations
[UCRL-82293-REV-1] N80-16180
DETONATION
Chemical kinetics in LNG detonations
[UCRL-82293-REV-1] N80-16180
A computational model describing the initiation of silver acetylide-silver nitrate explosive by an intense light source N80-16228
DEUTERIUM
The temperature and density dependence of the nuclear spin-spin interaction in HD gas and fluid
N80-16848
DEUTERONS
Mossbauer measurements on low temperature deuteron implanted Al(Co57) N80-16906
DEW
Molecular thermodynamics of dew-point calculations in coal gasification processes N80-16926
DIAGNOSIS
Use of lasers for accelerator diagnostics. 1: Elementary concepts
[LA-UR-79-2329] N80-16324

DIELECTRIC PROPERTIES
Dielectric and pyroelectric properties of ferroelectrics N80-16275
The dielectric properties of soil-water mixtures at microwave frequencies
[NASA-TM-80597] N80-16403
DIELECTRICS
Statistical analysis of absorptive laser damage in dielectric thin films
[UCRL-81670] N80-16325
DIESEL ENGINES
Combustion optimization studies for stratified charge and diesel engines
[COO-4191-2] N80-16346
Engine combustion technology overview
[SAND-78-8801] N80-16347
DIESEL FUELS
Development of high temperature subtractive column and chromatographic analysis of hydrocarbons present in diesel exhaust
[BETC/RI-78/12] N80-16130
DIETS
Influence of x irradiation and diet on pituitary/thyroid function in the rat
[UR-3490-1674] N80-16722
DIFFERENTIAL EQUATIONS
Analysis and testing of numerical formulas for the initial value problem
[NASA-CR-162655] N80-16799
Generalized Adams methods — for underwater acoustic wave propagation problem
[AD-A074548] N80-16801
The 1979 SIGNUM meeting on Numerical Ordinary Differential equations
[COO-2383-0058] N80-16810
DIFFERENTIAL GEOMETRY
A differential geometric approach to material deformation N80-16365
DIFFUSION
Irrigation practices and return flow salinity in Grand Valley
[PB80-103609] N80-16416
Structural properties of NB3SN diffusion layers fabricated on single crystal Nb substrates
[AD-A074738] N80-16915
DIFFUSION COEFFICIENT
Theoretical study of a reaction-diffusion model for flame propagation in a gas
[LBL-9487] N80-16128
Application of a diffusion model to oxide sintering
[PB-300399/3] N80-16238
DIFFUSIVITY
Measurement of eddy diffusivity and solute transport through the near-sediment boundary layer of ice-covered lakes, using Radon-222 N80-16390
DIGITAL DATA
A statistical analysis for digital field strength data
[BBC-RD-1979/24] N80-16276
The development and application of environmental mapped data digitization, encoding, analysis, and display software for the ALICE system, volume 1
[ANL-79-71-VOL-1] N80-16780
DIGITAL FILTERS
Stochastic filtering and control
[AD-A074258] N80-16820
DIGITAL SYSTEMS
Digital adaptive controllers for VTOL vehicles. Volume 1: Concept evaluation
[NASA-CR-159154-VOL-1] N80-16065
Digital adaptive controllers for VTOL vehicles. Volume 2: Software documentation
[NASA-CR-159154-VOL-2] N80-16066
Digital ultrasonic signal processing: Primary ultrasonics task and transducer characterization use and detailed description
[NASA-CR-161370] N80-16358
DIGITAL TECHNIQUES
Weighting in digital synthetic aperture radar processing
[NASA-CR-162684] N80-16263
DIGITAL TELEVISION
Digital recording using hologram arrays: Some initial experiments in 100 M bit/s recording
[BBC-RD-1979/23] N80-16312
DIMENSIONAL ANALYSIS
Scaling of some flowfields with flames — internal combustion engines
[CONF-7811102-2] N80-16305
DIRECTIONAL SOLIDIFICATION (CRYSTALS)
X-ray pole figure analysis
[BDX-613-1829-REV] N80-16876
DIRICHLET PROBLEM
The Dirichlet problem for quasilinear elliptic equations with lower regularity at the boundary N80-16792
Distributional results for random functionals of a Dirichlet process
[AD-A074698] N80-16818
DISCRETE ADDRESS BEACON SYSTEM
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 1: Principles of operation
[AD-A074542] N80-16044
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 2: Appendices to the principles of operation
[AD-A074482] N80-16045
DISCRETE FUNCTIONS
Baseline correction of earthquake records in the frequency domain
[PB80-102056] N80-16659
DISLOCATIONS (MATERIALS)
Dislocation model for twinning and fracture and its application to HCP metals
[CONF-790801-3] N80-16148
DISPLAY DEVICES
Multi-modal information processing for visual workload relief
[NASA-CR-162720] N80-16737
Mirror position display equipment for the target chamber mirror mounts of the LASL Helios laser fusion facility
[LA-UR-79-569] N80-16894
Designing information: Some approaches, some problems and some suggestions — conference
[BLL-BLRDR-5509] N80-16938
The use of form designs for catalogue input: A project involving the HP2645A display station
[BLL-BLRDR-5501] N80-16946
DISTILLATION
Conversion of isotope compounds to metal by reduction-distillation methods
[CONF-780943-2] N80-16125
DOMESTIC ENERGY
Comparative assessment of residential energy supply systems that use fuel cells: Executive summary — domestic energy supply systems analysis of coal fired power plants using fuel cells
[PB-299207/1] N80-16564
Comparative assessment of residential energy supply systems that use fuel cells
[PB-299208/9] N80-16565
DOPED CRYSTALS
Formation of supersaturated alloys by ion implantation and pulsed-laser annealing N80-16137
DOPPLER RADAR
Rapid-scanning measurements of wind-produced doppler on an asymmetrical microwave transhorizon propagation path N80-16674
DRAG REDUCTION
Wing flapping with minimum energy — minimize the drag for a bending moment at the wing root
[NASA-TM-81174] N80-16035
A study of aerodynamic methods for improving truck fuel economy
[PB80-101272] N80-16040
Analytical and design techniques for drag reduction studies on wavy surfaces — Navier-Stokes equation
[NASA-CR-3225] N80-16297
An experimental investigation of the effect of drag reducing polymer additives on surface pressure fluctations on bodies of revolution with rough surfaces moving through water
[AD-A073836] N80-16302
DRAINAGE
Effect of subbase type and subsurface drainage on behavior of CRC pavements
[PB80-101165] N80-16240
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438
DROP TESTS
An experimental design for total container impact response modeling at extreme temperatures N80-16207
Shock response of non-linear systems N80-16224
DROPS (LIQUIDS)
Combustion of multicomponent fuel droplets
[COO-4449-2] N80-16126
Stability analysis of interfacial circulation on a static liquid drop with forced internal circulation N80-16290
The effect of superheating on the performance of floating droplet direct contact heat exchangers N80-16293
Drag force on a conductive spherical drop in a nonuniform magnetic field
[ORNL/TM-6976] N80-16830
DUST
Improved light scattering dust monitor
[PB-299938/1] N80-16445
DYNAMIC CHARACTERISTICS
The effects of strain rate and strain history on the dynamic behavior of metallic materials N80-16140
Limitations and corrections in measuring dynamic characteristics of structural systems
[SAND-78-1015] N80-16386
DYNAMIC LOADS
On the use of coherence functions to evaluate sources of dynamic excitation N80-16201
A stability theorem for a dynamically loaded linear viscoelastic structure N80-16230
Analytical method for determining seismic response of cooling towers on footing foundations
[PB-301398/3] N80-16250
Dynamic analysis of shells of revolution-soil systems N80-16368
Limitations and corrections in measuring dynamic characteristics of structural systems
[SAND-78-1015] N80-16386
DYNAMIC MODELS
Aerodynamic coefficient estimation by means of an extended Kalman filter — to study dynamic models of reentry vehicle motion
[SAND-79-0411C] N80-16039
DYNAMIC RESPONSE
On the use of coherence functions to evaluate sources of dynamic excitation N80-16201
The effects of frequency, amplitude, and load on the dynamic properties of elastomers N80-16221
Shock response of non-linear systems N80-16224
Stability analysis and response characteristics of two-degree of freedom nonlinear systems N80-16225
Application of random time domain analysis to dynamic flight measurements — B-1 aircraft N80-16226
Shock spectra design methods for equipment-structure systems N80-16227
Analog double integration of shock pulses N80-16231
A differential geometric approach to material deformation N80-16365
Dynamic yielding of polycrystalline materials under biaxial loading N80-16366
Steady state response of a circular foundation on a transversely isotopic medium N80-16369
Identification, detection and validation of vibrating structures: A signal processing approach
[UCID-18270] N80-16383
Effects of cracks on the response of shell structures — mathematical model
[CONF-790802-57] N80-16384
DYNAMIC STABILITY
The Shock and Vibration Bulletin. Part 2: Modal and impedance analysis, human response to vibration and shock, isolation and damping, dynamic analysis
[NASA-CR-162472] N80-16211
DYNAMIC STRUCTURAL ANALYSIS
Shock spectra design methods for equipment-structure systems N80-16227
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions
[PB-301091/5] N80-16252
DYNAMIC TESTS
Evaluation of experimental flexible pavements
[PB-310251/5] N80-16246

E

E REGION
Analysis of numerical ionograms. 3: The valley program
[IPS-X8] N80-16848

EARTH ATMOSPHERE
The mechanism of temperature and pressure changes in the Earth's atmosphere during solar flares
[NASA-TM-75349] N80-17007

EARTH CORE
Physics of mantle and core minerals — Hugoniot data N80-16836

EARTH MANTLE
Plate motions relative to the paleomagnetic axis and the lower mantle N80-16835
Physics of mantle and core minerals — Hugoniot data N80-16836

EARTH MOVEMENTS
Plate motions relative to the paleomagnetic axis and the lower mantle N80-16835

EARTH ORBITS
Orbits near critical inclination, including lunisolar perturbations N80-16079
Electric propulsion for near-Earth space missions
[NASA-CR-159735] N80-16096

EARTH RESOURCES
Helium resources of the United States, 1977
[PB80-101744] N80-16426

EARTH SURFACE
Experimental results from the solar ground coupling research facility at Brookhaven National Laboratory — heat transfer and storage devices for a solar source heat pump system
[BNL-26219] N80-16509

EARTHQUAKE RESISTANT STRUCTURES
Aseismic design procedures for reinforced concrete frames. Seismic behavior and design of buildings
[PB80-104128] N80-16249
Analytical method for determining seismic response of cooling towers on footing foundations
[PB-301398/3] N80-16250
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions
[PB-301091/5] N80-16252
Investigation of the nonlinear characteristics of a three story steel frame using system
[PB-301363/8] N80-16253
Seismic behavior of reinforced concrete interior beam-column subassemblages
[PB-301326/5] N80-16254
Dynamic analysis of shells of revolution-soil systems N80-16366
Potential utilization of the NASA/George C. Marshall Space Flight Center in earthquake engineering research
[NASA-CR-161371] N80-16650
Proceedings of the Second International Conference on Microzonation for Safer Construction: Research and application, volume 2
[PB-301144/2] N80-16668

EARTHQUAKES
Probabilistic seismic stability analysis: A case study
[PB-301291/1] N80-16655
A probabilistic model for seismic slope stability analysis
[PB-301369/5] N80-16656
Baseline correction of earthquake records in the frequency domain
[PB80-102058] N80-16659
Earthquake history of the United States, 1971 - 1976 supplement
[PB80-108434] N80-16661
Earthquake waves in a random medium — analyzed using mathematical models
[PB80-104862] N80-16662
Homogeneous magnitude system of the Eurasian continent: P waves
[PB-301282/0] N80-16666
ARMA models for earthquake ground motions
[PB-301168/5] N80-16667

EAST GERMANY
East Europe report: Scientific affairs, no. 659
[JPRS-74911] N80-17015
Microcomputer system K 1520 examined N80-17020

ECONOMIC ANALYSIS
Economics of geothermal power
[COO-4051-43] N80-16437
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 1: Executive summary
[SAND-78-0962-VOL-1] N80-16539
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 2: Economic optimization model
[SAND-78-0962-VOL-2] N80-16540
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 3: Point designs
[SAND-78-0962-VOL-3] N80-16541
Economic analysis of Darrieus axis wind turbine systems for the generation of utility grid electrical power. Volume 4: Summary and analysis of the A. T. Kearney and Alcoa Laboratories point design economic studies
[SAND-78-0962-VOL-4] N80-16542

ECONOMIC DEVELOPMENT
Balancing the objectives of clean air and economic growth: Regulated markets in emission reductions
[PB-300805/6] N80-16598
Space benefits: The secondary application of aerospace technology in other sectors of the economy
[NASA-CR-162597] N80-16950

ECONOMIC FACTORS
Transportation needs for the elderly, handicapped and low income of Mississippi
[PB-301273/9] N80-16671

ECOSYSTEMS
Oxidant air pollution impact to the forests of eastern United States: A literature review
[PB80-103500] N80-16589
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16708
Coastal upwelling ecosystems analysis. Nitrate reductase activity in the North West African upwelling area
[PB-301030/3] N80-16707
Coastal upwelling ecosystems analysis. Interactions of primary nutrient and carbon uptake in the Peru current: A review and synthesis of laboratory and field results
[PB-301031/1] N80-16708
Utilization of natural ecosystems for wastewater renovation
[PB80-100431] N80-16962

EDDY CURRENTS
The development of quantitative NDI for retirement-for-cause
[AD-A068403] N80-16355

EDGE LOADING
Composite materials research and education program: The NASA-Virginia Tech composites program
[NASA-CR-162719] N80-16101

EFFLUENTS
Fine particle emissions information system
[PB80-100449] N80-16598

EIGENVECTORS
Two-dimensional eigenmode analysis of the trapped-ion instability N80-16878

ELASTIC BENDING
Influences of the couple-stresses on the pure-bending of a circular cylinder
[GA-A-15141] N80-16395

ELASTIC BODIES
Study of foldable elastic tubes for large space structure applications; phase 1
[NASA-CR-162652] N80-16083

ELASTIC DEFORMATION
Elastic and plastic strains and the stress corrosion cracking of austenitic stainless steels
[COO-2576-9] N80-16144
Alteration of the superconducting properties of A15 compounds and elementary composite superconductors by non-hydrostatic elastic strain
[BNL-26400] N80-16282
Effects of cracks on the response of shell structures — mathematical model
[CONF-790802-57] N80-16384

ELASTIC MEDIA
Some approximations in vibrations and wave motion of elastic media N80-16364

ELASTIC PROPERTIES
Prediction of fiber composite mechanical behavior made simple — using a rocket calculator
[NASA-TM-81404] N80-16107
Acoustoelastic analysis of center-cracked panels N80-16367
Structure inelasticity 24. Examples of non-uniqueness in contained plastic deformation
[AD-A074727] N80-16380

ELASTIC SCATTERING
Interactions of molecules with surfaces
[COO-4974-1] N80-16861

ELASTOHYDRODYNAMICS
Thermal elastohydrodynamic lubrication of spur gears
[NASA-CR-3241] N80-16337

ELASTOMERS
Perfluoroether triazine elastomers
[NASA-CR-162748] N80-16166
Phosphonitrilic fluoroelastomer coated fabrics for collapsible fuel storage tanks
[AD-A074824] N80-16167
A simple low-cost technique for measuring material damping behavior N80-16220
The effects of frequency, amplitude, and load on the dynamic properties of elastomers N80-16221
A generalized derivative model for an elastomer damper N80-16223
Physical testing of polymers for use in circulatory assist devices
[PB80-101546] N80-16740

ELECTRIC AUTOMOBILES
Electric automobiles. Citations from the NTIS data base — and their propulsion systems
[NTIS/PS-79/0990/6] N80-16976

ELECTRIC BATTERIES
An ac/dc power converter for batteries and fuel cells
[EPRI-EM-862] N80-16284
Electric automobiles. Citations from the NTIS data base — and their propulsion systems
[NTIS/PS-79/0990/6] N80-16976

ELECTRIC CONDUCTORS
Drag force on a conductive spherical drop in a nonuniform magnetic field
[ORNL/TM-6976] N80-16830

ELECTRIC ENERGY STORAGE
Peak-load problem with storage technology — cost analysis of electric energy storage based on energy requirements
[ANL/SPG-8] N80-16549

ELECTRIC FIELDS
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air N80-16257
Electrostatic filters generated by electric fields
[UCRL-81926] N80-16283
Biological effects of high-voltage electric fields. Volume 1: An update
[EPRI-EA-1123] N80-16730
Calculation of local fields in cubic lattices of polarizable atoms N80-16907

ELECTRIC FILTERS
Electrostatic filters generated by electric fields
[UCRL-81926] N80-16283

ELECTRIC GENERATORS
Shaft torsional oscillations of hydrogenerators
[PB80-102155] N80-16286
Large Wind Turbine Design Characteristics and R and D Requirements
[NASA-CP-2106] N80-16453
The General Electric MOD-1 wind turbine generator program N80-16456
The Boeing MOD-2 wind tunnel system rated at 2.5 MW N80-16457
WTG Energy Systems' MP1-200 200 kilowatt wind turbine generator — a fixed pitch rotor configuration driving a synchronous generator N80-16458
Specification, siting and selection of large WECS prototypes N80-16459
The Danish large wind turbine program — feasibility of wind power in a utility grid N80-16460
Large wind energy converter: Growian 3 MW N80-16461
Characteristics of future Vertical Axis Wind Turbines (VAWTs) — to generate utility grid electric power N80-16462

Status of the Southern California Edison Company 3 MW Wind Turbine Generator (WTG) demonstration project N80-16478

Results of a utility survey of the status of large wind turbine development N80-16479

Simulation studies of multiple large wind turbine generators on a utility network N80-16480

Fixed mirror solar concentrator for application to a 100 MW(e) electric generating plant
[GA-A-15340] N80-16508

Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 1: Executive summary
[SAND-78-0962-VOL-1] N80-16539

Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 2: Economic optimization model
[SAND-78-0962-VOL-2] N80-16540

Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 3: Point designs
[SAND-78-0962-VOL-3] N80-16541

Economic analysis of Darrieus axis wind turbine systems for the generation of utility grid electrical power. Volume 4: Summary and analysis of the A. T. Kearney and Alcoa Laboratories point design economic studies
[SAND-78-0962-VOL-4] N80-16542

ELECTRIC HYBRID VEHICLES

Electric automobiles, volume 2. Citations from the Engineering Index data base
[NTIS/PS-79/0991/4] N80-16977

ELECTRIC MOTOR VEHICLES

An averaging battery model for a lead-acid battery operating in an electric car
[NASA-TM-79321] N80-16824

Electric automobiles. Citations from the NTIS data base --- and their propulsion systems
[NTIS/PS-79/0990/6] N80-16976

Electric automobiles, volume 2. Citations from the Engineering Index data base
[NTIS/PS-79/0991/4] N80-16977

ELECTRIC NETWORKS

Simulation studies of multiple large wind turbine generators on a utility network N80-16480

ELECTRIC POTENTIAL

Improving the voltage holdoff performance of alumina insulators in vacuum through quasimetallizing
[GEPP-TIS-441] N80-16285

ELECTRIC POWER PLANTS

Simulation of MHD and steam cycle facility
[DOC-80SDS006] N80-16450

The Danish large wind turbine program --- feasibility of wind power in a utility grid N80-16460

Characteristics of future Vertical Axis Wind Turbines (VAWTs) --- to generate utility grid electric power N80-16462

Economics of geothermal power
[COO-4051-43] N80-16497

Use of solar energy for the production of electricity in the Alps
[SAND-79-6000] N80-16499

Status of pollutant removal technology for coal fired plants in the northeastern U.S.
[BNL-51004] N80-16580

ELECTRIC POWER TRANSMISSION

Biological effects of high-voltage electric fields. Volume 1: An update
[EPRI-EA-1123] N80-16730

ELECTRIC PROPULSION

Upper stages utilizing electric propulsion
[NASA-TM-81412] N80-16097

Electric automobiles. Citations from the NTIS data base --- and their propulsion systems
[NTIS/PS-79/0990/6] N80-16976

ELECTRIC ROCKET ENGINES

Electric propulsion for near-Earth space missions
[NASA-CR-159735] N80-16096

ELECTRICAL ENGINEERING

East Europe report: Scientific affairs, no. 659
[JPRS-74911] N80-17015

ELECTRICAL INSULATION

Novel approaches for alleviation of electrical hazards of graphite-fiber composites --- aircraft safety
[NASA-CR-162683] N80-16100

ELECTRICAL PROPERTIES

Improving the voltage holdoff performance of alumina insulators in vacuum through quasimetallizing
[GEPP-TIS-441] N80-16285

Characterization of solar cells for space applications. Volume 11: Electrical characteristics of 2 ohm-cm, 228 micron wraparound solar cells as a function of intensity, temperature, and irradiation --- for solar electric propulsion
[NASA-CR-162686] N80-16486

Carrier transport through heterojunction solar cells
[DOE/ET/23103-5] N80-16534

Surface defects in weakly deformed single crystal silicon and their effect on interface properties of MOS capacitors N80-16913

ELECTRICAL RESISTANCE

Characteristics of very concentrated aqueous solutions
[LBL-9660] N80-16120

Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074656] N80-16278

Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074655] N80-16279

ELECTRO-OPTICS

Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218

ELECTROCHEMISTRY

Electrochemistry of acetylides, nitrides and carbon cathodes in molten halides
[COO-4445-T1] N80-16121

Photochemical energy storage, studies of inorganic photoassistance agents
[COO-4178-2] N80-16526

ELECTROMAGNETIC COMPATIBILITY

A compatibility analysis of spread-spectrum and FM land mobile radio systems
[PB-300651/7] N80-16268

ELECTROMAGNETIC FIELDS

Some fundamental considerations of the equation of radiative transfer
[ORO-3992-345] N80-16266

ELECTROMAGNETIC PROPULSION

An evaluation of direct current electromagnetic propulsion in seawater
[AD-A074830] N80-16280

ELECTROMAGNETIC PULSES

FAA lightning protection study: Report of investigations relative to providing lightning protection for the Remote Center Air-to-Ground (RCAG)
[AD-A076943] N80-16259

ELECTROMAGNETIC RADIATION

On the generation of auroral kilometric radiation N80-16644

ELECTROMAGNETIC SCATTERING

Electromagnetic scattering by two bodies of revolution N80-16277

ELECTRON BEAM WELDING

Development of automated welding processes for field fabrication of thick-walled pressure vessel: Electron beam method
[DOE/ET-2606/3] N80-16348

ELECTRON BEAMS

Pinched relativistic electron beams and collective acceleration of ions N80-16274

Review of electron-beam heating of magnetic mirror confined plasmas, with application to the Tanden Mirror Experiment
[UCRL-52759] N80-16890

ELECTRON BOMBARDMENT

Radiation from Ag and K film bombarded by low energy electrons
[ORNL/TM-6527] N80-16859

ELECTRON DENSITY PROFILES

Analysis of numerical ionograms. 3: The valley program
[IPS-X8] N80-16648

ELECTRON DIFFRACTION

Low energy electron diffraction and auger electron spectroscopy studies of the structure and chemistry of iron single crystal surfaces N80-16902

An investigation of crystal surface structure by reflection electron diffraction N80-16910

Comparative low energy electron diffraction studies of InSb(110) and GaAs(110) surfaces N80-16911

ELECTRON DIFFUSION

Diffusion length measurements of thin GaAs solar cells by means of energetic electrons
[NASA-CR-162692] N80-16489

ELECTRON ENERGY

Analysis of the Z dependence of laser generated suprathermal electron temperature
[UCRL-82280] N80-16330

Radiation from Ag and K film bombarded by low energy electrons
[ORNL/TM-6527] N80-16859

Pulse pileup effects of plasma electron temperature measurements by soft X-ray energy analysis
[ORNL/TM-6541] N80-16867

ELECTRON MICROSCOPY

Scanning-electron-microscope study of normal-impingement erosion of ductile metals
[NASA-TP-1609] N80-16141

ELECTRON MOBILITY

Theoretical studies of excess electron mobilities and change-transfer spectra N80-16841

ELECTRON PARAMAGNETIC RESONANCE

Theoretical studies of the light reactions in photosynthesis N80-16717

ELECTRON PRECIPITATION

On the generation of auroral kilometric radiation N80-16644

ELECTRON SCATTERING

Low energy electron vibrational excitation of molecules adsorbed on surfaces: Experiment and theory N80-16842

Studies of electron correlation in the photoionization process N80-16903

ELECTRON SOURCES

Study of energetic electrons in the outer radiation-belt regions using data obtained by the LLL spectrometer on OGO-5 in 1968
[UCRL-52807] N80-17013

ELECTRON SPECTROSCOPY

The development and utilization of inelastic electron tunneling spectroscopy as a tool for investigating fundamental catalytic processes N80-16113

Low energy electron diffraction and auger electron spectroscopy studies of the structure and chemistry of iron single crystal surfaces N80-16902

ELECTRON TRANSFER

Theoretical and experimental square wave voltammetry N80-16273

Theoretical studies of excess electron mobilities and change-transfer spectra N80-16841

ELECTRON TRANSITIONS

High resolution spectroscopy of the hydrogen Balmer-alpha line N80-16848

ELECTRON TUNNELING

The development and utilization of inelastic electron tunneling spectroscopy as a tool for investigating fundamental catalytic processes N80-16113

The interface state effects and characterization of MIS solar cells --- describing the charge carrier mechanisms and electron tunneling behavior N80-16451

ELECTRONIC EQUIPMENT

Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074656] N80-16278

ELECTRONS

Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 1: Estimate of the electron velocity distribution functions
[NASA-CR-162696] N80-16851

Finite temperature effect of ray tracing near the electron cyclotron resonance
[IPPJ-427] N80-16881

ELECTROPHORESIS

Method for separating biological cells --- suspended in aqueous polymer systems
[NASA-CASE-MFS-23883-1] N80-16715

ELECTROSTATIC DRAG

Drag force on a conductive spherical drop in a nonuniform magnetic field
[ORNL/TM-6976] N80-16830

ELECTROSTATICS

Electrostatic filters generated by electric fields
[UCRL-81926] N80-16283

QUARTZ: A numerical simulation of an asymmetric electrostatic accelerator
[CONF-790619-2] N80-16868

ELEMENTARY PARTICLE INTERACTIONS
The production of neutrinos and neutrino-like particles in proton-nucleus interactions N80-16847
New directions in elementary particle physics: P anti p from very low to very high energies --- review of particle theory which includes particle collisions, particle energies, and elementary particle interactions
[BNL-26515] N80-16855
Research in elementary particle physics
[COO-3230-2] N80-16856
ELEMENTARY PARTICLES
Research in elementary particle physics
[COO-3230-2] N80-16856
ELLIPTIC DIFFERENTIAL EQUATIONS
The Dirichlet problem for quasilinear elliptic equations with lower regularity at the boundary
N80-16792
EMISSION SPECTRA
X-ray observations of a compact binary source
[NASA-CR-162750] N80-16989
ENCLOSURES
Numerical solution of three-dimensional natural convection by the strongly implicit procedure
[DP-MS-78-14] N80-16310
ENDOSCOPES
Apparatus for endoscopic examination --- analysis of the propulsion system configuration and transmitter
[NASA-CASE-NPO-14092-1] N80-16725
ENERGY
Energy: A continuing bibliography with indexes, issue 23
[NASA-SP-7043(23)] N80-16449
ENERGY ABSORPTION
Preliminary experimental results on the optical properties of model direct solar gain interiors
[ISM-233] N80-16519
ENERGY ABSORPTION FILMS
Preparation of thin films for solar energy utilization
[SAND-79-1754C] N80-16517
Photovoltaic Materials and Device Measurements Workshop: Focus on polycrystalline thin film cells
[SERI/TP-49-185] N80-16538
ENERGY CONSERVATION
A study of aerodynamic methods for improving truck fuel economy
[PB80-101272] N80-16040
Energy savings through use of an improved reduction cell cathode
[SAN-1257-T2] N80-16515
Energy conservation in industry: The present approach, the future opportunities
[PB-301244/0] N80-16556
Simplified procedure for calculating the effects of daylight from clear skies
[LBL-9048] N80-16695
ENERGY CONSUMPTION
Aggregated vectorial model of petroleum flow in the United States
[LBL-8874] N80-16178
Energy and materials flows in the fabrication of aluminum products
[ANL/CNSV-3] N80-16237
Energy savings through use of an improved reduction cell cathode
[SAN-1257-T2] N80-16515
An investigation of preferences for various types of energy cost feedback --- information feedback system to determine energy consumption costs
[PB-300314/2] N80-16560
ENERGY CONVERSION
Development studies on selected conversion of synthesis gas from coal to high octane gasoline
[FE-2276-27] N80-16190
Large Wind Turbine Design Characteristics and R and D Requirements
[NASA-CP-2106] N80-16453
Large wind energy converter: Growian 3 MW
N80-16461
Preliminary analysis of performance and loads data from the 2-megawatt mod-1 wind turbine generator
[NASA-TM-81408] N80-16494
Flywheel energy storage and conversion system for photovoltaic applications
[COO-4094-57] N80-16501
Workshop on Power Conditioning for Alternative Energy Technologies, executive summary
[SERI-TP-35-217-PT-2] N80-16505
Fossil energy program
[ORNL-5487] N80-16506
Direct energy conversion systems
[COO-2218-117] N80-16543
Advanced electric generation. Commercialization in phase 3 planning
[DOE/ERD-0014] N80-16547
Application analysis and photovoltaic system conceptural design for service/commercial/institutional and industrial sectors, task 1 report
[SAND-78-7032] N80-16550
Poleward heat flux and conversion of available potential energy in Drake passage
[PB-301311/7] N80-16712
Comments on TEC trends
[NASA-TM-79317] N80-16885
ENERGY CONVERSION EFFICIENCY
Survey of potential chlorine production processes --- for energy efficiency
[ANL/OEPM-79-1] N80-16131
Cost of energy evaluation N80-16482
Study of advanced radial outflow turbine for solar steam Rankine engines
[NASA-CR-159695] N80-16483
Outdoor test for thermal performance evaluation of the Owens-Illinois Sunpack SEC-601 (air) solar collector
[NASA-CR-161339] N80-16492
Performance characteristics of a commercially available point-focus solar power --- systems analysis of a solar energy conversion system in terms of power efficiency and energy conversion efficiency
[SERI/TP-34-169] N80-16529
Direct energy conversion systems
[COO-2218-117] N80-16543
ENERGY DISTRIBUTION
Energy dispersion and relaxation in propynal using laser IR/visible double resonance
[COO-4695-2] N80-16381
ENERGY LEVELS
Central collisions in intermediate energy heavy-ion reaction
[CONF-790743-5] N80-16854
ENERGY POLICY
Survey of potential chlorine production processes --- for energy efficiency
[ANL/OEPM-79-1] N80-16131
Polymer materials basic research needs for energy applications. Proceedings of a Workshop Recommending Future Directions in Energy-Related Polymer Research
[CONF-780643] N80-16172
Coal liquefaction
[DOE/ET-0068/3] N80-16183
Assessment of the technical and economic feasibility of converting wood residues to liquid and gaseous fuel products using state-of-the-art and advanced coal conversion technology

ENERGY TRANSFER

Development of percutaneous energy transmission systems
[PB-299739/3] N80-16731

Development of precutaneous energy transmission
[PB-300518/8] N80-16732

Picosecond dynamics of energy transfer in pure and mixed organic crystals N80-16901

ENGINE NOISE

Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159598] N80-16061

Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159749] N80-16062

ENGINE TESTS

Expanded study of feasibility of measuring in-flight 747/JT9D loads, performance, clearance, and thermal data
[NASA-CR-159717] N80-16063

ENGINEERING DRAWINGS

Mechanical tunnel boring prediction and machine design
[PB80-101660] N80-16239

ENVIRONMENT EFFECTS

Assessment of environmental and safety problems in hydrogen energy systems
[LA-UR-79-583] N80-16186

Environmental development plan: Solar thermal power systems
[DOE/EDP-0035] N80-16503

Federal photovoltaics utilization program
[DOE/EA-0087] N80-16525

Petroleum production at maximum efficient rate, Naval Petroleum Reserve no. 1 (Elk Hills), Kern County, California
[DOE/EIS-0012] N80-16581

Oxidant air pollution impact to the forests of eastern United States: A literature review
[PB80-103500] N80-16589

Environmental assessment of stationary source NOx control technologies
[PB-300469/4] N80-16601

Evaluation of the environmental effects of western surface coal mining. Volume 2: Mine inventory
[PB-301249/9] N80-16621

Environmental assessment of surface mining methods: Head-of-hollow fill and mountaintop removal
[PB-300540/2] N80-16622

An assessment of the effects of bathymetric changes associated with sand and gravel mining on tidal circulation in the lower bay of New York Harbor
[PB80-106487] N80-16703

Factors influencing specific growth rates and seasonal abundance of eutrophic lake phytoplankton N80-16716

Local and regional development and transportation needs
[PB-301207/7] N80-16970

ENVIRONMENT MANAGEMENT

Report on the progress of regulations to protect stratospheric ozone
[PB-301368/7] N80-16665

ENVIRONMENT MODELS

A simulation model of estuarine subsystem coupling and carbon exchange with the sea N80-16699

ENVIRONMENT POLLUTION

Adsorption of energy-related organic pollutants: A literature review
[PB80-105117] N80-16595

ENVIRONMENT PROTECTION

Environmental development plan: Underground coal gasification
[DOE/EDP-0047] N80-16411

The Environmental Protection Agency's role in the protection of wetlands: Examination of EPA's participation in the section 404 regulatory program N80-16574

Optimal treatment levels of a stream pollution abatement system under three environmental control policies. Part 2: Preliminary sensitivity analysis of a convex equivalent of the fixed dissolved oxygen requirement policy GP model using SENSUMT
[AD-A074216] N80-16579

Environmental system study on the development of fossil fuel resources in the Southwest
[PB-300526/1] N80-16596

Report on the progress of regulations to protect stratospheric ozone
[PB-301368/7] N80-16665

Information transfer in the Office of Research and Development — relating to environment protection studies
[PB80-101371] N80-16972

ENVIRONMENT SIMULATORS

The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 1: Principles of operation
[AD-A074542] N80-16044

The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 2: Appendices to the principles of operation
[AD-A074482] N80-16045

ENVIRONMENTAL MONITORING

Meteorological Effects of Thermal Energy Releases (METER) program
[ORNL/TM-6867] N80-16693

ENVIRONMENTAL QUALITY

Environmental impact and economic evaluation research needs for coastal and marine resource management
[PB-301208/5] N80-16604

The interaction between urbanization and land quality in environmental planning and design: The transportation model technical documentation
[PB-300981/8] N80-16967

The interaction between urbanization and land quality and quantity in environmental planning and design: The land value model technical documentation
[PB-301047/7] N80-16968

ENVIRONMENTAL SURVEYS

Petroleum production at maximum efficient rate, Naval Petroleum Reserve no. 1 (Elk Hills), Kern County, California
[DOE/EIS-0012] N80-16581

ENZYME ACTIVITY

Ultrafiltration of raw sewage using an immobilized enzyme membrane
[AD-A074804] N80-16951

EPOXY RESINS

Shelf-life determination of epoxy prepregs and film adhesives
[BDX-613-2110] N80-16922

EQUATIONS OF MOTION

Mass transfer controlled reactions in packed beds at low Reynolds numbers N80-16112

Some approximations in vibrations and wave motion of elastic media N80-16364

EROSION

Scanning-electron-microscope study of normal-impingement erosion of ductile metals
[NASA-TP-1609] N80-16141

ERROR CORRECTING CODES

On-line programmer's management system
[AD-A074468] N80-16774

Correcting the plotting symbol positioning error in Tektronix's GRAPH PLOT 50 software (4050A07 series B)
[UCID-18234] N80-16786

ESTERS

Perfluoroether triazine elastomers
[NASA-CR-162748] N80-16166

ESTIMATES

As-built design specification of software for cluster-based proportion estimation
[E80-10045] N80-16395

ESTIMATING

Estimation of random fields from network observations
[COO-2874-54] N80-16811

ESTUARIES

Evaluation of a digital model for estuarine water quality simulation in waste allocation studies — Florida Gulf Coast
[PB-298820/2] N80-16437

An analysis of the factors affecting the distribution of heavy metals in a tidal estuary N80-16573

A simulation model of estuarine subsystem coupling and carbon exchange with the sea N80-16699

The distribution and seasonality of the benthic aquatic macrophytes of the Pamlico River estuary, North Carolina
[PB-300496/7] N80-16710

ETCHING

Homogeneous alignment of nematic liquid crystals by ion beam etched surfaces
[NASA-TM-81378] N80-16232

ETHANE

Flash hydropyrolysis of coal
[BNL-51010] N80-16185

ETHYLENE

Experimental and theoretical investigation of ethylene oxidation in a fixed-bed reactor N80-16114

EULER EQUATIONS OF MOTION

Evaluation of Lagrangian, Eulerian, arbitary Lagrangian-Eulerian methods for fluid-structure interaction problems in HCDA analysis
[CONF-790802-55] N80-16295

Quasi-Eulerian formulation for fluid-structure interaction
[CONF-790802-66] N80-16306

EULER-LAGRANGE EQUATION

Evaluation of Lagrangian, Eulerian, arbitary Lagrangian-Eulerian methods for fluid-structure interaction problems in HCDA analysis
[CONF-790802-55] N80-16295

EUROPE

Homogeneous magnitude system of the Eurasian continent: P waves
[PB-301262/0] N80-16666

EUTROPHICATION

Phytoplankton water quality relationships in US lakes. Part 1: Methods, rationale and data limitations
[PB-298439/1] N80-16419

Phytoplankton water quality relationships in US lakes. Part 2: Genera Acanthosphaera through Cystodinium Collected from eastern and southeastern lakes
[PB-298440/9] N80-16420

Phytoplankton water quality relationships in US lakes. Part 3: Genera Dactylococcopsis through Gyrosigma collected from eastern and southeastern lakes
[PB-298441/7] N80-16421
Phytoplankton water quality relationships in US lakes. Part 4: Genera Hantzchia through Pteromonas collected from eastern and southeastern lakes
[PB-298442/5] N80-16422
Phytoplankton water quality relationships in US lakes. Part 5: Genera Quadrigula through Zygnema collected from eastern and southeastern lakes
[PB-298443/3] N80-16423
Factors influencing specific growth rates and seasonal abundance of eutrophic lake phytoplankton N80-16716

EVALUATION
Evaluation of the potential for reduced longitudinal spacing on final approach
[AD-A076434] N80-16049

EVAPORATION
Remote sensing for diagnosing vapor dispersion in spills of liquid energy fuels
[UCID-18237] N80-16409

EXCITONS
Theoretical studies of bound exciton decay and of transport across semiconductor interfaces N80-16904

EXHAUST EMISSION
Air pollution from aircraft
[NASA-CR-159712] N80-16060
Development of high temperature subtractive column and chromatographic analysis of hydrocarbons present in diesel exhaust
[BETC/RI-78/12] N80-16130
Impact of air quality control measures
[PB-301234/1] N80-16605
Development of an SO2 monitor for mobile sources
[PB80-100472] N80-16606

EXHAUST GASES
Infrared measurements of a scramjet exhaust --- to determine combustion efficiency
[NASA-CR-3242] N80-16058
Balancing the objectives of clean air and economic growth: Regulated markets in emission reductions
[PB-300835/6] N80-16598
Development of a monitor for HCN in mobile source emissions
[PB80-100514] N80-16607

EXOBIOLOGY
Aerospace Medicine and Biology: A continuing bibliography with indexes supplement 201
[NASA-SP-7011(201)] N80-16724

EXPERIMENTAL DESIGN
An experimental design for total container impact response modeling at extreme temperatures N80-16207
Circular balanced repeated measurements design
[AD-A074234] N80-16825

EXPLORER 43 SATELLITE
Technique to determine location of radio sources from measurements taken on spinning spacecraft
[NASA-TM-80598] N80-16260

EXPLOSIONS
Blast from bursting frangible pressure spheres N80-16208
Prediction of fragment velocities and trajectories N80-16210

EXPLOSIVE DEVICES
Terminal velocity and rotation rate of a flyer plate propelled by a tube-confined explosive charge N80-16229

EXPLOSIVES
Estimation of the density of organic explosives from their structural formulas
[LA-7790-MS] N80-16188
A computational model describing the initiation of silver acetylide-silver nitrate explosive by an intense light source N80-16228

EXPONENTIAL FUNCTIONS
EXPALS: FORTRAN code for exponential approximation by least squares
[UCRL-14541-REV-2] N80-16782

EXPOSURE
Research related to the expansion and improvement of human vibration exposure criteria N80-16217

EXTRAPOLATION
Development of a standard methodology for the correlation and extrapolation of elevated temperature creep and rupture data. Volume 2: A state-of-the-art review
[EPRI-FP-1062-VOL-2] N80-16152

EYE PROTECTION
Evaluation of commercially available laser protective eyewear
[PB80-103039] N80-16741

F

F REGION
Analysis of numerical ionograms. 3: The valley program
[IPS-X8] N80-16648

FABRICATION
Manufacturing processes for fabricating graphite/PMR 15 polyimide structural elements
[NASA-CR-159129] N80-16105

FABRICS
Evaluation of the effectiveness of fabric reinforcement in extending the in-service life of bituminous concrete overlays
[PB-301305/9] N80-16248

FACSIMILE COMMUNICATION
Facsimile techniques for on-line computer networks
[BLL-BLRDR-5506] N80-16789

FAILURE ANALYSIS
Carbon fiber electrical resistance modification, its relationship to electrical equipment malfunction
[AD-A074656] N80-16278

FAILURE MODES
Fracture modes of high modulus graphite/epoxy angleplied laminates subjected to off-axis tensile loads
[NASA-TM-81405] N80-16102
Probability of failure prediction for step-stress fatigue under sine or random stress N80-16200

FANS (LANDFORMS)
The Yallahs fan delta, southeastern Jamaica: A depositional model for active tectonic coastlines N80-16632

FAR INFRARED RADIATION
A twin optically-pumped far-infrared CH3OH laser for plasma diagnostics --- Tokamak devices
[IPPJ-428] N80-16882

FAR ULTRAVIOLET RADIATION
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 1: Estimate of the electron velocity distribution functions
[NASA-CR-162696] N80-16851

FARADAY EFFECT
Faraday rotation measurement method and apparatus --- to receive RF signals from spacecraft which exhibits polarization characteristics due to spin stabilization
[NASA-CASE-NPO-14839-1] N80-16313

FARMLANDS
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394
Soil fertility and soil loss constraints on crop residue removal for energy production
[SERI/RR-52-324] N80-16511

FAST FOURIER TRANSFORMATIONS
Computation of Hankel transforms using the fast-Fourier transform algorithms
[PB80-104045] N80-16812

FASTENERS
Fastener hole quality, volume 2
[AD-A074730] N80-16378

FATIGUE LIFE
Probability of failure prediction for step-stress fatigue under sine or random stress N80-16200
M-50 steel bearing material factors for rolling element life calculations
[AD-A074217] N80-16345
Consistent creep and rupture properties for creep-fatigue evaluation --- stainless steels
[CONF-781202-21] N80-16387

FATIGUE TESTS
Biaxial creep-fatigue behavior of type 316h stainless steel tubi
[ANL-79-33] N80-16146
Long-life fatigue test results for two nickel-base structural alloys
[KAPL-4105] N80-16150
Analysis of wear-debris from full-scale bearing fatigue tests using the ferrograph
[NASA-TM-81403] N80-16341

FEASIBILITY ANALYSIS
Feasibility study of geothermal energy for heating greenhouses
[PB-299517/3] N80-16569

FEDERAL BUDGETS
Department of Housing and Urban Development, and certain independent agencies appropriations for fiscal year 1980, part 1
[GPO-41-318] N80-16949

FEEDBACK CONTROL
Active optimal control for suppression of whirl of a flexible centrifuge N80-16336

FERRITES
Localized corrosion and stress corrosion cracking behavior of austenitic stainless steel weldments containing retained ferrite
[COO-2462-5] N80-16149
Application of a diffusion model to oxide sintering
[PB-300399/3] N80-16238

FERROELECTRICITY
Dielectric and pyroelectric properties of ferroelectrics N80-16275

FIBER COMPOSITES
Novel approaches for alleviation of electrical hazards of graphite-fiber composites --- aircraft safety
[NASA-CR-162683] N80-16100
Prediction of fiber composite mechanical behavior made simple --- using a rocket calculator
[NASA-TM-81404] N80-16107

FIELD STRENGTH
A statistical analysis for digital field strength data
[BBC-RD-1979/24] N80-16276

FIELD THEORY (PHYSICS)
Statistical mechanics and field theory N80-16924

FILTRATION
Ultrafiltration of raw sewage using an immobilized enzyme membrane
[AD-A074804] N80-16951

FINITE ELEMENT METHOD
An evaluation of the ADINA finite element program for application to aircraft overpressure vulnerability
[AD-A074261] N80-16056
Variable modulus model for inelastic finite element analysis N80-16196
Homogeneous vortex model for liquid slosh in spinning spherical tanks
[NASA-CR-162725] N80-16299
Application of the finite element method to the nonlinear inverse heat conduction problem using Beck's second method
[K/CSD/INF-78/20] N80-16308
A penalty plate-bending element for the analysis of laminated anisotropic composite plates
[AD-A074236] N80-16375
Finite-element analysis of laminated biomodulus composite-material plates
[AD-A074184] N80-16376

FIRE DAMAGE
A study of indirect fire losses from fires in non-residential properties. Volume 1: Research report
[PB-299126/3] N80-16241
A study of indirect fire losses from fires in non-residential properties. Volume 3: Indirect residential fire loss - a case study
[PB-299127/1] N80-16242

FIRES
Radiant heating of mine bulkheads
[PB-300363/9] N80-16444

FISHES
Ichthyoplankton abundance and diversity in the eastern Gulf of Mexico
[PB-299839/1] N80-16624

FITTING
Assembly of interference fits by impact and constant force methods
[PB-301289/5] N80-16351

FIXED POINT ARITHMETIC
Qualitative study of nonlinear problems in analysis
[AD-A074017] N80-16807

FIXED POINTS (MATHEMATICS)
Smooth group actions of prime order and fixed point sets N80-16791

FLAME PROPAGATION
Theoretical study of a reaction-diffusion model for flame propagation in a gas
[LBL-9487] N80-16128

FLAME RETARDANTS
Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides --- flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116
Crystalline polyimides --- reinforcing fibers for high temperature composites and adhesives as well as flame retardation
[NASA-CASE-LAR-12099-1] N80-16158

FLAT PLATES
Flat plate solar collector design and performance. Citations from the NTIS data base
[NTIS/PS-79/0928/6] N80-16566
Flat plate solar collector design and performance. Citations from the Engineering Index data base
[NTIS/PS-79/0929/4] N80-16567

FLEXIBILITY
Lateral and tilt whirl modes of flexibly mounted flywheel systems N80-16215
Evaluation of experimental flexible pavements
[PB-310251/5] N80-16246

FLEXIBLE BODIES
Research study: Space vehicle control systems
[NASA-CR-161368] N80-16092
Strong thin membrane structure --- solar sails
[NASA-CASE-NPO-14021-2] N80-16163
Snaps in structures --- encountered in a solar array for a spacecraft N80-16204

FLEXIBLE WINGS
Parameter identification of flexible flight vehicles assuming a low-reduced-frequency aerodynamic representation N80-16054

FLIGHT CHARACTERISTICS
Application of random time domain analysis to dynamic flight measurements --- B-1 aircraft N80-16226

FLIGHT CONTROL
Maximum likelihood identification of aircraft parameters with unsteady aerodynamic modelling N80-16027
Digital adaptive controllers for VTOL vehicles. Volume 1: Concept evaluation
[NASA-CR-159154-VOL-1] N80-16065

FLIGHT LOAD RECORDERS
Expanded study of feasibility of measuring in-flight 747/JT9D loads, performance, clearance, and thermal data
[NASA-CR-159717] N80-16063

FLIGHT PATHS
Experimental evaluation of active and passive means of alleviating rotor impulsive noise in descent flight
[NASA-CR-159188] N80-16839

FLIGHT SIMULATORS
Feasibility and concept study to convert the NASA/AMES vertical motion simulator to a helicopter simulator
[NASA-CR-152193] N80-16070
Computer image generation texture study --- to enhance visual flight simulators
[AD-A074019] N80-16770

FLIGHT TESTS
NASA quiet short-haul research aircraft experimenters' handbook
[NASA-TM-81162] N80-16024
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-701) 2: Extrapolation of wind-tunnel data to full-scale conditions
[NASA-TP-1515] N80-16032
Instrumentation modeling technique used in the identification of aerodynamic coefficients from flight test data
[SAND-78-0721C] N80-16038
Results of a Loran-C flight test using an absolute data reference
[NASA-CR-162751] N80-16051

FLOOD PLAINS
A technique for estimating heights reached by the 100-year flood on unregulated, nontidal streams in North Carolina
[PB-301372/9] N80-16446
Quaternary stream terraces in the northwestern Sacramento Valley, Glenn, Tehama, and Shasta Counties, California N80-16631

FLOOD PREDICTIONS
A technique for estimating heights reached by the 100-year flood on unregulated, nontidal streams in North Carolina
[PB-301372/9] N80-16446

FLOODS
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438

FLORIDA
Evaluation of a digital model for estuarine water quality simulation in waste allocation studies --- Florida Gulf Coast
[PB-298820/2] N80-16437
Saltwater-barrier line in Florida: Concepts, considerations, and site examples
[PB80-101306] N80-16591
Observations of temperature, current, and wind variations off the central eastern coast of Florida during 1970 and 1971
[PB-301280/4] N80-16709

FLOW CHARACTERISTICS
Flow routing in the Susquehanna River basin. Part 2: Low-flow frequency characteristics of the Susquehanna River between Waverly, New York and Sunbury, Pennsylvania
[PB-301392/7] N80-16414

FLOW CHARTS
Data flow computing: Software development
[UCRL-83026] N80-16783

FLOW DISTRIBUTION
The aerodynamics of tracked ram air cushion vehicles - effects of pitch attitude and upper surface flow
[PB80-101827] N80-16041
Stability analysis of interfacial circulation on a static liquid drop with forced internal circulation N80-16290
Scaling of some flowfields with flames --- internal combustion engines
[CONF-7811102-2] N80-16305

FLOW MEASUREMENT
Hot film anemometry. A bibliography with abstracts
[NTIS/PS-79/0909/6] N80-16318
Nonorthogonal measurement axes in laser Doppler velocimetry
[AD-A073700] N80-16323

FLOW STABILITY
A general method to determine the stability of compressible flows N80-16028

FLUID DYNAMICS
Hot wire anemometry, volume 2. A bibliography with abstracts
[NTIS/PS-79/0957/5] N80-16319

FLUID MECHANICS
Quasi-Eulerian formulation for fluid-structure interaction
[CONF-790802-66] N80-16306

FLUIDIZED BED PROCESSORS
Advanced electric generation. Commercialization in phase 3 planning
[DOE/ERD-0014] N80-16547

FLUORINE ORGANIC COMPOUNDS
Phosphonitrilic fluoroelastomer coated fabrics for collapsible fuel storage tanks
[AD-A074824] N80-16167

FLUORO COMPOUNDS
Perfluoroether triazine elastomers
[NASA-CR-162748] N80-16166

FLUTTER ANALYSIS
Research on the flutter of axial turbomachine blading
[AD-A074597] N80-16064

FLUX DENSITY
Modeling the beam characterization system
[SAND-79-1295C] N80-16530
Interior Heissner-Nordstrom black holes N80-16978

FLYWHEELS
Lateral and tilt whirl modes of flexibly mounted flywheel systems N80-16215
Flywheel energy storage and conversion system for photovoltaic applications
[COO-4094-57] N80-16501
Spin test of the University of California, Lawrence Livermore Laboratory composite flywheel at the Applied Physics laboratory, The Johns Hopkins University, on 18 July 1978
[UCRL-13910] N80-16544
Aerodynamic heating of high-speed flywheels in low-density environments
[SAND-78-0957] N80-16548

FOAMS
Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides --- flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116

FOLDING STRUCTURES
Study of foldable elastic tubes for large space structure applications, phase 1
[NASA-CR-162652] N80-16083

FORCE DISTRIBUTION
Wing flapping with minimum energy --- minimize the drag for a bending moment at the wing root
[NASA-TM-81174] N80-16035

FORECASTING
Low-level radioactive waste management. Volume 2: Forecast of low-level radwaste management requirements
[PB80-105059] N80-16873

FORESTS
Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types --- San Juan Mountains, Colorado
[E80-10041] N80-16391
Computer-aided processing of LANDSAT MSS data for classification of forestlands --- San Juan Mountains, Colorado
[E80-10043] N80-16393
Oxidant air pollution impact to the forests of eastern United States: A literature review
[PB80-103500] N80-16589

FORMALISM
Formalizing the analysis of algorithms N80-16758

FORTRAN
FORTRAN subroutines for bicubic spline interpolation
[ORNL/CSD/TM-67] N80-16777
PIE: A FORTRAN subroutine for plotting circles, concentric circles, pie charts, and shaded pie charts
[ORNL/CSD/TM-82] N80-16781
Comparison of nonlinear least squares software
[SAND-79-0483] N80-16784

FORWARD SCATTERING
The internal refractive index spectra of clouds from forward scatter radar observations
[PB80-107238] N80-16660

FOSSIL FUELS
Fossil energy program
[ORNL-5487] N80-16506
Adsorption of energy-related organic pollutants: A literature review
[PB80-105117] N80-16595
Environmental system study on the development of fossil fuel resources in the Southwest
[PB-300526/1] N80-16596

FOUNDATIONS
Effect of subbase type and subsurface drainage on behavior of CRC pavements
[PB80-101165] N80-16240
Steady state response of a circular foundation on a transversely isotopic medium N80-16369

FRACTURE MECHANICS
Fracture modes of high modulus graphite/epoxy angleplied laminates subjected to off-axis tensile loads
[NASA-TM-81405] N80-16102
Dislocation model for twinning and fracture and its application to HCP metals
[CONF-790801-3] N80-16148
Probability of failure prediction for step-stress fatigue under sine or random stress N80-16200
A differential geometric approach to material deformation N80-16365
Investigation of seismic sources by the linear inversion of seismograms --- fracture mechanics N80-16637

FRACTURE STRENGTH
Increased fracture toughness of graphite-epoxy composites through intermittent interlaminar bonding --- Mylar interlayer
[NASA-CR-159198] N80-16106
Prediction of fiber composite mechanical behavior made simple --- using a rocket calculator
[NASA-TM-81404] N80-16107
Effect of heat treatment on the elevated temperature tensile and fracture toughness response of Alloy 718
[HEDL-TME-78-98] N80-16151

FRAMES
Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions
[PB-301091/5] N80-16252
Investigation of the nonlinear characteristics of a three story steel frame using system
[PB-301363/8] N80-16253
FREE CONVECTION
Numerical solution of three-dimensional natural convection by the strongly implicit procedure
[DP-MS-78-14] N80-16310
FREE ENERGY
Catalog of two-dimensional vortex patterns --- free energy minima
[LA-7384-MS] N80-16309
FREE JETS
An experimental study of multiple jet mixing
N80-16292
FREE RADICALS
Nature of oxygen containing radicals in radiation chemistry and photochemistry of aqueous solutions
[COO-3221-60] N80-16122
FREE VIBRATION
The free vibration equations, natural frequencies and modal characteristics of closed circular cylindrical shells
[NAL-TR-569T] N80-16373
FREQUENCY ASSIGNMENT
Probability of intermodulation interference in an expanded CB service
[PB-300296/1] N80-16267
FREQUENCY SHIFT
Laser Doppler velocity simulator --- to induce frequency shift
[NASA-CASE-LAR-12176-1] N80-16321
FRICTION
Losses caused by friction in straight pipes with systematic roughness elements
[ESDU-79014] N80-16288
Program to develop sprayed, plastically deformable compressor shroud seal materials
[NASA-CR-159741] N80-16338
Tribological properties of silicon carbide in metal removal process
[NASA-TM-79238] N80-16340
FUEL CELLS
An ac/dc power converter for batteries and fuel cells
[EPRI-EM-662] N80-16284
Advanced electric generation. Commercialization in phase 3 planning
[DOE/ERD-0014] N80-16547
Comparative assessment of residential energy supply systems that use fuel cells: Executive summary --- domestic energy supply systems analysis of coal fired power plants using fuel cells
[PB-299207/1] N80-16564
Comparative assessment of residential energy supply systems that use fuel cells
[PB-299208/9] N80-16565
FUEL COMBUSTION
Air pollution from aircraft
[NASA-CR-159712] N80-16060
Engine combustion technology overview
[SAND-78-8801] N80-16347
FUEL CONSUMPTION
A study of aerodynamic methods for improving truck fuel economy
[PB80-101272] N80-16040
Worldwide transportation/energy demand forecast, 1975 - 2000
[ORNL/SUB-78/13536/1] N80-16546
Contributions to the foundations of supply for energy and transportation: Concepts, economics, and technologies
[PB-300541/0] N80-16554
FUEL SPRAYS
Combustion of multicomponent fuel droplets
[COO-4449-2] N80-16126
FUEL TANKS
Phosphonitrilic fluoroelastomer coated fabrics for collapsible fuel storage tanks
[AD-A074824] N80-16167
Test evaluation of shock buffering concept for hydrodynamic ram induced by yawing projectile impacting a simulated integral fuel tank N80-16209
FUELS
Preliminary assessment of the prospects for use of refuse-derived fuel in Maryland
[BNL-51065] N80-16179
Alcohol fuels. Citations from the American petroleum institute data base --- a bibliography with abstracts
[NTIS/PS-79/0911/2] N80-16195
FUNCTIONS (MATHEMATICS)
A general approach to ordering of parameters with application in reliability
[AD-A074246] N80-16357
FUSION
Hydrogen pellet fueling experiment on the ISX-A Tokamak
[ORNL/TM-6496] N80-16892
FUSION REACTORS
Confirmatory analysis and detail design of the magnet system for Mirror Fusion Test Facility (MFTF)
[UCRL-13923] N80-16893
Systems-design and energy-balance considerations for impact fusion
[LA-UR-79-1969] N80-16899

G

GADOLINIUM
Magnetic critical temperature gap in Gd-Y alloys
[ISM-228] N80-16916
GALACTIC NUCLEI
Kinematics of H1 near the galactic center
N80-16993
GALACTIC RADIO WAVES
A radio survey of bright galaxies N80-16984
GALACTIC ROTATION
Kinematics of H1 near the galactic center
N80-16993
GALACTIC STRUCTURE
H 2 region-like galaxies --- analysis of hydrogen line spectra in galaxies N80-16995
GALAXIES
H 2 region-like galaxies --- analysis of hydrogen line spectra in galaxies N80-16995
GALILEAN SATELLITES
Voyager 1: Encounter with Jupiter
[NASA-CR-162721] N80-17003
GALLIUM ARSENIDES
Diffusion length measurements of thin GaAs solar cells by means of energetic electrons
[NASA-CR-162692] N80-16489
Comparative low energy electron diffraction studies of InSb(110) and GaAs(110) surfaces N80-16911
GAMMA RAY ASTRONOMY
Characteristics of the telescope for high energy gamma-ray astronomy selected for definition studies on the gamma ray observatory
[NASA-TM-80590] N80-16987
GAMMA RAY TELESCOPES
Characteristics of the telescope for high energy gamma-ray astronomy selected for definition studies on the gamma ray observatory
[NASA-TM-80590] N80-16987
GAMMA RAYS
Compton scatter in germanium and its effect of imaging with gamma-ray position-sensitive detectors
[CONF-781028-1] N80-16923
The unique cosmic event of 1979 March 5
[NASA-TM-80630] N80-17012
GAS CHROMATOGRAPHY
Development of high temperature subtractive column and chromatographic analysis of hydrocarbons present in diesel exhaust
[BETC/RI-78/12] N80-16130
Study of hydrocarbon-shale interaction
[ORO-5197-14] N80-16409
GAS COOLING
Step-by-step approach to convective cooling of laser disc amplifiers
[UCRL-15047] N80-16327
GAS DETECTORS
Development of a monitor for HCN in mobile source emissions
[PB80-100514] N80-16607
GAS DISSOCIATION
Potential performance improvement using a reacting gas (nitrogin tetroxide) as the working fluid in a closed Brayton cycle
[NASA-TM-79322] N80-16490
GAS DYNAMICS
Carbon dioxide lasers, volume 3: A bibliography with abstracts
[NTIS/PS-79/1067/2] N80-16334
GAS EVOLUTION
Environmental particulates: Characterization by helium plasma and elucidation of formation processes N80-16110
GAS FLOW
Some considerations of the performance of two honeycomb gas path seal material systems
[NASA-TM-81398] N80-16143
Turbulent dusty gas motions with weak statistical coupling
[UCRL-82131] N80-16307
Program to develop sprayed, plastically deformable compressor shroud seal materials
[NASA-CR-159741] N80-16338
GAS MASERS
A study of hydroxyl masers in the circumstellar envelopes of long period variable stars N80-16985
GAS RECOVERY
Unconventional gas recovery program
[METC/SP-79/8] N80-16181
GAS TEMPERATURE
Space shuttle base heating analysis
[NASA-CR-161375] N80-16089
Evaluation of stationary source particulate measurement methods. Volume 3: Gas temperature control during method 5 sampling
[PB-300336/5] N80-16616
GAS TURBINE ENGINES
Air pollution from aircraft
[NASA-CR-159712] N80-16060
Some considerations of the performance of two honeycomb gas path seal material systems
[NASA-TM-81398] N80-16143
GAS TURBINES
Potential performance improvement using a reacting gas (nitrogin tetroxide) as the working fluid in a closed Brayton cycle
[NASA-TM-79322] N80-16490
GAS WELDING
Inert gas welding. Citations from the NTIS data base --- a bibliography with abstracts
[NTIS/PS-79/0995/5] N80-16353
Inert gas welding, volume 3: Citations from the Engineering Index data base --- a bibliography with abstracts
[NTIS/PS-79/0996/3] N80-16354
GAS-METAL INTERACTIONS
Titanium combustion in turbine engines
[AD-A075657] N80-16059
GAS-SOLID INTERACTIONS
Hydrogen diffusion, dissolution and permeation of nonmetallic solids
[ORO-4721-T1] N80-16124
GASEOUS DIFFUSION
Hydrogen diffusion, dissolution and permeation of nonmetallic solids
[ORO-4721-T1] N80-16124
Theoretical study of a reaction-diffusion model for flame propagation in a gas
[LBL-9487] N80-16128
An optical investigation of the correlation between mass transport and mechanical properties of strained polymer films N80-16161
GASOHOL (FUEL)
Gasohol: A technical memorandum
[PB80-105885] N80-16194
GASOLINE
Conceptual design of a coal-to-methanol-to-gasoline commercial plant: Executive summary
[FE-2416-43] N80-16182
Development studies on selected conversion of synthesis gas from coal to high octane gasoline
[FE-2276-27] N80-16190
GASTROINTESTINAL SYSTEM
Effects of ingestion of cold and hot water on the course of thermal changes in the stomach and intestine
[NASA-TM-75515] N80-16728
GEARS
Thermal elastohydrodynamic lubrication of spur gears
[NASA-CR-3241] N80-16337
GENERAL AVIATION AIRCRAFT
Transponder Performance Analyzer (TPA)
[AD-A075783] N80-16048

GEODETIC COORDINATES
HOACOS: A program for adjusting horizontal networks in three dimensions
[PB-301351/3] N80-16432
GEOLOGICAL FAULTS
Vertical movement along the Cerro Prieto transform fault, Baja California, Mexico - a mechanism for geothermal energy renewal
[LBL-8905] N80-16652
GEOLOGICAL SURVEYS
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Yellowstone National Park
[PB-301333/1] N80-16429
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Rocky Mountain National Park
[PB-301334/9] N80-16430
Stratigraphy and sedimentology of the Upper Devonian Catskill and Uppermost Trimmers Rock formations in central Pennsylvania N80-16629
South Atlantic outer continental shelf geological studies, FY 1976
[PB-300822/4] N80-16701
South Atlantic outer continental shelf geological studies, FY 1976 — sediment transport over the south Atlantic ocean bottom
[PB-300820/8] N80-16702
GEOLOGY
Geology of precambrian metamorphic rocks of the Truchas Peaks area, north-central New Mexico
N80-16626
Preliminary geologic appraisal and economic aspects of the Precambrian basement of Iowa
N80-16633
GEOMAGNETISM
Magnetic results from Nurmijaervi geophysical observatory, 1978
[ISBN-951-697-125-3] N80-16645
GEOPHYSICAL OBSERVATORIES
Magnetic results from Nurmijaervi geophysical observatory, 1978
[ISBN-951-697-125-3] N80-16645
GEOPHYSICS
Geophysics of the Geysers geothermal field northern California N80-16639
GEOS 3 SATELLITE
The role of satellite altimetry in climate studies
[NASA-TP-1570] N80-16676
GEOSTROPHIC WIND
Dynamics of equatorial mass-flow adjustment
N80-16671
GEOSYNCHRONOUS ORBITS
Computed voltage distributions around solar electric propulsion spacecraft
[NASA-TM-79286] N80-16094
GEOTHERMAL ENERGY CONVERSION
Economics of geothermal power
[COO-4051-43] N80-16497
Decentralized energy: Technology assessment and systems description
[BNL-50987] N80-16502
Hydrothermal electric and direct heat. Commercialization phase 3 planning
[DOE/ERD-0005] N80-16545
Feasibility study of geothermal energy for heating greenhouses
[PB-299517/3] N80-16569
GEOTHERMAL RESOURCES
Apparatus and techniques for the study of precipitation of solids and silica from hypersaline geothermal brine
[UCRL-52799] N80-16127
Hydrothermal electric and direct heat. Commercialization phase 3 planning
[DOE/ERD-0005] N80-16545
Vertical movement along the Cerro Prieto transform fault, Baja California, Mexico - a mechanism for geothermal energy renewal
[LBL-8905] N80-16652
GERMANIUM
Surface self-diffusion of germanium and silicon
[UCRL-82865] N80-16921
Compton scatter in germanium and its effect of imaging with gamma-ray position-sensitive detectors
[CONF-781028-1] N80-16923
GEYSERS
Geophysics of the Geysers geothermal field northern California N80-16639
GLACIAL DRIFT
Determination of hydrologic parameters for glacial tills in Connecticut
[PB-300313/4] N80-16433
GLASS
Refractory particles in cullet recovered from municipal refuse
[PB-300523/8] N80-16597
Phonon scattering in metallic glasses
[BNL-26610] N80-16917
GLIDE PATHS
Dipole broadside glide slope array — for landing systems
[AD-A077042] N80-16047
GLUCOSE
Glucose metabolism in different regions of the rat brain under hypokinetic stress influence
[NASA-TM-75949] N80-16718
GOES SATELLITES
Geostationary operational environmental satellite/data collection system
[PB-301276/2] N80-16087
GOLD
Radiation from Ag and K film bombarded by low energy electrons
[ORNL/TM-6527] N80-16859
GOVERNMENTS
NCSL remote sensing project — State Legislature considerations and activities
[E80-10053] N80-16401
Linking science and technology to public policy: The role of universities
[PB80-108202] N80-16934
GRAIN BOUNDARIES
Sintering kinetics of pure and doped boron carbide
[UCRL-82515] N80-16108
GRAINS (FOOD)
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400
GRAPH THEORY
Network flows, volume 2. A bibliography with abstracts
[NTIS/PS-79/1078/9] N80-16826
GRAPHITE
Manufacturing processes for fabricating graphite/PMR 15 polyimide structural elements
[NASA-CR-159129] N80-16105
GRAPHITE-EPOXY COMPOSITE MATERIALS
Novel approaches for alleviation of electrical hazards of graphite-fiber composites — aircraft safety
[NASA-CR-162683] N80-16100
Fracture modes of high modulus graphite/epoxy angleplied laminates subjected to off-axis tensile loads
[NASA-TM-81405] N80-16102
Increased fracture toughness of graphite-epoxy composites through intermittent interlaminar bonding — Mylar interlayer
[NASA-CR-159198] N80-16106
Manufacturing methods of a composite cell case for a Ni-Cd battery
[NASA-CR-162724] N80-16488
GRAPHS (CHARTS)
HOACOS: A program for adjusting horizontal networks in three dimensions
[PB-301351/3] N80-16432
GRAVITATIONAL EFFECTS
Effect of gravitation stress and hypokinesia on blood vessels of the testicle
[NASA-TM-75942] N80-16726
GRAVITATIONAL FIELDS
Metric-connection theories of gravity — particle spin N80-16643
GREAT BRITAIN
Some statistical indicators of UK abstracting and indexing services

Information systems in UK agriculture
[BLL-BLRDR-5469] N80-16948
GREAT SALT LAKE (UT)
A mathematical model of stratified, bidirectional flow in short culverts
[PB-300494/2] N80-16434
A mathematical hydrodynamic circulation model of Great Salt Lake for resource management
[PB-299013/3] N80-16436
GRINDING
Tribological properties of silicon carbide in metal removal process
[NASA-TM-79238] N80-16340
GROUND BASED CONTROL
Space vehicle approach procedures described
N80-16077
GROUND EFFECT
Investigation of ground effects on large and small scale models of a three fan V/STOL aircraft configuration
[NASA-CR-152240] N80-16030
GROUND EFFECT (AERODYNAMICS)
The aerodynamics of tracked ram air cushion vehicles - effects of pitch attitude and upper surface flow
[PB80-101827] N80-16041
GROUND EFFECT (COMMUNICATIONS)
Propagation of sound through the atmosphere: Effects of ground cover 2
[AD-A073262] N80-16840
GROUND EFFECT MACHINES
The aerodynamics of tracked ram air cushion vehicles - effects of pitch attitude and upper surface flow
[PB80-101827] N80-16041
JEFF(A) mixed-flow model fan performance optimization
[AD-A074571] N80-16234
GROUND STATIONS
Input data for solar systems
[DOE/TIC-10193-REV-1] N80-16504
GROUND WATER
Occurrence availability and chemical quality of ground water in the Edwards Plateau region of Texas
[PB-299790/6] N80-16428
Aquifer modeling by numerical methods applied to an Arizona groundwater basin
[PB-298962/2] N80-16439
Groundwater quality monitoring of western oil shale development. Identification and priority ranking of potential pollution sources — in eastern Utah
[PB-300536/0] N80-16623
GROUND-AIR-GROUND COMMUNICATIONS
Telemetry from orbit N80-16078
FAA lightning protection study: Report of investigations relative to providing lightning protection for the Remote Center Air-to-Ground (RCAG)
[AD-A076943] N80-16259
GROWTH
Collection and analysis of vegetative cover data — Hanford Site, Washington
[PNL-3068] N80-16412
GULF OF MEXICO
Radiative transfer modeling applied to sea water constituent determination — Gulf of Mexico
[NASA-TM-72736] N80-16406
Evaluation of a digital model for estuarine water quality simulation in waste allocation studies — Florida Gulf Coast
[PB-298820/2] N80-16437
Ichthyoplankton abundance and diversity in the eastern Gulf of Mexico
[PB-299839/1] N80-16624
GUST LOADS
Average gust frequencies subsonic transport aircraft
[ESDU-69023-A-B-C] N80-16029
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16677
GYROFREQUENCY
Axis encircling ion gyro-radius
[SAI-79-023-766-LJ] N80-16895

H

H LINES
Kinematics of H1 near the galactic center
N80-16993
HANKEL FUNCTIONS
Computation of Hankel transforms using the fast-Fourier transform algorithms
[PB80-104045] N80-16812

HARDENING (MATERIALS)
Deformation hardening of type 304 stainless steel at elevated temperature
[CONF-790801-4] N80-16147

HARMONIC MOTION
On harmonic motion of sandwich plates
[AD-A074837] N80-16168

HARMONICS
The enhanced nodal equilibrium ocean tide and polar motion
[NASA-TM-80592] N80-16700
Approximation methods for the partition functions of anharmonic systems
[COO-3127-30-T1] N80-16857

HAZARDS
Novel approaches for alleviation of electrical hazards of graphite-fiber composites --- aircraft safety
[NASA-CR-162683] N80-16100

HAZE
HAOS quality assurance: Non-criteria pollutants, volume 2
[PB-299640/3] N80-16584

HEALTH PHYSICS
Federal photovoltaics utilization program
[DOE/EA-0087] N80-16525
Influence of x irradiation and diet on pituitary/thyroid function in the rat
[UR-3490-1674] N80-16722
Biological effects of high-voltage electric fields. Volume 1: An update
[EPRI-EA-1123] N80-16730
Evaluation of commercially available laser protective eyewear
[PB80-103039] N80-16741

HEART FUNCTION
Catecholamines and myocardial contractile function during hypodynamia and with an altered thyroid hormone balance
[NASA-TM-76000] N80-16720

HEART IMPLANTATION
Implanted energy conversion system
[PB80-101116] N80-16733

HEAT CAPACITY MAPPING MISSION
Investigation of the application of HCMM thermal data to snow hydrology --- Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397
Geologic application of thermal-inertia mapping from satellite --- Powder River Basin, Wyoming and Cabeza Prieta, Arizona
[E80-10050] N80-16398

HEAT EXCHANGERS
Producing slush oxygen with an auger and measuring the storage characteristics of slush hydrogen
[NASA-CR-158412] N80-16256
The effect of superheating on the performance of floating droplet direct contact heat exchangers
N80-16295
Step-by step approach to convective cooling of laser disc amplifiers
[UCRL-15047] N80-16327

HEAT FLUX
Poleward heat flux and conversion of available potential energy in Drake passage
[PB-301311/7] N80-16712

HEAT PUMPS
Computer simulation of ground coupled storage in a series solar assisted heat pump system
[BNL-26216] N80-16507
Experimental results from the solar ground coupling research facility at Brookhaven National Laboratory --- heat transfer and storage devices for a solar source heat pump system
[BNL-26219] N80-16509
Performance evaluation of a low-first-cost, three-ton, air-to-air heat pump in the heating mode --- performance tests to analyze heat pumps and their corresponding systems
[ORNL/CON-18] N80-16551

HEAT RESISTANT ALLOYS
Effect of heat treatment on the elevated temperature tensile and fracture toughness response of Alloy 718
[HEDL-TME-78-98] N80-16151
Influence of heat treatment on the microstructure and mechanical properties of Alloy 718 base metal and weldments
[HEDL-TME-78-54] N80-16156

HEAT STORAGE
Computer simulation of ground coupled storage in a series solar assisted heat pump system
[BNL-26216] N80-16507

HEAT TOLERANCE
A study of occupational heat stress by analysis of environmental and human factors N80-16735

HEAT TRANSFER
Natural convection in a vertical channel with heat and mass transfer and flow reversal N80-16291
Vapor locking and heat transfer under transient and steady state conditions --- to study thermal stability of super conducting magnets
[CONF-790815-19] N80-16303
Characterization of crushed glass as a transpired air heating solar collector material
[LA-UR-79-1336] N80-16498
Experimental results from the solar ground coupling research facility at Brookhaven National Laboratory --- heat transfer and storage devices for a solar source heat pump system
[BNL-26219] N80-16509

HEAT TREATMENT
Effect of heat treatment on the elevated temperature tensile and fracture toughness response of Alloy 718
[HEDL-TME-78-98] N80-16151
Influence of heat treatment on the microstructure and mechanical properties of Alloy 718 base metal and weldments
[HEDL-TME-78-54] N80-16156

HEAVY IONS
Central collisions in intermediate energy heavy-ion reaction
[CONF-790743-5] N80-16854
Coherence effects in heavy ion-atom collisions
[CONF-780936-1] N80-16860
Theory of heavy ion collisions
[COO-3463-51] N80-16862

HELICOPTERS
Feasibility and concept study to convert the NASA/AMES vertical motion simulator to a helicopter simulator
[NASA-CR-152193] N80-16070

HELIOSTATS
Modeling the beam characterization system
[SAND-79-1295C] N80-16530
Heliostat beam characterization system-calibration technique --- the design analysis and calibration techniques of heliostats using video equipment
[SAND-79-1532C] N80-16531
Heliostat system design and operation. Citations from the Engineering Index data base
[NTIS/PS-79/0930/2] N80-16571

HELIUM
Helium resources of the United States, 1977
[PB80-101744] N80-16426
Helium runaways in white dwarfs
[NASA-CR-162694] N80-16986

HELIUM PLASMA
Environmental particulates: Characterization by helium plasma and elucidation of formation processes N80-16110

HEPARINS
The significance of ACTH for the process of formation of complex heparin compounds in the blood during immobilization stress
[NASA-TM-75946] N80-16727

HETERODYNING
Heterodyne spatial interferometry of circumstellar dust shells at a wavelength of 11 microns
N80-16992

HETEROJUNCTION DEVICES
Amorphous silicon thin film heterojunction solar cells
[SAN-1846-T3] N80-16496
Carrier transport through heterojunction solar cells
[DOE/ET/23103-5] N80-16534

HEURISTIC METHODS
Heuristic decision rules for water resources planning
[PB-300578/2] N80-16435

HF LASERS
Evaluation of the effect of prepulses on HF laser-target interactions
[SAND-79-0353] N80-16329
Fusion laser studies
[NVO-1559-1] N80-16897

HIGH ALTITUDE
A survey of airborne radar systems for deployment on a High Altitude Powered Platform (HAPP)
[NASA-CR-156860] N80-16264

HIGH ENERGY INTERACTIONS
Theoretical high energy physics --- bibliography
[COO-2271-102] N80-16865
Research program in theoretical high-energy physics
[COO-3130TA] N80-16869
Characteristics of the telescope for high energy gamma-ray astronomy selected for definition studies on the gamma ray observatory
[NASA-TM-80590] N80-16987

HIGH FREQUENCIES
Superconducting notch filter --- for application to the HF communication band
[CONF-790815-23] N80-16281

HIGH GRAVITY ENVIRONMENTS
High G pyrotechnic shock simulation using metal-to-metal impact N80-16206

HIGH POWER LASERS
High-energy, short-pulse, carbon-dioxide lasers
[LA-UR-79-1203] N80-16326

HIGH RESOLUTION
High resolution saturation spectroscopy with CO2 lasers. Application to the nu sub 3 bands of SF6 and OsO4
[LA-UR-79-1913] N80-16123

HIGH SPEED
Design of turbine blades for effective slip damping at high rotational speeds N80-16219
Performance of computer-optimized tapered-roller bearings to 2.4 million DN
[NASA-TM-81414] N80-16342

HIGH TEMPERATURE
Development of a standard methodology for the correlation and extrapolation of elevated temperature creep and rupture data. Volume 2: A state-of-the-art review
[EPRI-FP-1062-VOL-2] N80-16152

HIGH TEMPERATURE PLASMAS
Pulse pileup effects of plasma electron temperature measurements by soft X-ray energy analysis
[ORNL/TM-6541] N80-16867

HIGH TEMPERATURE TESTS
Long-life fatigue test results for two nickel-base structural alloys
[KAPL-4105] N80-16150
Effect of heat treatment on the elevated temperature tensile and fracture toughness response of Alloy 718
[HEDL-TME-78-98] N80-16151

HIGH VOLTAGES
Planar multijunction high voltage solar cells
[NASA-TM-81389] N80-16914

HIGHWAYS
A study of highway embankment construction in South Carolina marshlands
[PB-300816/6] N80-16243
An evaluation of methodology for prediction and minimization of detrimental volume change of expansive soils in highway subgrades. Volume 1: Research report
[PB-301254/9] N80-16247

HOLOGRAPHY
Digital recording using hologram arrays: Some initial experiments in 100 M bit/s recording
[BBC-RD-1979/23] N80-16312

HOMOGENEITY
Standard reference materials: Micro-homogeneity studies of NBS standard reference materials, NBS research materials, and other related samples
[PB-300461/1] N80-16135

HONEYCOMB STRUCTURES
Some considerations of the performance of two honeycomb gas path seal material systems
[NASA-TM-81398] N80-16143

HONEYWELL COMPUTERS
Honeywell information systems COBOLA 0100
[PB-299652/B] N80-16749

HOT ELECTRONS
Stability of a toroidal plasma by hot electron annulus in a bumpy torus
[IPPJ-426] N80-16880
CO2-laser induced hot electron magneto-transport effects in n-InSb N80-16905

HOT-FILM ANEMOMETERS
Hot film anemometry. A bibliography with abstracts
[NTIS/PS-79/0909/6] N80-16318

HOT-WIRE ANEMOMETERS
Instrumentation for the measurement of turbulence components in a three-dimensional flow field
[AD-A073954] N80-16301
Hot wire anemometry, volume 2. A bibliography with abstracts
[NTIS/PS-79/0957/5] N80-16319
HOUSTON (TX)
HAOS quality assurance final report: Criteria pollutants, volume 1
[PB-299639/5] N80-16583
HAOS quality assurance: Non-criteria pollutants, volume 2
[PB-299640/3] N80-16584
HUGONIOT EQUATION OF STATE
Physics of mantle and core minerals --- Hugoniot data N80-16636
HUMAN BODY
Whole-body vibration of heavy equipment operators N80-16216
Research related to the expansion and improvement of human vibration exposure criteria N80-16217
HUMAN FACTORS ENGINEERING
Ground run-up noise control facilities for civil aircraft: A survey
[AD-A075348] N80-16067
A study of occupational heat stress by analysis of environmental and human factors N80-16735
Factors affecting computer program comprehension N80-16762
HUMAN PERFORMANCE
Multi-modal information processing for visual workload relief
[NASA-CR-162720] N80-16737
HUMAN REACTIONS
The Shock and Vibration Bulletin. Part 2: Modal and impedance analysis, human response to vibration and shock, isolation and damping, dynamic analysis
[NASA-CR-162472] N80-16211
HYDRAULIC EQUIPMENT
Liquid spring shock isolator modeling by system identification N80-16222
Long life hydraulic brake system, summary
[PB80-104730] N80-16350
HYDROCARBON COMBUSTION
A numerical model of high intensity confined hydrocarbon flames
[TAE-322] N80-16119
HYDROCARBON FUELS
Study of hydrocarbon-shale interaction
[ORO-5197-14] N80-16409
HYDROCARBONS
Development of high temperature subtractive column and chromatographic analysis of hydrocarbons present in diesel exhaust
[BETC/RI-78/12] N80-16130
THERPP: A Thermodynamic Properties Program
[TREE-1081-REV] N80-16929
HYDROCRACKING
Flash hydropyrolysis of coal
[BNL-51010] N80-16185
HYDRODYNAMIC RAM EFFECT
Test evaluation of shock buffering concept for hydrodynamic ram induced by yawing projectile impacting a simulated integral fuel tank N80-16209
HYDRODYNAMICS
Hydrodynamic equilibrium of plasma in an ambipolar trap
[UCRL-TRANS-11493] N80-16887
HYDROELECTRIC POWER STATIONS
Decentralized energy: Technology assessment and systems description
[BNL-50987] N80-16502
HYDROFOILS
Accuracy of hydrofoil loading predictions obtained from a lifting-surface computer program
[AD-A074702] N80-16233
HYDROGEN
The reduction of silica and mullite in hydrogen --- kinetics, thermodynamics, and mass transport phenomena N80-16115
Hydrogen diffusion, dissolution and permeation of nonmetallic solids
[ORO-4721-T1] N80-16124
Producing slush oxygen with an auger and measuring the storage characteristics of slush hydrogen
[NASA-CR-158412] N80-16256
The temperature and density dependence of the nuclear spin-spin interaction in HD_2 gas and fluid N80-16846
High resolution spectroscopy of the hydrogen Balmer-alpha line N80-16848
H 2 region-like galaxies --- analysis of hydrogen line spectra in galaxies N80-16995
HYDROGEN FUELS
Assessment of environmental and safety problems in hydrogen energy systems
[LA-UR-79-583] N80-16186
Experiments on H2-O2MHD power generation
[NASA-TM-81424] N80-16886
Hydrogen pellet fueling experiment on the ISX-A Tokamak
[ORNL/TM-6496] N80-16892
HYDROGEN PRODUCTION
Hydrogen as a fuel N80-16177
HYDROGEN-BASED ENERGY
Hydrogen as a fuel N80-16177
HYDROGEOLOGY
Determination of hydrologic parameters for glacial tills in Connecticut
[PB-300313/4] N80-16433
Geophysics of the Geysers geothermal field northern California N80-16639
HYDROLOGY
Hydrologic data on channel adjustments, 1970 to 1975, on the Rio Grande downstream from Cochiti Dam, New Mexico, before and after closure
[PB-301134/3] N80-16425
Strip coal mining and mined-land reclamation in the hydrologic system, southeastern Montana
[PB-301253/1] N80-16441
Hydrologic data from urban watersheds in the Tampa Bay region
[PB-301204/4] N80-16447
Bibliography of geology and hydrology, eastern New Mexico
[PB-300832/3] N80-16563
HYDROLOGY MODELS
Optimization techniques and numerical methods for aquifer management N80-16369
Flow routing in the Susquehanna River Basin. Part 3: Routing reservoir releases in the Tioga and Chemung Rivers System, Pennsylvania and New York
[PB-301393/5] N80-16415
A mathematical hydrodynamic circulation model of Great Salt Lake for resource management
[PB-299013/3] N80-16436
Application of transient-flow to the Sacramento River at Sacramento, California
[PB-301103/8] N80-16448
HYDROLYSIS
Autohydrolysis for improving methane yield from fermentation of lignocellulose N80-16175
HYDROMECHANICS
Shaft torsional oscillations of hydrogenerators
[PB80-102155] N80-16286
HYDROMETEOROLOGY
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10046] N80-16396
HYDROXYL EMISSION
A study of hydroxyl masers in the circumstellar envelopes of long period variable stars N80-16965
HYGROSCOPICITY
Composite materials research and education program: The NASA-Virginia Tech composites program
[NASA-CR-162719] N80-16101
HYPODYNAMIA
Morphological and functional manifestations of rat adrenal-cortex response to sodium bromide administration under hypodynamic stress
[NASA-TM-7593] N80-16719
Catecholamines and myocardial contractile function during hypodynamia and with an altered thyroid hormone balance
[NASA-TM-76000] N80-16720
HYPOKINESIA
Glucose metabolism in different regions of the rat brain under hypokinetic stress influence
[NASA-TM-75949] N80-16718
Effect of gravitation stress and hypokinesia on blood vessels of the testicle
[NASA-TM-75942] N80-16726

I

ICE
Solar altitude effects on ice Albedo
[PB-301252/3] N80-16440
ICHTHYOLOGY
Ichthyoplankton abundance and diversity in the eastern Gulf of Mexico
[PB-299839/1] N80-16624
ILLINOIS
Illinois LANDSAT feasibility study
[NASA-CR-162760] N80-16424
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438
ILLUMINATING
Simplified procedure for calculating the effects of daylight from clear skies
[LBL-9048] N80-16695
IMAGE ENHANCEMENT
Computer image generation texture study --- to enhance visual flight simulators
[AD-A074019] N80-16770
IMAGE PROCESSING
Evaluation of registration, compression, and classification algorithms. Volume 2: Documentation
[E80-10042] N80-16392
As-built design specification of software for cluster-based proportion estimation
[E80-10045] N80-16395
Synthetic aperture radar/LANDSAT MSS image registration
[NASA-RP-1039] N80-16405
Processing of multispectral thermal IR data for geologic applications
[NASA-CR-162682] N80-16651
VICAR image processing system guide to system use
[NASA-CR-162693] N80-16766
Computing region moments from boundary representations
[NASA-CR-162685] N80-16767
Computer image generation texture study --- to enhance visual flight simulators
[AD-A074019] N80-16770
A comparison of some simple methods for extracting texture primitives and their effectiveness in texture discrimination
[AD-A073956] N80-16771
Minicomputer-base interactive image processing
[LA-UR-79-1912] N80-16779
The development and application of environmental mapped data digitization, encoding, analysis, and display software for the ALICE system, volume 1
[ANL-79-71-VOL-1] N80-16780
IMAGE RESOLUTION
Comparability for UHF television: A preliminary analysis
[PB-301267/1] N80-16270
IMAGERY
Compton scatter in germanium and its effect of imaging with gamma-ray position-sensitive detectors
[CONF-781028-1] N80-16923
IMAGING TECHNIQUES
Computer image generation texture study --- to enhance visual flight simulators
[AD-A074019] N80-16770
IMMOBILIZATION
The significance of ACTH for the process of formation of complex heparin compounds in the blood during immobilization stress
[NASA-TM-75946] N80-16727
IMPACT DAMAGE
Scanning-electron-microscope study of normal-impingement erosion of ductile metals
[NASA-TP-1609] N80-16141
IMPACT LOADS
Orbiter landing loads math model description and correlation with ALT flight data
[NASA-RP-1056] N80-16091
Composite components under impact load and effects of defects on the loading capacity --- Alpha Jet tail assembly
[NASA-TM-75351] N80-16104
Assembly of interference fits by impact and constant force methods
[PB-301289/5] N80-16351

IMPACT STRENGTH
Effect of temperature on composite sandwich structures subjected to low velocity impact — aircraft construction materials
[NASA-CR-162718] N80-16103

IMPACT TESTS
An experimental design for total container impact response modeling at extreme temperatures
N80-16207
Terminal velocity and rotation rate of a flyer plate propelled by a tube-confined explosive charge
N80-16229

IMPLANTATION
Mossbauer measurements on low temperature (deuteron implanted Al(Co57)) N80-16906

IN-FLIGHT MONITORING
Expanded study of feasibility of measuring in-flight 747/JT9D loads, performance, clearance, and thermal data
[NASA-CR-159717] N80-16060

INCIDENT RADIATION
Normal incident solar radiation measurements at Upton, New York
[BNL-50939] N80-16653

INCOMPRESSIBLE FLOW
Turbulence measurements in the boundary layer of a low-speed wind tunnel using laser velocimetry
[NASA-TM-81185] N80-16300

INDEXES (DOCUMENTATION)
Auroral electrojet magnetic activity indices AE (11-12) for January - June 1975
[PB80-106974] N80-16657
Some statistical indicators of UK abstracting and indexing services
[BL-BLLRDR-5468] N80-16942
The use of form designs for catalogue input: A project involving the HP2645A display station
[BLL-BLRDR-5501] N80-16946

INDICATING INSTRUMENTS
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16877

INDIUM
Comparative low energy electron diffraction studies of InSb(110) and GaAs(110) surfaces N80-16911

INDIUM ANTIMONIDES
CO2-laser induced hot electron magneto-transport effects in n-InSb N80-16905

INDIUM COMPOUNDS
Emerging material systems for solar cell applications
[DOE/ET-23003/1] N80-16533

INDUSTRIAL ENERGY
Energy conservation in industry: The present approach, the future opportunities
[PB-301244/0] N80-16556

INDUSTRIAL PLANTS
A study of indirect fire losses from fires in non-residential properties. Volume 1: Research report
[PB-299126/3] N80-16241
Status of pollutant removal technology for coal fired plants in the northeastern U.S.
[BNL-51004] N80-16580

INDUSTRIAL SAFETY
Radiant heating of mine bulkheads
[PB-300363/9] N80-16444
Improved light scattering dust monitor
[PB-299938/1] N80-16445
A study of occupational heat stress by analysis of environmental and human factors N80-16735

INDUSTRIAL WASTES
Evaluation of the ultraviolet-ozone and ultraviolet-oxident treatment of pink water
[PB-300783/0] N80-16803
Anaerobic biological treatment of liquid wastes from pyrolysis processes
[COO-4455-2] N80-16723
Biological treatment of high strength petrochemical wastewater
[PB80-100456] N80-16959
Activated carbon treatment of industrial wastewaters: Selected technical papers
[PB80-100522] N80-16963

INERTIAL FUSION (REACTOR)
Fusion: The power sources of the future inertial confinement option
[UCRL-82768] N80-15858
Particle beam interactions with plasmas and their application to inertial fusion
[SAND-79-1411C] N80-16839

INFILTRATION
Treatment of secondary effluent by infiltration-percolation — Boulder, Colorado
[PB80-103658] N80-16973

INFORMATION DISSEMINATION
Dissemination of new ideas in librarianship and information work
[BLL-BLRDR-5482] N80-16940
The presentation of science by the media
[BLL-BLRDR-5494] N80-16943
Personal current awareness service: A handbook of techniques for manual SDI
[BLRDR-5502] N80-16947
Information transfer in the Office of Research and Development — relating to environment protection studies
[PB80-101371] N80-16972

INFORMATION FLOW
Designing information: Some approaches, some problems and some suggestions — conference
[BLL-BLRDR-5509] N80-16938

INFORMATION MANAGEMENT
Technology assessment: ADP installation performance measurement and reporting
[PB80-101322] N80-16751

INFORMATION RETRIEVAL
Linking of the mini-computer Electronik-1001 and NR-9821A
[NASA-TM-75670] N80-16743
Experience in using the librarian as an aid in managing large-scale data bases
[K/CSD/INF-78/4] N80-16937
Statistical bases of relevance assessment for the ideal information-retrieval test collection
[BLL-BLRDR-5481] N80-16939

INFORMATION SYSTEMS
Information approach to parts rating — for use on assembly systems for industrial engineering and product engineering
[PB-300519/6] N80-16352
NCSL remote sensing project — State Legislature considerations and activities
[E80-10053] N80-16401
An investigation of preferences for various types of energy cost feedback — information feedback system to determine energy consumption costs
[PB-300314/2] N80-16560
Energy Research Information System (ERIS) projects report, volume 4, number 1 — bibliographies
[PB-300338/1] N80-16561
Fine particle emissions information system
[PB80-100440] N80-16589
Honeywell information systems COBOLA 0100
[PB-299652/3] N80-16749
Technology assessment: ADP installation performance measurement and reporting
[PB80-101322] N80-16751
Optimal information acquisition for randomly occuring decisions
[AD-A074956] N80-16804
Contingency factors affecting the user involvement role in the design of successful information systems
N80-16936
Statistical bases of relevance assessment for the ideal information retrieval test collection
[BLL-BLRDR-5481] N80-16939
Dissemination of new ideas in librarianship and information work
[BLL-BLRDR-5482] N80-16940
CAB/cain evaluation project: A comparative study on the performance of two agricultural databases in a computerized current awareness service
[BLL-BLRDR-5483] N80-16941
Some statistical indicators of UK abstracting and indexing services
[BL-BLLRDR-5468] N80-16942
An experiment in synopsis publishing in the field of mechanical engineering
[BLL-BLRDR-5498] N80-16945
The use of form designs for catalogue input: A project involving the HP2645A display station
[BLL-BLRDR-5501] N80-16946
Information systems in UK agriculture
[BLL-BLRDR-5499] N80-16948

INFRARED ABSORPTION
An optical investigation of the correlation between mass transport and mechanical properties of strained polymer films N80-16161

INFRARED DETECTORS
Infrared runway collision avoidance system analysis — carbon dioxide lasers
[AD-A078131] N80-16069

INFRARED IMAGERY
Processing of multispectral thermal IR data for geologic applications
[NASA-CR-162582] N80-16651

INFRARED LASERS
Carbon dioxide lasers, volume 3: A bibliography with abstracts
[NTIS/PS-79/1067/2] N80-16334
A twin optically-pumped far-infrared CH3OH laser for plasma diagnostics — Tokamak devices
[IPPJ-428] N80-16962

INFRARED PHOTOGRAPHY
Remote sensing of sulfur dioxide effects on vegetation - photometric analysis of aerial photographs
[PB-300460/3] N80-16600

INFRARED SPECTRA
Infrared measurements of a scrampjet exhaust — to determine combustion efficiency
[NASA-CR-3242] N80-16059

INORGANIC NITRATES
Nitrate in effluents from irrigated lands — Santa Maria Valley
[PB-300582/4] N80-16587
Air quality data for nonmetallic inorganic ions: NH4+, NO3-, SO4= from the National Air Surveillance Networks, 1976
[PB-300458/7] N80-16599
Detailed characterization of gaseous and size resolved/particulate pollutants at a south coast air basin smog receptor site: levels and modes of formation of sulfate, nitrate and organic particulates and their implications for control strategies
[PB-301294/3] N80-16811

INPUT
Contingency factors affecting the user involvement role in the design of successful information systems
N80-16936

INSOLATION
Solar availability for winter space heating: An analysis of the calendar period 1953-1975
[ANL/SPG-14] N80-16532

INSPECTION
The development of quantitative NDI for retirement-for-cause
[AD-A055403] N80-16035

INSTRUMENT APPROACH
Space vehicle approach procedures described
N80-16077

INSTRUMENT COMPENSATION
Instrumentation modeling technique used in the identification of aerodynamic coefficients from flight test data
[SAND-78-0721C] N80-16039

INSTRUMENT ERRORS
A spectral filter for ESMR's sidelobe errors
[NASA-TM-80555] N80-16402

INSTRUMENT LANDING SYSTEMS
Dipole broadside glide slope array — for landing systems
[AD-A077042] N80-16047

INSTRUMENT PACKAGES
Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218

INSTRUMENT RECEIVERS
Interface assembly for use in R 1520 system described N80-17019

INSULATORS
Improving the voltage holdoff performance of alumina insulators in vacuum through quasimetallizing
[GEPP-TIS-441] N80-16285

INTEGRATED ENERGY SYSTEMS
Prototype solar heating and combined heating cooling systems
[NASA-CR-161340] N80-16485

INTERFACE STABILITY
Stability analysis of interfacial circulation on a static liquid drop with forced internal circulation
N80-16290

INTERFEROMETRY
Heterodyne spatial interferometry of circumstellar dust shells at a wavelength of 11 microns
N80-16992

INTERLAYERS
Increased fracture toughness of graphite-epoxy composites through intermittent interlaminar bonding — Mylar interlayer
[NASA-CR-159198] N80-16106

INTERNAL COMBUSTION ENGINES
Scaling of some flowfields with flames — internal combustion engines
[CONF-7811102-2] N80-16305

INTERNATIONAL COOPERATION
International investigation of the magnetosphere
N80-16076
Objectives and strategies of the International Photovoltaic Program Plan
[SERI/TR-52-250] N80-16513

INTERPOLATION
FORTRAN subroutines for bicubic spline interpolation
[ORNL/CSD/TM-67] N80-16777

INTERSTELLAR GAS
EUV observations of the local ism N80-16982

INTERSTELLAR MATTER
Studies of the local interstellar medium
[NASA-CR-162749] N80-16997

INTERSTITIALS
The effects of interstitial impurities radiation temperature on voids swelling and irradiation hardening in the neutron irradiated molybdenum N80-16139

INVENTORY MANAGEMENT
Scientific management of the repairable item inventory system
[AD-A074259] N80-16833
Some statistical indicators of UK abstracting and indexing services
[BL-BLLRDR-5488] N80-16942

INVERSIONS
Investigation of seismic sources by the linear inversion of seismograms — fracture mechanics
N80-16637

INVERTERS
Workshop on Power Conditioning for Alternative Energy Technologies, executive summary
[SERI-TP-35-217-PT-E] N80-16905

INVISCID FLOW
Development of panel methods for subsonic analysis and design
[NASA-CR-3234] N80-16033

ION ACCELERATORS
Pinched relativistic electron beams and collective acceleration of ions N80-16274
Use of lasers for accelerator diagnostics. 1: Elementary concepts
[LA-UR-79-2329] N80-16324
QUARTZ: A numerical simulation of an asymmetric electrostatic accelerator
[CONF-790619-2] N80-16989

ION BEAMS
Homogeneous alignment of nematic liquid crystals by ion beam etched surfaces
[NASA-TM-81378] N80-16232
Interactions of molecular and ion beams with surfaces — bibliographies
[AD-A073278] N80-16853

ION DENSITY (CONCENTRATION)
Analysis of numerical ionograms. 2: The valley program
[IPS-X8] N80-16648

ION DISTRIBUTION
Analysis of solar wind data from the SOLRAD 11A and 11B spacecraft
[AD-A070945] N80-17099

ION IMPLANTATION
Formation of supersaturated alloys by ion implantation and pulsed-laser annealing N80-16137
Corrosion behavior of Ni implanted steel
N80-16139
Cw laser annealing of ion implanted single crystal silicon N80-16320

ION PROPULSION
Electric propulsion for near-Earth space missions
[NASA-CR-159726] N80-16894

IONIC COLLISIONS
Theory of heavy ion collisions
[CDO-3483-91] N80-16862

IONIC REACTIONS
Central collisions in intermediate energy heavy-ion reaction
[CONF-790743-5] N80-16854

IONIZATION
Analysis of numerical ionograms. 3: The valley program
[IPS-X8] N80-16648
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 2: The effect of non-Maxwellian electron distribution functions on ionization equilibrium calculations for carbon, nitrogen and oxygen
[NASA-CR-162695] N80-16652

IONOGRAMS
Analysis of numerical ionograms. 3: The valley program
[IPS-X8] N80-16648

IONOSPHERIC DISTURBANCES
International investigation of the magnetosphere
N80-16076

IONOSPHERIC STORMS
Ionospheric storm effects on maximum usable frequencies on circuits around Australia
[IPS-R-35] N80-16647

IONS
Two-dimensional eigenmode analysis of the trapped-ion instability N80-16878

IOWA
Preliminary geologic appraisal and economic aspects of the Precambrian basement of Iowa
N80-16633

IRON
Energy spectra of cosmic ray nuclei to above 100 GeV/nucleon — measurement of energy spectra of cosmic ray nuclei boron to iron
[NASA-TM-80587] N80-17011

IRON ALLOYS
Illustration of ternary diagram synthesis-Mn-Ti-Fe and Al-Ti-Fe
[BNL-26392] N80-16153

IRON COMPOUNDS
High resolution saturation spectroscopy with CO2 lasers. Application to the nu sub 3 bands of SF6 and OsO4
[LA-UR-79-1913] N80-16123
Magnetic properties of selected transition metal compounds N80-16136

IRRADIANCE
Design of a reflection on apparatus for laser beam profile measurements
[PB80-101256] N80-16877

IRRADIATION
The effects of interstitial impurities radiation temperature on voids swelling and irradiation hardening in the neutron irradiated molybdenum N80-16139

IRRIGATION
Irrigation practices and return flow salinity in Grand Valley
[PB80-103609] N80-16416
Solar powered agricultural irrigation pumping
[PB-299294/9] N80-16570
Nitrate in effluents from irrigated lands — Santa Maria Valley
[PB-300582/4] N80-16587

ISLANDS
Design characteristics of the 224 kW Magdalen Islands VAWT N80-16463
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, volume 3. Area 17, Tahiti Island and Moorea Island; area 18, Tuamotu Archipelago; area 19, Pitcairn Island; area 20, Easter Island; area 21, Isla San Ambrosio and Isla San Felix; area 22, Islas Juan Fernandez; area 23, Norfolk Island; area 24, Chatham Island
[AD-A073874] N80-16685

ISOCYANATES
Thermal stability of isocyanate based polymers
N80-16162

ISOTOPES
Conversion of isotope compounds to metal by reduction-distillation methods
[CONF-780943-2] N80-16125

ISOTROPIC MEDIA
Steady state response of a circular foundation on a transversely isotropic medium N80-16369

ITERATIVE SOLUTION
Iterative solution of linear programs
[ANL-79-75] N80-16778
EXPALS: FORTRAN code for exponential approximation by least squares
[UCRL-14541-REV-2] N80-16782
Fast algorithms for solving path problems
[AD-A074079] N80-16806

J

JET AIRCRAFT
The aerodynamics of a jet in a crossflow
[AD-A076375] N80-16034

JET BOUNDARIES
An experimental study of multiple jet mixing
N80-16292

JET ENGINES
Expanded study of feasibility of measuring in-flight 747/JT9D loads, performance, clearance, and thermal data
[NASA-CR-159717] N80-16063

JET EXHAUST
Air pollution from aircraft
[NASA-CR-159712] N80-16060

JET MIXING FLOW
An experimental study of multiple jet mixing
N80-16292

JETTISON SYSTEMS
Solar maximum mission panel jettison analysis remote manipulator system
[NASA-CR-162466] N80-16073

JOINTS (JUNCTIONS)
Effectiveness of neoprene seals in preventing concrete pavement contraction joint deterioration
[PB-300594/9] N80-16244

JUPITER (PLANET)
Narrow-band Jovian kilometric radiation: A new radio component
[NASA-TM-80626] N80-17001
The occurence rate, polarization character and intensity of broadband Jovian kilometric radiation — Voyager Project
[NASA-TM-80627] N80-17002
Voyager 1: Encounter with Jupiter
[NASA-CR-162721] N80-17003

K

KALMAN FILTERS
Aerodynamic coefficient estimation by means of an extended Kalman filter — to study dynamic models of reentry vehicle motion
[SAND-79-0411C] N80-16039

KANSAS
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394

KENTUCKY
Environmental assessment of surface mining methods: Head-of-hollow fill and mountaintop removal
[PB-300540/2] N80-16622

KINEMATICS
Design of disc cams with translating roller followers: Calculation methods
[ESDU-79007] N80-16335

L

LAKE ICE
Measurement of eddy diffusivity and solute transport through the near-sediment boundary layer of ice-covered lakes, using Radon-222 N80-16390

LAKES
Phytoplankton water quality relationships in US lakes. Part 1: Methods, rationale and data limitations
[PB-298439/1] N80-16419
Phytoplankton water quality relationships in US lakes. Part 2: Genera Acanthosphaera through Cystodinium Collected from eastern and southeastern lakes
[PB-298440/9] N80-16420
Phytoplankton water quality relationships in US lakes. Part 3: Genera Dactylococcopsis through Gyrosigma collected from eastern and southeastern lakes
[PB-298441/7] N80-16421

Phytoplankton water quality relationships in US lakes. Part 4: Genera Hantzchia through Pteromonas collected from eastern and southeastern lakes
[PB-298442/5] N80-16422
Phytoplankton water quality relationships in US lakes. Part 5: Genera Quadrigula through Zygnema collected from eastern and southeastern lakes
[PB-298443/3] N80-16423

LAMINAR FLOW
Transitional flow in an annulus N80-16269
Numerical solution of three-dimensional natural convection by the strongly implicit procedure
[DP-MS-78-14] N80-16310
Prediction of laminar and turbulent flow heat transfer in annular passages
[PB-299867/2] N80-16311

LAMINATES
Fracture modes of high modulus graphite/epoxy angleplied laminates subjected to off-axis tensile loads
[NASA-TM-81405] N80-16102
Increased fracture toughness of graphite-epoxy composites through intermittent interlaminar bonding --- Mylar interlayer
[NASA-CR-159198] N80-16106
Testing the interlaminate adhesion of multilayer printed wiring boards
[BDX-613-2011] N80-16169
A penalty plate-bending element for the analysis of laminated anisotropic composite plates
[AD-A074236] N80-16375
Finite-element analysis of laminated biomodulus composite-material plates
[AD-A074184] N80-16376

LAND MANAGEMENT
Environmental impact and economic evaluation research needs for coastal and marine resource management
[PB-301208/5] N80-16504

LAND USE
NCSL remote sensing project --- State Legislature considerations and activities
[E80-10053] N80-16401
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438
Strip coal mining and mined-land reclamation in the hydrologic system, southeastern Montana
[PB-301253/1] N80-16441
The interaction between urbanization and land quality and quantity in environmental planning and design: The public institutions model technical documentation
[PB-301112/9] N80-16952
The interaction between urbanization and land quality and quantity in environmental planning and design. The housing model technical documentation
[PB-301111/1] N80-16953
The interaction between urbanization and land quality in environmental planning and design: The transportation model technical documentation
[PB-300981/8] N80-16967
The interaction between urbanization and land quality and quantity in environmental planning and design: The land value model technical documentation
[PB-301047/7] N80-16968
Local and regional development and transportation needs
[PB-301207/7] N80-16970

LANDAU-GINZBURG EQUATIONS
Ginzburg-Landau theory and the superconducting transition in thin, amorphous bismuth films N80-16912

LANDING MATS
Backscatter response of snow covered roads and roadside surfaces
[SAND-79-7046] N80-16413

LANDING SPEED
Design considerations for attaining 200-knot test velocities at the aircraft landing loads and traction facility
[NASA-TM-80096] N80-16071

LANDSAT SATELLITES
Illinois LANDSAT feasibility study
[NASA-CR-162760] N80-16424

LANGUAGE PROGRAMMING
INFORM: An interactive data collection and display program with debugging capability
[NASA-TP-1424] N80-16742
Factors affecting computer program comprehension N80-16762

LAP JOINTS
Inelastic shear stresses and strains in the adhesives bonding lap joints loaded in tension or shear (computer program) --- used in aircraft wing, fuselage, and furnishing components
[ESDU-79016] N80-16363

LAPLACE TRANSFORMATION
Numerical inversion of Laplace transforms
[AD-A074438] N80-16802

LARGE AREA CROP INVENTORY EXPERIMENT
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394
Large Area Crop Inventory Experiment (LACIE). Detailed description of the wheat acreage estimation procedure used in the Large Area Crop Inventory Experiment
[E80-10051] N80-16399
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400

LARGE SCALE INTEGRATION
Investigation of requirements and implementation of facilities for connecting UK hosts to Euronet
[BLL-BLRDR-5508] N80-16788
Radiation-hardened bulk CMOS technology
[SAND-79-0714C] N80-16919

LARGE SPACE STRUCTURES
Control of large space structures
[NASA-CR-161369] N80-16082
Study of foldable elastic tubes for large space structure applications, phase 1
[NASA-CR-162652] N80-16083

LASER APPLICATIONS
Use of lasers for accelerator diagnostics. 1: Elementary concepts
[LA-UR-79-2329] N80-16324
Step-by-step approach to convective cooling of laser disc amplifiers
[UCRL-15047] N80-16327
Carbon dioxide lasers, volume 4. A bibliography with abstracts
[NTIS/PS-79/1068/0] N80-16333
Fusion laser studies
[NVO-1559-1] N80-16897

LASER DAMAGE
Statistical analysis of absorptive laser damage in dielectric thin films
[UCRL-81670] N80-16325

LASER DOPPLER VELOCIMETERS
Particle size measurements in solid propellant rocket exhaust plumes
[AD-A073556] N80-16098
Turbulence measurements in the boundary layer of a low-speed wind tunnel using laser velocimetry
[NASA-TM-81165] N80-16300
Laser Doppler velocity simulator --- to induce frequency shift
[NASA-CASE-LAR-12176-1] N80-16321
Nonorthogonal measurement axes in laser Doppler velocimetry
[AD-A073700] N80-16323

LASER FUSION
High-energy, short-pulse, carbon-dioxide lasers
[LA-UR-79-1203] N80-16326
Mass spectrometer determination of argon contents in laser fusion target pellets
[UCRL-81416-REV-1] N80-16331
Factors affecting potential market penetration of laser fusion power plants
[PNL-2803] N80-16552
Mirror position display equipment for the target chamber mirror mounts of the LASL Helios laser fusion facility
[LA-UR-79-569] N80-16894
Fusion laser studies
[NVO-1559-1] N80-16897

LASER HEATING
Formation of supersaturated alloys by ion implantation and pulsed-laser annealing N80-16137
Cw laser annealing of ion implanted single crystal silicon N80-16320
Analysis of the Z dependence of laser generated suprathermal electron temperature
[UCRL-82280] N80-16330

LASER OUTPUTS
Antares power amplifier optical system
[LA-UR-79-2270] N80-16332
Design of a reflection on apparatus for laser beam profile measurements
[PB80-101256] N80-16877

LASER PLASMA INTERACTIONS
Analysis of the Z dependence of laser generated suprathermal electron temperature
[UCRL-82280] N80-16330

LASER PUMPING
A twin optically-pumped far-infrared CH3OH laser for plasma diagnostics --- Tokamak devices
[IPPJ-428] N80-16882

LASER SPECTROSCOPY
Double resonance spectroscopy of multiple-photon excited molecules
[COO-2793-15] N80-16858

LASER TARGETS
Evaluation of the effect of prepulses on HF laser-target interactions
[SAND-79-0353] N80-16329

LASERS
Conceptual development of the Laser Beam Manifold (LBM)
[NASA-TM-78248] N80-16322
Evaluation of commercially available laser protective eyewear
[PB80-103039] N80-16741

LATTICE VIBRATIONS
Energy dispersion and relaxation in propynal using laser IR/visible double resonance
[COO-4695-2] N80-16381
Low energy electron vibrational excitation of molecules adsorbed on surfaces: Experiment and theory N80-16542
Tests of new theories for crystal anharmonicity N80-16908

LAUNCHING
The 1930 GSRS, missile numbers 1115, 1116, 1117, round numbers V-58, V-59, V-60, 30 July 1979
[AD-A074981] N80-16690
The 19702A GSRS, missile number 340, round number B-27, 6 August 1979
[AD-A074982] N80-16691

LAW (JURISPRUDENCE)
Space shuttle operational planning, policy and legal issues
[GPO-53-649] N80-16088
The Environmental Protection Agency's role in the protection of wetlands: Examination of EPA's participation in the section 404 regulatory program N80-16574
Impact of air quality control measures
[PB-301234/1] N80-16605

LEAD (METAL)
Geology and skarn ore mineralization of the Yeonhwa-Ulchin zinc-lead mining district, southeastern Taebaegsan region, Korea N80-16634

LEAD ACID BATTERIES
An averaging battery model for a lead-acid battery operating in an electric car
[NASA-TM-79321] N80-16824

LEAST SQUARES METHOD
Instrumentation modeling technique used in the identification of aerodynamic coefficients from flight test data
[SAND-78-0721C] N80-16038
EXPALS: FORTRAN code for exponential approximation by least squares
[UCRL-14541-REV-2] N80-16752
Comparison of nonlinear least squares software
[SAND-79-0483] N80-16754
ALLS, a generalized crystallographic least squares program
[IS-4708] N80-16918

LENS DESIGN
Conceptual development of the Laser Beam Manifold (LBM)
[NASA-TM-78248] N80-16322

LIAPUNOV FUNCTIONS
Applications of centre manifold theory
[AD-A074052] N80-16829

LIBRARIES
Review of management information from computer-based circulation systems in academic libraries
[BLL-BLRDR-5471] N80-16935
Dissemination of new ideas in librarianship and information work
[BLL-BLRDR-5482] N80-16940

The use of form designs for catalogue input: A project involving the HP2645A display station
[BLL-BLRDR-5501] N80-16946
Personal current awareness service: A handbook of techniques for manual SDI
[BLRDR-5502] N80-16947

LIFE (DURABILITY)
The development of quantitative NDI for retirement-for-cause
[AD-A068403] N80-16355
A maximum likehood estimator for an exponential parameter from a life test with both type 1 and type 2 censoring
[AD-A073895] N80-16358
Confidence intervals for an exponential parameter from a two stage life test — probability density functions
[AD-A073896] N80-16359
Approximate confidence intervals for an exponential parameter from a sequential life test
[AD-A073897] N80-16360
Shelf-life determination of epoxy prepregs and film adhesives
[BDX-613-2110] N80-16922

LIFT
Wing flapping with minimum energy — minimize the drag for a bending moment at the wing root
[NASA-TM-81174] N80-16035
A comparison of calculated and experimental lift and pressure distributions for several helicopter rotor sections
[NASA-TM-81160] N80-16036
Summary of theoretical and experimental investigations of vortex lift at high angles of attack
[AD-A074483] N80-16037

LIFT DEVICES
Accuracy of hydrofoil loading predictions obtained from a lifting-surface computer program
[AD-A074702] N80-16233

LIFT FANS
Investigation of ground effects on large and small scale models of a three fan V/STOL aircraft configuration
[NASA-CR-152240] N80-16030
JEFF(A) mixed-flow model fan performance optimization
[AD-A074571] N80-16234

LIGHT (VISIBLE RADIATION)
Simplified procedure for calculating the effects of daylight from clear skies
[LBL-9048] N80-16695

LIGHT EMISSION
UBVR observation of V1357 Cyg = Cyg X-1. Search of the optical radiation of the accretion disk
[NASA-TM-75677] N80-16988

LIGHT SCATTERING
Light scattering studies of solids and atomic vapors
[LBL-8222] N80-16173
The structure and microphysical properties of the clouds of Venus
[NASA-TM-75725] N80-17006

LIGHT SCATTERING METERS
Improved light scattering dust monitor
[PB-299938/1] N80-16445

LIGHT SOURCES
A computational model describing the initiation of silver acetylide-silver nitrate explosive by an intense light source N80-16228
Thermoluminescence dating apparatus efficiency measurement using a standard light source
[BNL-24525] N80-16314

LIGHTNING
FAA lightning protection study: Report of investigations relative to providing lightning protection for the Remote Center Air-to-Ground (RCAG)
[AD-A076943] N80-16259

LIGNIN
Autohydrolysis for improving methane yield from fermentation of lignocellulose N80-16175

LINE SPECTRA
H 2 region-like galaxies — analysis of hydrogen line spectra in galaxies N80-16995

LINEAR ACCELERATORS
Use of lasers for accelerator diagnostics. 1: Elementary concepts
[LA-UR-79-2329] N80-16324

LINEAR PREDICTION
Variance approximations for estimators of fixed and random effects in mixed linear models N80-16796

LINEAR PROGRAMMING
Some N by DN linear complementarity problems solvable by a principal pivoting algorithm with applications
[AD-A073929] N80-16772
Iterative solution of linear programs
[ANL-79-75] N80-16778

LINEAR SYSTEMS
A stability theorem for a dynamically loaded linear viscoelastic structure N80-16230
Output ensemble average of periodically excited linear time-varying systems — applicable to a missile intercept problem
[TAE-372] N80-16798
Linear and nonlinear stochastic operators N80-16813

LINEAR TRANSFORMATIONS
Transformational structure of algebraic logics N80-16793

LIQUEFIED NATURAL GAS
Chemical kinetics in LNG detonations
[UCRL-82293-REV-1] N80-16180
Remote sensing for diagnosing vapor dispersion in spills of liquid energy fuels
[UCID-18237] N80-16406

LIQUID CHROMATOGRAPHY
Development of high temperature subtractive column and chromatographic analysis of hydrocarbons present in diesel exhaust
[BETC/RI-78/12] N80-16130

LIQUID COOLED REACTORS
Heavy-section steel technology program — for liquid cooled reactor materials
[NUREG-CR-0618] N80-16235

LIQUID CRYSTALS
Homogeneous alignment of nematic liquid crystals by ion beam etched surfaces
[NASA-TM-81378] N80-16232
Dynamics near the phase transitions in liquid crystals N80-16909

LIQUID FILLED SHELLS
Static tilt test of a tail cylindrical liquid storage tank
[PB-301167/3] N80-16255

LIQUID HELIUM 2
Second sound shock waves and critical velocities in liquid helium 2
[NASA-CR-162667] N80-16837

LIQUID HYDROGEN
Safety of liquid hydrogen in air transportation
[LA-UR-79-1416] N80-16236

LIQUID ROCKET PROPELLANTS
Homogeneous vortex model for liquid slosh in spinning spherical tanks
[NASA-CR-162725] N80-16299

LIQUID SLOSHING
Homogeneous vortex model for liquid slosh in spinning spherical tanks
[NASA-CR-162725] N80-16299

LIQUID-SOLID INTERFACES
Evaluation of Lagrangian, Eulerian, arbitary Lagrangian-Eulerian methods for fluid-structure interaction problems in HCDA analysis
[CONF-790802-55] N80-16295
Quasi-Eulerian formulation for fluid-structure interaction
[CONF-790802-66] N80-16306

LOAD TESTS
Fracture modes of high modulus graphite/epoxy angleplied laminates subjected to off-axis tensile loads
[NASA-TM-81405] N80-16102

LOADS (FORCES)
The effects of frequency, amplitude, and load on the dynamic properties of elastomers N80-16221

LOKI ROCKET VEHICLE
Results of the August 1977 Soviet and American meterological rocketsonde intercomparison held at Wallops Island, Virginia
[NASA-RP-1053] N80-16682

LONG RANGE WEATHER FORECASTING
Month and year ahead forecasting of monthly precipitation for the southeastern United States N80-16670

LONGITUDINAL CONTROL
The aerodynamics of tracked ram air cushion vehicles - effects of pitch attitude and upper surface flow
[PB80-101827] N80-16041
Vehicle longitudinal control and reliability project. A review of AGT propulsion, power conditioning, braking and power distribution technology, volume 2, part C
[PB-300373/8] N80-16954

LONGITUDINAL STABILITY
Vehicle longitudinal control and reliability project. A review of entrainment technology
[PB-300372/0] N80-16955

LORAN C
Results of a Loran-C flight test using an absolute data reference
[NASA-CR-162751] N80-16051

LOW COST
Large, low cost composite wind turbine blades N80-16475

LOW DENSITY MATERIALS
Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides — flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116

LOW DENSITY RESEARCH
Aerodynamic heating of high-speed flywheels in low-density environments
[SAND-78-0957] N80-16548

LOW FREQUENCIES
An impedance technique for determining low frequency payload environments — Space Transportation System N80-16212

LOW LEVEL TURBULENCE
Stability of a turbulent layer cloud within the planetary boundary layer N80-16641

LOW SPEED
Effect of temperature on composite sandwich structures subjected to low velocity impact — aircraft construction materials
[NASA-CR-162718] N80-16103

LOW SPEED WIND TUNNELS
Recent research on V/STOL test limits at the University of Washington aeronautical laboratory
[NASA-CR-3237] N80-16068

LOWER CALIFORNIA (MEXICO)
Vertical movement along the Cerro Prieto transform fault, Baja California, Mexico - a mechanism for geothermal energy renewal
[LBL-8905] N80-16652

LUBRICANTS
Mechanisms of lubrication and wear of a bonded solid lubricant film
[NASA-TM-81396] N80-16185

LUBRICATION
Thermal elastohydrodynamic lubrication of spur gears
[NASA-CR-3241] N80-16337

LUMINESCENCE
Light scattering studies of solids and atomic vapors
[LBL-8222] N80-16173

LUMINOUS INTENSITY
Optimum intensity setting of approach and runway light systems
[AD-A075485] N80-16046

LUNAR MAGNETIC FIELDS
Lunar magnetism and plasma interactions N80-16999

LUNAR PHOTOGRAPHY
Analysis of erosion and transportation features from lunar orbiter and Apollo photography
[NASA-CR-162703] N80-17005

LUNAR SOIL
Analysis of erosion and transportation features from lunar orbiter and Apollo photography
[NASA-CR-162703] N80-17005

LUNAR SURFACE
Analysis of erosion and transportation features from lunar orbiter and Apollo photography
[NASA-CR-162703] N80-17005

M

MACHINERY
Whole-body vibration of heavy equipment operators N80-16218

MAGNETIC ANOMALIES
Auroral electrojet magnetic activity indices AE (11-12) for January - June 1975
[PB80-106974] N80-16857
Lunar magnetism and plasma interactions N80-16999

MAGNETIC FIELD CONFIGURATIONS
Stability of the field-reversed mirror — derived from vlasov equations
[COO-2218-136] N80-16889
MAGNETIC FIELDS
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air
N80-16257
The annihilation model of the Tormac sheath
N80-16876
Aspects of Tokamak toroidal magnet protection
[COO-2431-6] N80-16900
MAGNETIC MIRRORS
Stability of the field-reversed mirror — derived from vlasov equations
[COO-2218-136] N80-16889
Review of electron-beam heating of magnetic mirror confined plasmas, with application to the Tandem Mirror Experiment
[UCRL-52759] N80-15898
MAGNETIC PROPERTIES
Magnetic properties of selected transition metal compounds N80-16136
Magnetic critical temperature gap in Gd-Y alloys
[ISM-229] N80-16916
MAGNETIC RELAXATION
Energy dispersion and relaxation in propynal using laser IR/visible double resonance
[COO-4695-2] N80-16381
MAGNETIC SPECTROSCOPY
Study of energetic electrons in the outer radiation-belt regions using data obtained by the LLL spectrometer on OGO-5 in 1968
[UCRL-52807] N80-17013
MAGNETIC STORMS
Computed voltage distributions around solar electric propulsion spacecraft
[NASA-TM-79266] N80-16094
MAGNETIC SURVEYS
Magnetic results from Nurmijaervi geophysical observatory, 1978
[ISBN-951-697-125-3] N80-16645
MAGNETOHYDRODYNAMIC GENERATORS
Experiments on H2-O2MHD power generation
[NASA-TM-81424] N80-16886
MAGNETOHYDRODYNAMIC STABILITY
Stability of a toroidal plasma by hot electron annulus in a bumpy torus
[IPPJ-426] N80-16860
Hydrodynamic equilibrium of plasma in an ambipolar trap
[UCRL-TRANS-11493] N80-16867
Stability of the field-reversed mirror — derived from vlasov equations
[COO-2218-136] N80-16889
High beta Tokamaks
[CONF-780811-23] N80-16891
MAGNETOHYDRODYNAMICS
Simulation of MHD and steam cycle facility
[DOC-80SDS006] N80-16450
Plasma physics and problems of controlled thermonuclear reactions
[UCRL-TRANS-11487] N80-16888
MAGNETORESISTIVITY
CO2-laser induced hot electron magneto-transport effects in n-InSb N80-16905
MAGNETOSPHERE
USSR Report: Space, no. 1
[JPRS-74805] N80-16075
International investigation of the magnetosphere
N80-16076
MAGNETOSPHERIC INSTABILITY
International investigation of the magnetosphere
N80-16075
MAGNETS
Aspects of Tokamak toroidal magnet protection
[COO-2431-6] N80-16900
MAINTENANCE
Cost of energy evaluation N80-16482
Scientific management of the repairable item inventory system
[AD-A074259] N80-16933
MAN ENVIRONMENT INTERACTIONS
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438
MAN MACHINE SYSTEMS
Air traffic control/full beacon collision avoidance system, Knoxville simulation
[AD-A074555] N80-16043
Development of precutaneous energy transmission
[PB-300516/6] N80-16732
Multi-modal information processing for visual workload relief
[NASA-CR-162720] N80-16737
Physical testing of polymers for use in circulatory assist devices
[PB80-101546] N80-16740
The design and implementation of user oriented systems N80-16785
MANAGEMENT INFORMATION SYSTEMS
Review of management information from computer-based circulation systems in academic libraries
[BLL-BLRDR-5471] N80-16935
Experience in using the librarian as an aid in managing large-scale data bases
[K/CSD/INF-78/4] N80-16937
Designing information: Some approaches, some problems and some suggestions — conference
[BLL-BLRDR-5509] N80-16938
MANAGEMENT METHODS
Comparability for UHF television: A preliminary analysis
[PB-301267/1] N80-16270
Optimization techniques and numerical methods for aquifer management N80-16389
Low-level radioactive waste management. Volume 2: Forecast of low-level radwaste management requirements
[PB80-105059] N80-16973
Low-level radioactive waste management. Volume 3: Feasibility of volume-reduction processes — for waste treatment
[PB80-105067] N80-16974
MANAGEMENT PLANNING
Heuristic decision rules for water resources planning
[PB-300578/2] N80-16435
Satellite Power System (SPS)
[NASA-TM-80943] N80-16484
Information transfer in the Office of Research and Development — relating to environment protection studies
[PB80-101371] N80-16972
MANEUVERABILITY
Optimum reentry trajectories of a lifting vehicle
[NASA-CR-3236] N80-16080
MANGANESE ALLOYS
Illustration of ternary diagram synthesis-Mn-Ti-Fe and Al-Ti-Fe
[BNL-26392] N80-16153
MANGANESE COMPOUNDS
Magnetic properties of selected transition metal compounds N80-16136
MANIFOLDS (MATHEMATICS)
Smooth group actions of prime order and fixed point sets N80-16791
Applications of centre manifold theory
[AD-A074052] N80-16829
MANUALS
Midtemperature solar systems test facility experiment manual and test plan
[SAND-79-0379] N80-16526
Personal current awareness service: A handbook of techniques for manual SDI
[BLRDR-5502] N80-16947
MANUFACTURING
Aluminum or copper substrate panel for selective absorption of solar energy
[NASA-CASE-MFS-23518-3] N80-16452
Manufacturing methods of a composite cell case for a Ni-Cd battery
[NASA-CR-162724] N80-16488
Solar collector manufacturing activity
[DOE/EIA-0174/78] N80-16500
MANY BODY PROBLEM
On the many-body theory for systems consisting of composite particles N80-16849
MAPPING
Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types — San Juan Mountains, Colorado
[E80-10041] N80-16301
MAPS
Atlas of Mars: The 1:5000000 map series
[NASA-SP-438] N80-16998
MARINE CHEMISTRY
The influence of differential production and dissolution of the stable isotope composition of Planktonic foraminifera
[PB-299724/5] N80-16705
MARINE ENVIRONMENTS
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, volume 3. Area 17, Tahiti Island and Moorea Island; area 18, Tuamotu Archipelago; area 19, Pitcairn Island; area 20, Easter Island; area 21, Isla San Ambrosio and Isla San Felix; area 22, Islas Juan Fernandez; area 23, Norfolk Island; area 24, Chatham Island
[AD-A073874] N80-16685
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, New Zealand, volume 4. Area 25, Auckland west; area 26, Auckland east; area 27, Cook Strait nw; area 28, Cook Strait; area 29, Hawke Bay; area 30, South Island nw; area 31, Foveaux Strait; area 32, Christchurch
[AD-A073875] N80-16686
MARINE METEOROLOGY
Verification procedures for the SEASAT measurements of the vector wind with the SASS
[NASA-CR-162489] N80-16407
Mariners weather log, volume 23, number 4,
[PB-300277/1] N80-16681
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, volume 3. Area 17, Tahiti Island and Moorea Island; area 18, Tuamotu Archipelago; area 19, Pitcairn Island; area 20, Easter Island; area 21, Isla San Ambrosio and Isla San Felix; area 22, Islas Juan Fernandez; area 23, Norfolk Island; area 24, Chatham Island
[AD-A073874] N80-16685
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, New Zealand, volume 4. Area 25, Auckland west; area 26, Auckland east; area 27, Cook Strait nw; area 28, Cook Strait; area 29, Hawke Bay; area 30, South Island nw; area 31, Foveaux Strait; area 32, Christchurch
[AD-A073875] N80-16686
MARINE RESOURCES
Environmental impact and economic evaluation research needs for coastal and marine resource management
[PB-301208/5] N80-16604
MARKET RESEARCH
Possible markets for dirigibles
[NASA-TM-75937] N80-16042
Solar collector manufacturing activity
[DOE/EIA-0174/78] N80-16500
Advanced electric generation. Commercialization in phase 3 planning
[DOE/ERD-0014] N80-16547
MARS (PLANET)
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars
[NASA-TM-78254] N80-17004
MARS SURFACE
Atlas of Mars: The 1:5000000 map series
[NASA-SP-438] N80-16998
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars
[NASA-TM-78254] N80-17004
MARSHLANDS
A study of highway embankment construction in South Carolina marshlands
[PB-300815/6] N80-16243
MARTENSITIC STAINLESS STEELS
Stress corrosion cracking evaluation of martensitic precipitation hardening stainless steels
[NASA-TM-78257] N80-16142
MARTENSITIC TRANSFORMATION
Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-8346] N80-16157
MARYLAND
Preliminary assessment of the prospects for use of refuse-derived fuel in Maryland
[BNL-51065] N80-16179
MASS FLOW
Dynamics of equatorial mass-flow adjustment
N80-16671
MASS SPECTROSCOPY
Mass spectrometer determination of argon contents in laser fusion target pellets
[UCRL-81416-REV-1] N80-16331

MASS TRANSFER
Mass transfer controlled reactions in packed beds at low Reynolds numbers N80-16112
The reduction of silica and mullite in hydrogen --- kinetics, thermodynamics, and mass transport phenomena N80-16115
Natural convection in a vertical channel with heat and mass transfer and flow reversal N80-16291

MASSACHUSETTS
Inventory of sources with emissions of 25 to 100 tons per year subject to organic material regulations in Metropolitan Boston AQCR
[PB-301242/4] N80-16613

MATERIALS HANDLING
Energy and materials flows in the fabrication of aluminum products
[ANL/CNSV-3] N80-16237

MATERIALS RECOVERY
Refractory particles in cullet recovered from municipal refuse
[PB-300523/8] N80-16597

MATHEMATICAL MODELS
Maximum likelihood identification of aircraft parameters with unsteady aerodynamic modelling N80-16027
Theoretical study of a reaction-diffusion model for flame propagation in a gas
[LBL-9487] N80-16128
Dislocation model for twinning and fracture and its application to HCP metals
[CONF-790801-3] N80-16148
Aggregated vectorial model of petroleum flow in the United States
[LBL-8874] N80-16178
Liquid spring shock isolator modeling by system identification N80-16222
A generalized derivative model for an elastomer damper N80-16223
Shock response of non-linear systems N80-16224
A computational model describing the initiation of silver acetylide-silver nitrate explosive by an intense light source N80-16228
Investigation of the nonlinear characteristics of a three story steel frame using system
[PB-301363/8] N80-16253
Numerical solution of three-dimensional natural convection by the strongly implicit procedure
[DP-MS-78-14] N80-16310
Nonorthogonal measurement axes in laser Doppler velocimetry
[AD-A073700] N80-16323
Efficient procedure for selecting among five reliability models
[ORNL/CSD-43] N80-16362
Effects of cracks on the response of shell structures --- mathematical model
[CONF-790802-57] N80-16384
Flow routing in the Susquehanna River basin. Part 2: Low-flow frequency characteristics of the Susquehanna River between Waverly, New York and Sunbury, Pennsylvania
[PB-301392/7] N80-16414
Flow routing in the Susquehanna River Basin. Part 3: Routing reservoir releases in the Tioga and Chemung Rivers System, Pennsylvania and New York
[PB-301393/5] N80-16415
Regional stochastic generation of streamflows using an ARIMA (1,0,1) process and disaggregation
[PB-300945/3] N80-16431
A mathematical model of stratified, bidirectional flow in short culverts
[PB-300494/2] N80-16434
A mathematical hydrodynamic circulation model of Great Salt Lake for resource management
[PB-299013/3] N80-16436
Evaluation of a digital model for estuarine water quality simulation in waste allocation studies --- Florida Gulf Coast
[PB-298820/2] N80-16437
Aquifer modeling by numerical methods applied to an Arizona groundwater basin
[PB-298962/2] N80-16439
Independent assessment of energy policy models
[EPRI-EA-1071] N80-16510
Factors affecting potential market penetration of laser fusion power plants
[PNL-2803] N80-16552
A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 1: Model formulation
[PB-300470/2] N80-16585
A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 2: User's manual
[PB-300471/9] N80-16586
The maximum likelihood approach to probabilistic modeling of air quality data
[PB80-104110] N80-16609
Earthquake waves in a random medium --- analyzed using mathematical models
[PB80-104862] N80-16662
ARMA models for earthquake ground motions
[PB-301166/5] N80-16667
Coastal upwelling ecosystems analysis. Interactions of primary nutrient and carbon uptake in the Peru current: A review and synthesis of laboratory and field results
[PB-301031/1] N80-16708
A numerical investigation of the Bering Sea circulation using a linear homogeneous model
[PB-299884/7] N80-16711
Planar biped dynamics and control N80-16736
Performance prediction of computer architectures operating on linear mathematical models
[UCRL-52582] N80-16746
Circular balanced repeated measurements design
[AD-A074234] N80-16825
Approximation methods for the partition functions of anharmonic systems
[COO-3127-30-T1] N80-16857
Multiquark mesons revisited
[ORO-3992-344] N80-16870
The annihilation model of the Tormac sheath N80-16879
Aspects of Tokamak toroidal magnet protection
[COO-2431-6] N80-16900
Mathematical modeling and experimental studies of thermal reactions of coal --- mathematical model of coal pyrolysis N80-16925
Scientific management of the repairable item inventory system
[AD-A074259] N80-16933
The interaction between urbanization and land quality and quantity in environmental planning and design. The housing model technical documentation
[PB-301111/1] N80-16953

MATHEMATICAL PROGRAMMING
Symbolic Factorable SUMT: What is it, how is it used
[AD-A074903] N80-16769
Network flows, volume 2. A bibliography with abstracts
[NTIS/PS-79/1078/9] N80-16826
Network flows, volume 1. A bibliography with abstracts
[NTIS/PS-79/1077/1] N80-16827

MATRICES (MATHEMATICS)
Vectorized sparse examination
[AD-A074091] N80-16808

MATRIX THEORY
On Q-matrices, centroids and simplotopes
[AD-A074959] N80-16803

MAXIMUM LIKELIHOOD ESTIMATES
Maximum likelihood identification of aircraft parameters with unsteady aerodynamic modelling N80-16027
A maximum likehood estimator for an exponential parameter from a life test with both type 1 and type 2 censoring
[AD-A073895] N80-16358
The maximum likelihood approach to probabilistic modeling of air quality data
[PB80-104110] N80-16609

MAXIMUM USABLE FREQUENCY
Ionospheric storm effects on maximum usable frequencies on circuits around Australia
[IPS-R-35] N80-16647

MAXWELL-BOLTZMANN DENSITY FUNCTION
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 2: The effect of non-Maxwellian electron distribution functions on ionization equilibrium calculations for carbon, nitrogen and oxygen
[NASA-CR-162695] N80-16852

MEAN
On the uniformly minimum variance unbiased estimators of the variance and its reciprocal of an inverse Gaussian distribution
[AD-A074090] N80-16819

MEASURE AND INTEGRATION
Baseline correction of earthquake records in the frequency domain
[PB80-102056] N80-16659
Circular balanced repeated measurements design
[AD-A074234] N80-16825
Time integrating optical signal processing N80-16875

MEASURING INSTRUMENTS
Polyurethane foam, 0.05 g/cm3 density
[BDX-613-1964-REV] N80-16170
Faraday rotation measurement method and apparatus --- to receive RF signals from spacecraft which exhibits polarization characteristics due to spin stabilization
[NASA-CASE-NPO-14839-1] N80-16313
Preliminary evaluation of commercial continuous instrumentation for the measurement of viscosity and coal concentration of Coal-Oil Mixtures (COM)
[HCP/T2463-03] N80-16315
Interaction between classical and quantum systems: A new approach to quantum measurement. 2: Theoretical considerations
[ORO-3992-342] N80-16930
Interaction between classical and quantum systems: A new approach to quantum measurement. 3: Illustration
[ORO-3992-343] N80-16931

MECHANICAL ENGINEERING
Information approach to parts mating --- for use on assembly systems for industrial engineering and product engineering
[PB-300519/6] N80-16352
An experiment in synopsis publishing in the field of mechanical engineering
[BLL-BLRDR-5498] N80-16945

MECHANICAL IMPEDANCE
The Shock and Vibration Bulletin. Part 2: Modal and impedance analysis, human response to vibration and shock, isolation and damping, dynamic analysis
[NASA-CR-162472] N80-16211
An impedance technique for determining low frequency payload environments --- Space Transportation System N80-16212

MECHANICAL PROPERTIES
Composite materials research and education program: The NASA-Virginia Tech composites program
[NASA-CR-162719] N80-16101
Influence of heat treatment on the microstructure and mechanical properties of Alloy 718 base metal and weldments
[HEDL-TME-78-54] N80-16156
An optical investigation of the correlation between mass transport and mechanical properties of strained polymer films N80-16161
Characterization of halthane polyurethane adhesives. 1: Dynamic mechanical and thermal properties
[UCRL-82694] N80-16171
Influences of the couple-stresses on the pure-bending of a circular cylinder
[GA-A-15141] N80-16385
The use of wood for wind turbine blade construction N80-16474

MECHANICAL SHOCK
High G pyrotechnic shock simulation using metal-to-metal impact N80-16206

MEDICAL EQUIPMENT
Physical testing of polymers for use in circulatory assist devices
[PB80-101546] N80-16740

MEMBRANE STRUCTURES
Development of dry process microporous polysulfone supports for ultrathin film composites
[PB-300488/4] N80-16133
Strong thin membrane structure --- solar sails
[NASA-CASE-NPO-14021-2] N80-16163

MENTAL PERFORMANCE
Multi-modal information processing for visual workload relief
[NASA-CR-162720] N80-16737

MERIDIONAL FLOW
Eddyless channel flows and their stability
[PB80-104649] N80-16427

MESOMETEOROLOGY
Mesoscale characteristics of the Texas hiplex area during summer 1977
[PB-298963/0] N80-16697
MESONS
Multiquark mesons revisited
[ORO-3992-344] N80-16870
MESOSCALE PHENOMENA
Mesoscale characteristics of the Texas hiplex area during summer 1977
[PB-298963/0] N80-16697
METABOLISM
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16706
METAL COMBUSTION
Titanium combustion in turbine engines
[AD-A075657] N80-16059
METAL FOILS
Irradiation damage in metals produced by 800-MeV protons
[LA-7939-MS] N80-16145
METAL FUELS
High-temperature thermodynamic properties of the thorium-oxygen system
[CONF-790761-1] N80-16927
METAL IONS
Aluminum ion-containing polyimide adhesives --- bonding temperature resistant materials
[NASA-CASE-LAR-12640-1] N80-16164
METAL OXIDE SEMICONDUCTORS
Surface defects in weakly deformed single crystal silicon and their effect on interface properties of MOS capacitors N80-16913
METAL SURFACES
Tribological properties of silicon carbide in metal removal process
[NASA-TM-79238] N80-16340
Low energy electron vibrational excitation of molecules adsorbed on surfaces: Experiment and theory N80-16842
METALLIZING
Improving the voltage holdoff performance of alumina insulators in vacuum through quasimetallizing
[GEPP-TIS-441] N80-16285
METALS
Conversion of isotope compounds to metal by reduction-distillation methods
[CONF-780943-2] N80-16125
The effects of strain rate and strain history on the dynamic behavior of metallic materials N80-16140
An analysis of the factors affecting the distribution of heavy metals in a tidal estuary N80-16573
METAMORPHISM (GEOLOGY)
Geology of precambrian metamorphic rocks of the Truchas Peaks area, north-central New Mexico N80-16626
METEORITIC COMPOSITION
Noble-gas-rich separates from ordinary chondrites N80-17000
METEOROLOGICAL CHARTS
Recent rain measurement maps of Belgium N80-16680
METEOROLOGICAL PARAMETERS
The weather in 1978 N80-16679
Results of the August 1977 Soviet and American meterological rocketsonde intercomparison held at Wallops Island, Virginia
[NASA-RP-1053] N80-16682
AVE-SESAME 1: 25-MB sounding data
[NASA-TM-78256] N80-16683
The 19304DT GSRS, missile number 1030, round number V-55, 12 July 1979
[AD-A074962] N80-16687
The 19304DT GSRS missile number 1066, round number V-56 --- meteorological and weather data on a missile range
[AD-A074965] N80-16688
The 19304DT GSRS missile number 1035, round number V-57 --- weather and meteorological parameters for the missile range
[AD-A074980] N80-16689
The 1930 GSRS, missile numbers 1115, 1116, 1117, round numbers V-58, V-59, V-60, 30 July 1979
[AD-A074981] N80-16690
The 19702A GSRS, missile number 340, round number B-27, 6 August 1979
[AD-A074982] N80-16691
The 19702A GSRS, missile number 303, round number B-28, 6 August 1979 --- weather and meteorological parameters recorded on the missile range
[AD-A074983] N80-16692
Meteorological Effects of Thermal Energy Releases (METER) program
[ORNL/TM-6867] N80-16693
METHANE
Autohydrolysis for improving methane yield from fermentation of lignocellulose N80-16175
Unconventional gas recovery program
[METC/SP-79/8] N80-16181
Flash hydropyrolysis of coal
[BNL-51010] N80-16185
Summary of aircraft results for 1978 southeastern Virginia urban plume measurement study of ozone, nitrogen oxides, and methane
[NASA-TM-80146] N80-16575
METHYL ALCOHOLS
Conceptual design of a coal-to-methanol-to-gasoline commercial plant: Executive summary
[FE-2416-43] N80-16182
A twin optically-pumped far-infrared CH3OH laser for plasma diagnostics --- Tokamak devices
[IPPJ-428] N80-16882
METRIC SPACE
Metric-connection theories of gravity --- particle spin N80-16643
MICHIGAN
Coping with energy limitations in transportation: Proposals for Michigan
[PB-299737/7] N80-16559
Factors influencing specific growth rates and seasonal abundance of eutrophic lake phytoplankton N80-16716
MICROCOMPUTERS
Microcomputer-based CNC 600 numerical control system described N80-17018
Interface assembly for use in K 1520 system described N80-17019
Microcomputer system K 1520 examined N80-17020
MICROELECTRONICS
East Europe report: Scientific affairs, no. 659
[JPRS-74911] N80-17015
Devices for manufacture of microstructures, chips described N80-17017
Microcomputer-based CNC 600 numerical control system described N80-17018
Microcomputer system K 1520 examined N80-17020
MICROPROCESSORS
A statistical analysis for digital field strength data
[BBC-RD-1979/24] N80-16276
Wizard: A string-oriented microprocessor operating system
[AD-A074704] N80-16744
Wizard programmer manual
[AD-A074526] N80-16745
MICROSTRUCTURE
Influence of heat treatment on the microstructure and mechanical properties of Alloy 718 base metal and weldments
[HEDL-TME-78-54] N80-16156
MICROWAVE EQUIPMENT
Rapid-scanning measurements of wind-produced doppler on an asymmetrical microwave transhorizon propagation path N80-16674
MICROWAVE FREQUENCIES
Investigation of digital microwave communications in a strong meteorological ducting environment
[PB-301212/7] N80-16269
The dielectric properties of soil-water mixtures at microwave frequencies
[NASA-TM-80597] N80-16403
MICROWAVE RADIOMETERS
A spectral filter for ESMR's sidelobe errors
[NASA-TM-80555] N80-16402
MILKY WAY GALAXY
Kinematics of H1 near the galactic center N80-16993
MINERAL DEPOSITS
Application of plate tectonics to the location of new mineral targets in the Appalachians
[PB-300512/1] N80-16442
Preliminary geologic appraisal and economic aspects of the Precambrian basement of Iowa N80-16633
Geology and skarn ore mineralization of the Yeonhwa-Ulchin zinc-lead mining district, southeastern Taebaegsan region, Korea N80-16634
MINERALS
Physics of mantle and core minerals --- Hugoniot data N80-16636
MINES (EXCAVATIONS)
Environmental development plan: Underground coal gasification
[DOE/EDP-0047] N80-16411
Sideboard device for improved face ventilation in coal mines
[PB-300365/4] N80-16443
Radiant heating of mine bulkheads
[PB-300363/9] N80-16444
Improved light scattering dust monitor
[PB-299938/1] N80-16445
Evaluation of the environmental effects of western surface coal mining. Volume 2: Mine inventory
[PB-301249/9] N80-16621
MINICOMPUTERS
Continuing regional solar energy information mini-center activities and updating the SOLCOST program
[COO-4643-T2] N80-16521
Linking of the mini-computer Electronik-100I and NR-9821A
[NASA-TM-75670] N80-16743
Minicomputer-base interactive image processing
[LA-UR-79-1912] N80-16779
MINIMA
Catalog of two-dimensional vortex patterns --- free energy minima
[LA-7384-MS] N80-16309
MINIMAX TECHNIQUE
Probability and statistics and applications
[AD-A074257] N80-16821
MINING
Strip coal mining and mined-land reclamation in the hydrologic system, southeastern Montana
[PB-301253/1] N80-16441
Environmental assessment of surface mining methods: Head-of-hollow fill and mountaintop removal
[PB-300540/2] N80-16622
An assessment of the effects of bathymetric changes associated with sand and gravel mining on tidal circulation in the lower bay of New York Harbor
[PB80-106487] N80-16703
MINNESOTA
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400
MIS (SEMICONDUCTORS)
The interface state effects and characterization of MIS solar cells --- describing the charge carrier mechanisms and electron tunneling behavior N80-16451
MISSILE CONTROL
Dynamic analysis of beam-rider missile performance
[TAE-376] N80-16085
Output ensemble average of periodically excited linear time-varying systems --- applicable to a missile intercept problem
[TAE-372] N80-16798
MISSILE RANGES
The 19304DT GSRS, missile number 1030, round number V-55, 12 July 1979
[AD-A074962] N80-16687
The 19304DT GSRS missile number 1066, round number V-56 --- meteorological and weather data on a missile range
[AD-A074965] N80-16688
The 19304DT GSRS missile number 1035, round number V-57 --- weather and meteorological parameters for the missile range
[AD-A074980] N80-16689
The 1930 GSRS, missile numbers 1115, 1116, 1117, round numbers V-58, V-59, V-60, 30 July 1979
[AD-A074981] N80-16690
The 19702A GSRS, missile number 340, round number B-27, 6 August 1979
[AD-A074982] N80-16691
The 19702A GSRS, missile number 303, round number B-28, 6 August 1979 --- weather and meteorological parameters recorded on the missile range
[AD-A074983] N80-16692

MISSILE TESTS
The 1930 GSRS, missile numbers 1115, 1116, 1117, round numbers V-58, V-59, V-60, 30 July 1979
[AD-A074961] N80-16690
The 19702A GSRS, missile number 340, round number B-27, 6 August 1979
[AD-A074962] N80-16691
MISSILE TRAJECTORIES
Dynamic analysis of beam-rider missile performance
[TAE-376] N80-16085
MISSION PLANNING
Mission operation report. Solar Maximum Mission (SMM)
[NASA-TM-80939] N80-16072
Evaluation of use of MPAD trajectory tape and number of orbit points for orbiter mission thermal predictions
[NASA-TM-80946] N80-16081
Electric propulsion for near-Earth space missions
[NASA-CR-159735] N80-16096
Characteristics of the telescope for high energy gamma-ray astronomy selected for definition studies on the gamma ray observatory
[NASA-TM-80590] N80-16987
MISSISSIPPI
Transportation needs for the elderly, handicapped and low income of Mississippi
[PB-301273/9] N80-16971
MIXED CRYSTALS
Picosecond dynamics of energy transfer in pure and mixed organic crystals N80-16901
MIXERS
Polyurethane foam, 0.05 g/cm3 density
[BDX-613-1964-REV] N80-16170
MIXING
A simulation model of estuarine subsystem coupling and carbon exchange with the sea N80-16699
MIXTURES
The dielectric properties of soil-water mixtures at microwave frequencies
[NASA-TM-80597] N80-16403
MODAL RESPONSE
The Shock and Vibration Bulletin. Part 2: Modal and impedance analysis, human response to vibration and shock, isolation and damping, dynamic analysis
[NASA-CR-162472] N80-16211
A statistical look at modal displacement response to sequential excitations --- vibratory pointing error N80-16213
On determining the number of dominant modes in sinusoidal structural response N80-16214
MODULUS OF ELASTICITY
Variable modulus model for inelastic finite element analysis N80-16196
MOLECULAR ABSORPTION
Treatment of molecular absorption by use of transmission average opacities in cool stellar atmosphere models N80-16996
MOLECULAR BEAMS
Photodissociation processes in molecular beams N80-16845
Interactions of molecular and ion beams with surfaces --- bibliographies
[AD-A073278] N80-16853
MOLECULAR BIOLOGY
Physio-chemical investigation of some areas of fundamental significance to biophysics
[ORO-3018-T1] N80-16721
MOLECULAR COLLISIONS
Coherence effects in heavy ion-atom collisions
[CONF-780936-1] N80-16860
MOLECULAR EXCITATION
Studies of atoms and molecules using multiphoton absorption of ultraviolet laser radiation N80-16844
Double resonance spectroscopy of multiple-photon excited molecules
[COO-2793-15] N80-16858
MOLECULAR INTERACTIONS
Interactions of molecules with surfaces
[COO-4974-1] N80-16861
MOLECULAR SPECTROSCOPY
High resolution saturation spectroscopy with CO2 lasers. Application to the nu sub 3 bands of SF6 and OsO4
[LA-UR-79-1913] N80-16123
MOLECULAR STRUCTURE
Thermal stability of isocyanate based polymers N80-16162
Selected topics on the electronic structure of small molecules N80-16843
Molecular thermodynamics of dew-point calculations in coal gasification processes N80-16926
MOLECULES
Selected topics on the electronic structure of small molecules N80-16843
MOLYBDENUM
The effects of interstitial impurities radiation temperature on voids swelling and irradiation hardening in the neutron irradiated molybdenum N80-16139
MOMENT DISTRIBUTION
Aerodynamic coefficient estimation by means of an extended Kalman filter --- to study dynamic models of reentry vehicle motion
[SAND-79-0411C] N80-16039
MOMENTS
Computing region moments from boundary representations
[NASA-CR-162685] N80-16767
MONATOMIC GASES
Light scattering studies of solids and atomic vapors
[LBL-8222] N80-16173
MONOMERS
Manufacturing processes for fabricating graphite/PMR 15 polyimide structural elements
[NASA-CR-159129] N80-16105
MONTANA
Strip coal mining and mined-land reclamation in the hydrologic system, southeastern Montana
[PB-301253/1] N80-16441
MOSAICS
Atlas of Mars: The 1:5000000 map series
[NASA-SP-438] N80-16998
MOSSBAUER EFFECT
Mossbauer measurements on low temperature deuteron implanted Al(Co57) N80-16906
MOTION SIMULATORS
Feasibility and concept study to convert the NASA/AMES vertical motion simulator to a helicopter simulator
[NASA-CR-152193] N80-16070
MOUNTAINS
Stratigraphy and sedimentology of the Upper Devonian Catskill and Uppermost Trimmers Rock formations in central Pennsylvania N80-16629
MULTICHANNEL COMMUNICATION
On the effect of redundancy on the multiple access broadcast channel
[AD-A073579] N80-16265
MULTIPLE ACCESS
On the effect of redundancy on the multiple access broadcast channel
[AD-A073579] N80-16265
MULTIPLICATION
Classes of non-commutative rings with dedekind domain-like properties and module over non-commutative valuation rings N80-16790
MULTISPECTRAL PHOTOGRAPHY
Synthetic aperture radar/LANDSAT MSS image registration
[NASA-RP-1039] N80-16405
Processing of multispectral thermal IR data for geologic applications
[NASA-CR-162682] N80-16651
MULTIVARIATE STATISTICAL ANALYSIS
Optimal information acquisition for randomly occurring decisions
[AD-A074956] N80-16804
Probability and statistics and applications
[AD-A074257] N80-16821
MYLAR (TRADEMARK)
Increased fracture toughness of graphite-epoxy composites through intermittent interlaminar bonding --- Mylar interlayer
[NASA-CR-159198] N80-16106
MYOCARDIUM
Catecholamines and myocardial contractile function during hypodynamia and with an altered thyroid hormone balance
[NASA-TM-76000] N80-16720

N

NASA PROGRAMS
Mission operation report. Solar Maximum Mission (SMM)
[NASA-TM-80939] N80-16072
Potential utilization of the NASA/George C. Marshall Space Flight Center in earthquake engineering research
[NASA-CR-161371] N80-16650
Department of Housing and Urban Development, and certain independent agencies appropriations for fiscal year 1980, part 1
[GPO-41-318] N80-16949
Space benefits: The secondary application of aerospace technology in other sectors of the economy
[NASA-CR-162697] N80-16950
NATIONAL AIRSPACE UTILIZATION SYSTEM
Report of the FAA task force on aircraft separation assurance. Volume 1: Executive summary
[AD-A075352] N80-16050
NATURAL GAS
Oil and gas replacement cost: Development and production. Volume 1: Discussion of methodology, exhibits, and projections
[DOE/TIC-10078] N80-16187
Gas production of Devonian shale wells relative to photo lineament locations: A statistical analysis
[METC/CR-79/28] N80-16410
Subsurface stratigraphy of the Middle and Upper Devonian clastic sequence in southern West Virginia and its relation to gas production N80-16628
NAVIER-STOKES EQUATION
Analytical and design techniques for drag reduction studies on wavy surfaces --- Navier-Stokes equation
[NASA-CR-3225] N80-16297
Boundary conditions for flow computation with nonorthogonal curvilinear coordinates
[KAPL-4123] N80-16304
NAVIGATION AIDS
Results of a Loran-C flight test using an absolute data reference
[NASA-CR-162751] N80-16051
NETWORK ANALYSIS
On Q-matrices, centroids and simplotopes
[AD-A074959] N80-16803
Fast algorithms for solving path problems
[AD-A074079] N80-16806
Network flows, volume 2. A bibliography with abstracts
[NTIS/PS-79/1078/9] N80-16826
Network flows, volume 1. A bibliography with abstracts
[NTIS/PS-79/1077/1] N80-16827
NETWORK SYNTHESIS
Investigation of requirements and implementation of facilities for connecting UK hosts to Euronet
[BLL-BLRDR-5508] N80-16788
Estimation of random fields from network observations
[COO-2874-54] N80-16811
NEUTRAL PARTICLES
The production of neutrinos and neutrino-like particles in proton-nucleus interactions N80-16847
NEUTRINOS
The production of neutrinos and neutrino-like particles in proton-nucleus interactions N80-16847
NEUTRON SCATTERING
Equilibrium properties of the fluxoid lattice in single-crystal niobium
[CONF-790653-2] N80-16920
NEUTRONS
The effects of interstitial impurities radiation temperature on voids swelling and irradiation hardening in the neutron irradiated molybdenum N80-16139
NEVADA
Determination of astronomic positions for California-Nevada boundary monuments near Lake Tahoe
[PB-301264/8] N80-16664
NEW JERSEY
An analysis of the factors affecting the distribution of heavy metals in a tidal estuary N80-16573
NEW MEXICO
Test results of the DOE/Sandia 17 meter VAWT N80-16465
Blade design and operating experience on the MOD-OA 200 kW wind turbine at Clayton, New Mexico N80-16470
Evaluation of an operating MOD-OA 200 kW wind turbine blade N80-16471
Environmental system study on the development of fossil fuel resources in the Southwest
[PB-300526/1] N80-16596

Geology of precambrian metamorphic rocks of the Truchas Peaks area, north-central New Mexico
N80-16526
Bibliography of geology and hydrology, eastern New Mexico
[PB-300832/3] N80-16663
The 1930 GSRS, missile numbers 1115, 1116, 1117, round numbers V-58, V-59, V-60, 30 July 1979
[AD-A074981] N80-16690
The 19702A GSRS, missile number 340, round number B-27, 6 August 1979
[AD-A074982] N80-16691

NEW YORK
Textural properties of surficial sediments of lower bay of New York harbor
[PB80-106479] N80-16592
The lower bay complex
[PB80-106990] N80-16594
An assessment of the effects of bathymetric changes associated with sand and gravel mining on tidal circulation in the lower bay of New York Harbor
[PB80-106487] N80-16703

NEWS MEDIA
The presentation of science by the media
[BLL-BLRDR-5494] N80-16943

NICKEL
Corrosion behavior of Ni implanted steel
N80-16136

NICKEL ALLOYS
Long-life fatigue test results for two nickel-base structural alloys
[KAPL-4105] N80-16150
Effect of heat treatment on the elevated temperature tensile and fracture toughness response of Alloy 718
[HEDL-TME-78-98] N80-16151

NICKEL CADMIUM BATTERIES
Sealed-cell nickel-cadmium battery applications manual
[NASA-RP-1052] N80-16095

NICKEL COMPOUNDS
Magnetic properties of selected transition metal compounds N80-16136

NIMBUS 5 SATELLITE
A spectral filter for ESMR's sidelobe errors
[NASA-TM-80555] N80-16402

NIMBUS 6 SATELLITE
A case study of height and temperature analyses derived from Nimbus-6 satellite soundings on a fine mesh model grid N80-16642

NIOBIUM
Structural properties of NB3SN diffusion layers fabricated on single crystal Nb substrates
[AD-A074739] N80-16915
Equilibrium properties of the fluxoid lattice in single-crystal niobium
[CONF-790653-2] N80-16920

NITRATES
Coastal upwelling ecosystems analysis. Nitrate reductase activity in the North West African upwelling area
[PB-301030/3] N80-16707

NITRIDES
Electrochemistry of acetylides, nitrides and carbon cathodes in molten halides
[COO-4445-T1] N80-16121

NITROGEN
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 2: The effect of non-Maxwellian electron distribution functions on ionization equilibrium calculations for carbon, nitrogen and oxygen
[NASA-CR-162695] N80-16852

NITROGEN DIOXIDE
Nitrogen dioxide vapor penetration of chlorobutyl rubber SCAPE under operational conditions
[NASA-TP-1605] N80-16118
An analysis of alternative policies for attaining and maintaining a short-term NO2 standard
[PB80-100530] N80-16608

NITROGEN OXIDES
Summary of aircraft results for 1978 southeastern Virginia urban plume measurement study of ozone, nitrogen oxides, and methane
[NASA-TM-80146] N80-16575
Environmental assessment of stationary source NOx control technologies
[PB-300469/4] N80-16601

NODES (STANDING WAVES)
The enhanced nodal equilibrium ocean tide and polar motion
[NASA-TM-80592] N80-16700

NOISE INTENSITY
The development of a method for predicting the noise exposure of payloads in the space shuttle orbiter vehicle N80-16199

NOISE MEASUREMENT
Status of cavity noise phenomena measurement and suppression on the B-1 aircraft N80-16202

NOISE PROPAGATION
Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159598] N80-16061
Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159749] N80-16062

NOISE REDUCTION
Ground run-up noise control facilities for civil aircraft: A survey
[AD-A075348] N80-16067
Status of cavity noise phenomena measurement and suppression on the B-1 aircraft N80-16202
Method of assessing the impact of metallurgical noise and its reduction in ultrasonic testing of austenitic welds
[GEFR-SP-164] N80-16349
Estimation of noise shielding by barriers
[ESDU-79011] N80-16835
Experimental evaluation of active and passive means of alleviating rotor impulsive noise in descent flight
[NASA-CR-159188] N80-16839

NOISE TOLERANCE
Research plan for establishing the effects of time varying noise exposures on community annoyance and acceptability
[NASA-CR-159197] N80-16577

NONDESTRUCTIVE TESTS
Semiconductor measurement technology: Nondestructive tests used to insure the integrity of semiconductor devices, with emphasis on acoustic emission techniques
[PB80-101801] N80-16287
The development of quantitative NDI for retirement-for-cause
[AD-A066403] N80-16355
Acoustoelastic analysis of center-cracked panels
N80-16357
Initial imperfection measurements of integrally Stringer-stiffened cylindrical shells
[TAE-330] N80-16374

NONLINEAR EQUATIONS
Generalized Adams methods --- for underwater acoustic wave propagation problem
[AD-A074548] N80-16801

NONLINEAR SYSTEMS
Shock response of non-linear systems
N80-16224
Stability analysis and response characteristics of two-degree of freedom nonlinear systems
N80-16225
Symbolic Factorable SUMT: What is it, how is it used
[AD-A074903] N80-16769
Linear and nonlinear stochastic operators
N80-16813

NONLINEARITY
Application of the finite element method to the nonlinear inverse heat conduction problem using Beck's second method
[K/CSD/INF-78/20] N80-16308
The Dirichlet problem for quasilinear elliptic equations with lower regularity at the boundary
N80-16792

NONPARAMETRIC STATISTICS
Consistent nonparametric estimation of best linear classification rules/solving inconsistent systems of linear inequalities N80-16797

NONUNIFORM MAGNETIC FIELDS
Drag force on a conductive spherical drop in a nonuniform magnetic field
[ORNL/TM-6976] N80-16830

NONUNIFORMITY
Structure inelasticity 24. Examples of non-uniqueness in contained plastic deformation
[AD-A074727] N80-16350

NORMAL DENSITY FUNCTIONS
Asymptotic normality of a variance estimator of a linear combination of a function of order statistics
[AD-A074846] N80-16805
On the uniformly minimum variance unbiased estimators of the variance and its reciprocal of an inverse Gaussian distribution
[AD-A074090] N80-16819

NORMALITY
Tests for normality and symmetry N80-16816

NORTH DAKOTA
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400

NOTCH SENSITIVITY
Elastic stress concentration factors: Rectangular notch in the edge of a wide flat plate in tension
[ESDU-79008] N80-16372

NOVAE
Helium runaways in white dwarfs
[NASA-CR-162694] N80-16986

NUCLEAR FUELS
Hydrogen pellet fueling experiment on the ISX-A Tokamak
[ORNL/TM-6496] N80-16892

NUCLEAR FUSION
Direct energy conversion systems
[COO-2218-117] N80-16543
Fusion: The power sources of the future inertial confinement option
[UCRL-82768] N80-16866
Confirmatory analysis and detail design of the magnet system for Mirror Fusion Test Facility (MFTF)
[UCRL-13923] N80-16893
Systems-design and energy-balance considerations for impact fusion
[LA-UR-79-1969] N80-16899

NUCLEAR INTERACTIONS
The temperature and density dependence of the nuclear spin-spin interaction in HD gas and fluid
N80-16846

NUCLEAR PHYSICS
Research program in theoretical high-energy physics
[COO-3130TA] N80-16869

NUCLEAR POWER PLANTS
Factors affecting potential market penetration of laser fusion power plants
[PNL-2803] N80-16552
Meteorological Effects of Thermal Energy Releases (METER) program
[ORNL/TM-6867] N80-16693
Low-level radioactive waste management. Volume 2: Forecast of low-level radwaste management requirements
[PB80-105059] N80-16873

NUCLEAR QUADRUPOLE RESONANCE
Resonances in nuclear physics --- in light of S matrix theory N80-16864

NUCLEAR SCATTERING
Resonances in nuclear physics --- in light of S matrix theory N80-16864

NUCLEI (NUCLEAR PHYSICS)
Energy spectra of cosmic ray nuclei to above 100 GeV/nucleon --- measurement of energy spectra of cosmic ray nuclei boron to iron
[NASA-TM-80587] N80-17011

NUCLEONICS
Independent particle aspects of nuclear dynamics --- particle motion of nucleons N80-16863

NUCLEONS
Independent particle aspects of nuclear dynamics --- particle motion of nucleons N80-16863

NUMERICAL ANALYSIS
Prediction of fragment velocities and trajectories
N80-16210
Design of disc cams with translating roller followers: Calculation methods
[ESDU-79007] N80-16335
Analysis of numerical ionograms. 3: The valley program
[IPS-X8] N80-16648
Computational methods of system identification and parameter estimation N80-16761
Symbolic-numeric interface: A review
[NASA-CR-162690] N80-16768

The 1979 SIGNUM meeting on Numerical Ordinary Differential equations
[COO-2383-0058] N80-16810

NUMERICAL CONTROL
Microcomputer-based CNC 600 numerical control system described N80-17018

NUMERICAL WEATHER FORECASTING
A comparison of GLAS SAT and NMC high resolution NOSAT forecasts from 19 and 11 February 1976
[NASA-TM-80591] N80-16678
Prospects for monthly forecasts with 3-D global weather models
[UCRL-82548] N80-16694

NUTATION
Long term variation of asteroid nutation N80-16981

O

OCEAN BOTTOM
South Atlantic outer continental shelf geological studies, FY 1976
[PB-300822/4] N80-16701
South Atlantic outer continental shelf geological studies, FY 1976 --- sediment transport over the south Atlantic ocean bottom
[PB-300820/8] N80-16702
An examination of coupled mode theory as applied to underwater sound propagation N80-16832
Sediment characteristics of the 2800 meter Atlantic nuclear waste disposal site: Radionuclide retention potential
[PB-301255/6] N80-16871

OCEAN CURRENTS
A steady thermohaline convection model (driven by turbulent buoyant plumes from multiple isolated sources in a large nonturbulent finite region, with applications to the oceanic thermohaline circulation) N80-16698
Poleward heat flux and conversion of available potential energy in Drake passage
[PB-301311/7] N80-16712

OCEAN MODELS
A steady thermohaline convection model (driven by turbulent buoyant plumes from multiple isolated sources in a large nonturbulent finite region, with applications to the oceanic thermohaline circulation) N80-16698

OCEAN SURFACE
The enhanced nodal equilibrium ocean tide and polar motion
[NASA-TM-80592] N80-16700

OCEAN THERMAL ENERGY CONVERSION
OTEC performance tests of the Union Carbide enhanced-tube condenser
[ANL/OTEC-PS-2] N80-16523

OCEANOGRAPHIC PARAMETERS
Temperature sections along the C-line over the shelf of Cabo Nazca, Peru from moored current meters, 18 March-10 May 1977 and CTD observations, 5 March-15 May 1977
[PB-301101/2] N80-16713

OCEANOGRAPHY
Verification procedures for the SEASAT measurements of the vector wind with the SASS
[NASA-CR-162469] N80-16407

OFFSHORE ENERGY SOURCES
Outer continental shelf environment monitoring concerns
[PB-299861/5] N80-16625

OGO-5
Study of energetic electrons in the outer radiation-belt regions using data obtained by the LLL spectrometer on OGO-5 in 1968
[UCRL-52807] N80-17013

OIL EXPLORATION
Oil and gas replacement cost: Development and production. Volume 1: Discussion of methodology, exhibits, and projections
[DOE/TIC-10078] N80-16187

OIL RECOVERY
Petroleum production at maximum efficient rate, Naval Petroleum Reserve no. 1 (Elk Hills), Kern County, California
[DOE/EIS-0012] N80-16581

OIL SLICKS
Design, fabrication and testing of the air-jet oil boom
[PB80-102635] N80-16593

ON-LINE PROGRAMMING
On-line programmer's management system
[AD-A074468] N80-16774
On-line programmer's management system. Addendum 1: User's guide to the JOVIAL debugger
[AD-A074495] N80-16775
On-line programmer's management system. Addendum 2: Programmer's guide to the debugger
[AD-A074496] N80-16776
Facsimile techniques for on-line computer networks
[BLL-BLRDR-5506] N80-16789

OPACITY
Treatment of molecular absorption by use of transmission average opacities in cool stellar atmosphere models N80-16996

OPEN CHANNEL FLOW
A mathematical model of stratified, bidirectional flow in short culverts
[PB-300494/2] N80-16434

OPENINGS
Fastener hole quality, volume 2
[AD-A074730] N80-16378

OPERATING SYSTEMS (COMPUTERS)
Wizard: A string-oriented microprocessor operating system
[AD-A074704] N80-16744
Wizard programmer manual
[AD-A074528] N80-16745

OPERATIONS RESEARCH
A standard procedure for cost analysis of pollution control operations. Volume 1: User guide
[PB80-108038] N80-16619

OPERATORS (MATHEMATICS)
Transformational structure of algebraic logics N80-16793

OPERATORS (PERSONNEL)
Whole-body vibration of heavy equipment operators N80-16216

OPTICAL COMMUNICATION
Time integrating optical signal processing N80-16875

OPTICAL MEASURING INSTRUMENTS
Optical sieve comparator development project
[PB-300472/8] N80-16317
Attitude characteristics of selected air quality analyzers
[NASA-CR-159165] N80-16578
Design of a reflection on apparatus for laser beam profile measurements
[PB80-101256] N80-16877
Carl Zeiss Jena production of optical precision instruments described N80-17016

OPTICAL PROPERTIES
Radiative transfer modeling applied to sea water constituent determination --- Gulf of Mexico
[NASA-TM-72736] N80-16406
Preliminary experimental results on the optical properties of model direct solar gain interiors
[ISM-233] N80-16519

OPTICAL RADAR
Remote sensing for diagnosing vapor dispersion in spills of liquid energy fuels
[UCID-18237] N80-16408

OPTICAL REFLECTION
Design of a reflection on apparatus for laser beam profile measurements
[PB80-101256] N80-16877

OPTIMAL CONTROL
Active optimal control for suppression of whirl of a flexible centrifuge N80-16336

OPTIMIZATION
Application of numerical optimization to the design of wings with specified pressure distributions
[NASA-CR-3238] N80-16031
Performance of computer-optimized tapered-roller bearings to 2.4 million DN
[NASA-TM-81414] N80-16342
Optimization techniques and numerical methods for aquifer management N80-16389

ORBITAL MECHANICS
Orbits near critical inclination, including lunisolar perturbations N80-16079

ORGANIC CHEMISTRY
Physio-chemical investigation of some areas of fundamental significance to biophysics
[ORO-3018-T1] N80-16721

ORGANIC COMPOUNDS
Estimation of the density of organic explosives from their structural formulas
[LA-7760-MS] N80-16188
Organic photochemical storage of solar energy
[COO-4380-2] N80-16527
Trace organic compounds in the New York City atmosphere. Part 1: Preliminary studies
[EPRI-EA-1121] N80-16582
Adsorption of energy-related organic pollutants: A literature review
[PB80-105117] N80-16595
Atmospheric reaction products of organic compounds
[PB-301384/4] N80-16610
Detailed characterization of gaseous and size resolved particulate pollutants at a south coast air basin smog receptor site: levels and modes of formation of sulfate, nitrate and organic particulates and their implications for control strategies
[PB-301294/5] N80-16611
Inventory of sources with emissions of 25 to 100 tons per year subject to organic material regulations in Metropolitan Boston AQCR
[PB-301242/4] N80-16613

ORGANIC LIQUIDS
Determination of water solubility in organic liquids
[RHO-SA-113] N80-16099

OSCILLATIONS
Shaft torsional oscillations of hydrogenerators
[PB80-102155] N80-16286

OSCILLATORS
A generalized derivative model for an elastomer damper N80-16223

OSMIUM COMPOUNDS
High resolution saturation spectroscopy with CO2 lasers. Application to the nu sub 3 bands of SF6 and OsO4
[LA-UR-79-1913] N80-16123

OUTER RADIATION BELT
Study of energetic electrons in the outer radiation-belt regions using data obtained by the LLL spectrometer on OGO-5 in 1968
[UCRL-52807] N80-17013

OUTGASSING
Trends in materials' outgassing technology
[NASA-TM-80585] N80-16117

OVERPRESSURE
An evaluation of the ADINA finite element program for application to aircraft overpressure vulnerability
[AD-A074261] N80-16056
Blast from bursting frangible pressure spheres N80-16208

OXIDATION
Titanium combustion in turbine engines
[AD-A075657] N80-16059
Experimental and theoretical investigation of ethylene oxidation in a fixed-bed reactor N80-16114

OXYGEN
Producing slush oxygen with an auger and measuring the storage characteristics of slush hydrogen
[NASA-CR-158412] N80-16256
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 2: The effect of non-Maxwellian electron distribution functions on ionization equilibrium calculations for carbon, nitrogen and oxygen
[NASA-CR-162695] N80-16852
Experiments on H2-O2MHD power generation
[NASA-TM-81424] N80-16886

OXYGEN IONS
Nature of oxygen containing radicals in radiation chemistry and photochemistry of aqueous solutions
[COO-3221-60] N80-16122

OXYGEN ISOTOPES
The influence of differential production and dissolution of the stable isotope composition of Planktonic foraminifera
[PB-299724/5] N80-16705

OZONE
Cooling tower water conditioning study --- using ozone
[NASA-CR-162691] N80-16576
Weekend/weekday differences in oxidants and their precursors
[PB-300479/3] N80-16612

A catalog of perturbing influences on stratospheric ozone, 1955-1975
[AD-A063650] N80-16646
The influence of variations in ozone concentration on the temperature regime of the atmosphere
[NASA-TM-75350] N80-16649
Report on the progress of regulations to protect stratospheric ozone
[PB-301368/7] N80-16665

OZONOMETRY
Summary of aircraft results for 1978 southeastern Virginia urban plume measurement study of ozone, nitrogen oxides, and methane
[NASA-TM-80146] N80-16575

P

P WAVES
Homogeneous magnitude system of the Eurasian continent: P waves
[PB-301282/0] N80-16666

PACIFIC ISLANDS
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, New Zealand, volume 4. Area 25, Auckland west; area 26, Auckland east; area 27, Cook Strait nw; area 28, Cook Strait; area 29, Hawke Bay; area 30, South Island nw; area 31, Foveaux Strait; area 32, Christchurch
[AD-A073875] N80-16686

PAINTS
Performance of Alternate Coatings in the Environment (PACE)
[PB-300868/7] N80-16174

PALEOMAGNETISM
Plate motions relative to the paleomagnetic axis and the lower mantle N80-16635

PANELS
Acoustoelastic analysis of center-cracked panels N80-16367
Aluminium or copper substrate panel for selective absorption of solar energy
[NASA-CASE-MFS-23518-3] N80-16452

PARALLEL PROCESSING (COMPUTERS)
Vectorized sparse examination
[AD-A074091] N80-16808

PARAMETERIZATION
Effects of secondary yield parameter variation on predicted equilibrium potential of an object in a charging environment --- using computerized simulation
[NASA-TM-79299] N80-16093
Computational methods of system identification and parameter estimation N80-16761

PARKS
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Rocky Mountain National Park
[PB-301334/9] N80-16430

PARSING ALGORITHMS
Formal description, coding and computer handling of generic formulae in chemical patents --- parsing algorithms
[BLL-BLRDR-5490] N80-16944

PARTIAL DIFFERENTIAL EQUATIONS
Optimization techniques and numerical methods for aquifer management N80-16389

PARTICLE BEAMS
Particle beam interactions with plasmas and their application to inertial fusion
[SAND-79-1411C] N80-16898

PARTICLE COLLISIONS
Central collisions in intermediate energy heavy-ion reaction
[CONF-790743-5] N80-16854
New directions in elementary particle physics: P anti p from very low to very high energies --- review of particle theory which includes particle collisions, particle energies, and elementary particle interactions
[BNL-26515] N80-16855
Coherence effects in heavy ion-atom collisions
[CONF-780936-1] N80-16860

PARTICLE ENERGY
New directions in elementary particle physics: P anti p from very low to very high energies --- review of particle theory which includes particle collisions, particle energies, and elementary particle interactions
[BNL-26515] N80-16855

PARTICLE INTERACTIONS
On the many-body theory for systems consisting of composite particles N80-16849

PARTICLE MASS
Soliton masses in supersymmetric theories
[COO-1764-363] N80-16928

PARTICLE MOTION
Turbulent dusty gas motions with weak statistical coupling
[UCRL-82131] N80-16307
The simple atomic hopping problem. Particle correlation functions with application to dipolar induced spin lattice relaxation N80-16850
Independent particle aspects of nuclear dynamics --- particle motion of nucleons N80-16863

PARTICLE PRODUCTION
The production of neutrinos and neutrino-like particles in proton-nucleus interactions N80-16847

PARTICLE SIZE DISTRIBUTION
Particle size measurements in solid propellant rocket exhaust plumes
[AD-A073556] N80-16098
Radiative transfer modeling applied to sea water constituent determination --- Gulf of Mexico
[NASA-TM-72736] N80-16406
An analysis of the factors affecting the distribution of heavy metals in a tidal estuary N80-16573

PARTICLE SPIN
Metric-connection theories of gravity --- particle spin N80-16643

PARTICLE THEORY
On the many-body theory for systems consisting of composite particles N80-16849
New directions in elementary particle physics: P anti p from very low to very high energies --- review of particle theory which includes particle collisions, particle energies, and elementary particle interactions
[BNL-26515] N80-16855
Research in elementary particle physics
[COO-3230-2] N80-16856
Theory of heavy ion collisions
[COO-3463-51] N80-16862

PARTICULATE SAMPLING
Environmental particulates: Characterization by helium plasma and elucidation of formation processes N80-16110

PARTITIONS (MATHEMATICS)
Approximation methods for the partition functions of anharmonic systems
[COO-3127-30-T1] N80-16857

PASSAGEWAYS
Evaluation of the potential for reduced longitudinal spacing on final approach
[AD-A076434] N80-16049

PATENT POLICY
Formal description, coding and computer handling of generic formulae in chemical patents --- parsing algorithms
[BLL-BLRDR-5490] N80-16944

PATTERN RECOGNITION
Computer-aided processing of LANDSAT MSS data for classification of forestlands --- San Juan Mountains, Colorado
[E80-10043] N80-16393
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394
Large Area Crop Inventory Experiment (LACIE). Detailed description of the wheat acreage estimation procedure used in the Large Area Crop Inventory Experiment
[E80-10051] N80-16399
Computing region moments from boundary representations
[NASA-CR-162685] N80-16767
Formal description, coding and computer handling of generic formulae in chemical patents --- parsing algorithms
[BLL-BLRDR-5490] N80-16944

PATTERN REGISTRATION
Evaluation of registration, compression, and classification algorithms. Volume 2: Documentation
[E80-10042] N80-16392
As-built design specification of software for cluster-based proportion estimation
[E80-10045] N80-16395

PAVEMENTS
Shrinkage-compensating cement for airport pavement, phase 2
[AD-A075739] N80-16197
Effect of subbase type and subsurface drainage on behavior of CRC pavements
[PB80-101165] N80-16240
Determination of the in situ permeability of base and subbase courses
[PB-300908/1] N80-16245
Evaluation of experimental flexible pavements
[PB-310251/5] N80-16246

PDP 11 COMPUTER
Digital Equipment Corporation, PDP 11/70, PDP 11 COBOL, version 4.0
[PB-299653/6] N80-16750

PELLETS
Mass spectrometer determination of argon contents in laser fusion target pellets
[UCRL-81416-REV-1] N80-16331

PERCOLATION
Treatment of secondary effluent by infiltration-percolation --- Boulder, Colorado
[PB80-103658] N80-16973

PERFLUORO COMPOUNDS
Perfluoroether triazine elastomers
[NASA-CR-162748] N80-16166

PERFORMANCE PREDICTION
Mechanical tunnel boring prediction and machine design
[PB80-101660] N80-16239
Performance prediction of computer architectures operating on linear mathematical models
[UCRL-52582] N80-16746
An averaging battery model for a lead-acid battery operating in an electric car
[NASA-TM-79321] N80-16824
CAB/cain evaluation project: A comparative study on the performance of two agricultural databases in a computerized current awareness service
[BLL-BLRDR-5483] N80-16941
Truck design optimization project. Phase 2: Analytical tool assessment report
[PB80-104888] N80-16960

PERFORMANCE TESTS
Experimental and theoretical investigation of ethylene oxidation in a fixed-bed reactor N80-16114
Performance of computer-optimized tapered-roller bearings to 2.4 million DN
[NASA-TM-81414] N80-16342
Test results of the DOE/Sandia 17 meter VAWT N80-16465
OTEC performance tests of the Union Carbide enhanced-tube condenser
[ANL/OTEC-PS-2] N80-16523
Performance evaluation of a low-first-cost, three-ton, air-to-air heat pump in the heating mode --- performance tests to analyze heat pumps and their corresponding systems
[ORNL/CON-18] N80-16551

PERIODIC VARIATIONS
Weekend/weekday differences in oxidants and their precursors
[PB-300479/3] N80-16612

PERIODICALS
An experiment in synopsis publishing in the field of mechanical engineering
[BLL-BLRDR-5498] N80-16945

PERMEABILITY
Hydrogen diffusion, dissolution and permeation of nonmetallic solids
[ORO-4721-T1] N80-16124
Determination of the in situ permeability of base and subbase courses
[PB-300908/1] N80-16245

PERMEATING
Nitrogen dioxide vapor penetration of chlorobutyl rubber SCAPE under operational conditions
[NASA-TP-1605] N80-16118

PERTURBATION THEORY
Orbits near critical inclination, including lunisolar perturbations N80-16079
Evolution of weak disturbances in inert binary mixtures
[NASA-TM-80925] N80-16298
Interior Reissner-Nordstrom black holes N80-16978

PETROLEUM PRODUCTS
Aggregated vectorial model of petroleum flow in the United States
[LBL-8874] N80-16178
Biological treatment of high strength petrochemical wastewater
[PB80-100456] N80-16959
PETROLOGY
Petrology and stratigraphy of paleogene nonmarine sandstones, Cascade Range, Washington
N80-16638
PHASE DIAGRAMS
Illustration of ternary diagram synthesis-Mn-Ti-Fe and Al-Ti-Fe
[BNL-26392] N80-16153
PHASE TRANSFORMATIONS
Tests of new theories for crystal anharmonicity
N80-16908
Dynamics near the phase transitions in liquid crystals N80-16909
Ginzburg-Landau theory and the superconducting transition in thin, amorphous bismuth films
N80-16912
PHOSPHONITRILES
Phosphonitrilic fluoroelastomer coated fabrics for collapsible fuel storage tanks
[AD-A074824] N80-16167
PHOSPHORUS COMPOUNDS
Emerging material systems for solar cell applications
[DOE/ET-23003/1] N80-16533
PHOTOCHEMICAL OXIDANTS
HAOS quality assurance final report: Criteria pollutants, volume 1
[PB-299639/5] N80-16583
HAOS quality assurance: Non-criteria pollutants, volume 2
[PB-299640/3] N80-16584
A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 1: Model formulation
[PB-300470/2] N80-16585
A Lagrangian photochemical air quality simulation model: Adaptation to the St. Louis RAPS data base. Volume 2: User's manual
[PB-300471/9] N80-16586
Weekend/weekday differences in oxidants and their precursors
[PB-300479/3] N80-16612
PHOTOCHEMICAL REACTIONS
Nature of oxygen containing radicals in radiation chemistry and photochemistry of aqueous solutions
[COO-3221-60] N80-16122
Photochemical energy storage, studies of inorganic photoassistance agents
[COO-4178-2] N80-16526
Organic photochemical storage of solar energy
[COO-4380-2] N80-16527
PHOTOCONDUCTIVITY
Organic photochemical storage of solar energy
[COO-4380-2] N80-16527
PHOTODECOMPOSITION
A study of the photodegradation of poly (methyl methacrylate) N80-16159
PHOTODISSOCIATION
Photodissociation processes in molecular beams
N80-16845
PHOTOELECTRICITY
Photovoltaic effect, its present understanding and remaining mysteries
[DOE/ET/23103-6] N80-16535
PHOTOGEOLOGY
Geologic application of thermal-inertia mapping from satellite --- Powder River Basin, Wyoming and Cabeza Prieta, Arizona
[E80-10050] N80-16398
NCSL remote sensing project --- State Legislature considerations and activities
[E80-10053] N80-16401
PHOTOGRAPHIC RECORDING
Digital recording using hologram arrays: Some initial experiments in 100 M bit/s recording
[BBC-RD-1979/23] N80-16312
PHOTOINTERPRETATION
Computer-aided processing of LANDSAT MSS data for classification of forestlands --- San Juan Mountains, Colorado
[E80-10043] N80-16393
PHOTOIONIZATION
Studies of electron correlation in the photoionization process N80-16903
PHOTOLYSIS
A study of the photodegradation of poly (methyl methacrylate) N80-16159
PHOTOMAPPING
NCSL remote sensing project --- State Legislature considerations and activities
[E80-10053] N80-16401
Gas production of Devonian shale wells relative to photo lineament locations: A statistical analysis
[METC/CR-79/28] N80-16410
Atlas of Mars: The 1:5000000 map series
[NASA-SP-438] N80-16998
PHOTON ABSORPTIOMETRY
Studies of atoms and molecules using multiphoton absorption of ultraviolet laser radiation N80-16844
NCMART: Algorithms and computer codes for a modified algebraic spatial reconstruction of spectroscopic emissivities for ELMO bumpy torus
[ORNL/TM-6500] N80-16896
PHOTONS
Double resonance spectroscopy of multiple-photon excited molecules
[COO-2793-15] N80-16858
Phonon scattering in metallic glasses
[BNL-26610] N80-16917
PHOTOOXIDATION
Oxidant air pollution impact to the forests of eastern United States: A literature review
[PB80-103500] N80-16589
PHOTOSENSITIVITY
Photochemical energy storage, studies of inorganic photoassistance agents
[COO-4178-2] N80-16526
PHOTOSYNTHESIS
Coastal upwelling ecosystems analysis. Interactions of primary nutrient and carbon uptake in the Peru current: A review and synthesis of laboratory and field results
[PB-301031/1] N80-16708
Theoretical studies of the light reactions in photosynthesis N80-16717
PHOTOVOLTAIC CELLS
Evaluation of concentrated space solar arrays using computer modeling --- for spacecraft propulsion and power supplies
[NASA-CR-162681] N80-16487
Objectives and strategies of the International Photovoltaic Program Plan
[SERI/TR-52-250] N80-16513
Federal photovoltaics utilization program
[DOE/EA-0087] N80-16525
Computer modelling of amorphous materials for photovoltaic conversion
[DOE/TIC-10165] N80-16536
Low-cost structures for photovoltaic arrays
[SAND-79-7006] N80-16537
PHOTOVOLTAIC CONVERSION
Semiconductor grade, solar silicon purification project
[NASA-CR-162746] N80-16495
Flywheel energy storage and conversion system for photovoltaic applications
[COO-4094-57] N80-16501
Solar photovoltaic field tests and applications project
[COO-4094-26] N80-16512
Proceedings: Photovoltaics user Review Panel
[SERI/TP-69-276] N80-16514
Application analysis and photovoltaic system conceptural design for service/commercial/institutional and industrial sectors, task 1 report
[SAND-78-7032] N80-16550
PHOTOVOLTAIC EFFECT
Photovoltaic effect, its present understanding and remaining mysteries
[DOE/ET/23103-6] N80-16535
PHYSIOCHEMISTRY
Physio-chemical investigation of some areas of fundamental significance to biophysics
[ORO-3018-T1] N80-16721
PHYSIOLOGICAL EFFECTS
Effects of ingestion of cold and hot water on the course of thermal changes in the stomach and intestine
[NASA-TM-75515] N80-16728
PICOSECOND PULSES
Picosecond dynamics of energy transfer in pure and mixed organic crystals N80-16901
PIEZOELECTRIC TRANSDUCERS
The design of efficient, broadband ultrasonic transducers N80-16833
PIGMENTS
Performance of Alternate Coatings in the Environment (PACE)
[PB-300868/7] N80-16174
PILOT PERFORMANCE
Modeling pilot response delays to beacon collision avoidance system commands
[AD-A075946] N80-16734
PILOT PLANTS
Conceptual design of a coal-to-methanol-to-gasoline commercial plant: Executive summary
[FE-2416-43] N80-16182
PINCH EFFECT
Production and diagnostics of dense nuclear plasmas
[NASA-CR-162656] N80-16884
PIPE FLOW
Losses caused by friction in straight pipes with systematic roughness elements
[ESDU-79014] N80-16288
Transitional flow in an annulus N80-16289
PIPES (TUBES)
Study of foldable elastic tubes for large space structure applications, phase 1
[NASA-CR-162652] N80-16083
Biaxial creep-fatigue behavior of type 316h stainless steel tube
[ANL-79-33] N80-16146
Losses caused by friction in straight pipes with systematic roughness elements
[ESDU-79014] N80-16288
PISTONS
Evolution of weak disturbances in inert binary mixtures
[NASA-TM-80925] N80-16298
PITCH (INCLINATION)
System configuration improvement N80-16481
PITUITARY GLAND
Influence of x irradiation and diet on pituitary/thyroid function in the rat
[UR-3490-1674] N80-16722
PLANAR STRUCTURES
Planar multijunction high voltage solar cells
[NASA-TM-81389] N80-16914
PLANETARY EVOLUTION
Evolution of the late Pennsylvanian-early Permian western Oquirrh Basin, Utah N80-16627
PLANETARY NEBULAE
Spectrophotometry of ring nebulae around Wolf-Rayet stars N80-16980
PLANETARY RADIATION
Narrow-band Jovian kilometric radiation: A new radio component
[NASA-TM-80626] N80-17001
The occurence rate, polarization character and intensity of broadband Jovian kilometric radiation --- Voyager Project
[NASA-TM-80627] N80-17002
PLANKTON
Phytoplankton water quality relationships in US lakes. Part 1: Methods, rationale and data limitations
[PB-298439/1] N80-16419
Phytoplankton water quality relationships in US lakes. Part 2: Genera Acanthosphaera through Cystodinium Collected from eastern and southeastern lakes
[PB-298440/9] N80-16420
Phytoplankton water quality relationships in US lakes. Part 3: Genera Dactylococcopsis through Gyrosigma collected from eastern and southeastern lakes
[PB-298441/7] N80-16421
Phytoplankton water quality relationships in US lakes. Part 4: Genera Hantzchia through Pteromonas collected from eastern and southeastern lakes
[PB-298442/5] N80-16422
Phytoplankton water quality relationships in US lakes. Part 5: Genera Quadrigula through Zygnema collected from eastern and southeastern lakes
[PB-298443/3] N80-16423
Ichthyoplankton abundance and diversity in the eastern Gulf of Mexico
[PB-299839/1] N80-16824

The influence of differential production and dissolution of the stable isotope composition of Planktonic foraminifera
[PB-299724/5] N80-16705
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16706
Factors influencing specific growth rates and seasonal abundance of eutrophic lake phytoplankton
N80-16716

PLASMA ARC WELDING
Fundamentals of plasma arc welding
[AD-A074340] N80-16343

PLASMA CONTROL
Production and diagnostics of dense nuclear plasmas
[NASA-CR-162656] N80-16884
Review of electron-beam heating of magnetic mirror confined plasmas, with application to the Tanden Mirror Experiment
[UCRL-52759] N80-16890

PLASMA CYLINDERS
Axis encircling ion gyro-radius
[SAI-79-023-766-LJ] N80-16895

PLASMA DENSITY
Whistler wave trapping in a density crest
[IPPJ-429] N80-16883

PLASMA DIAGNOSTICS
A twin optically-pumped far-infrared CH3OH laser for plasma diagnostics --- Tokamak devices
[IPPJ-428] N80-16882

PLASMA HEATING
Review of electron-beam heating of magnetic mirror confined plasmas, with application to the Tanden Mirror Experiment
[UCRL-52759] N80-16890

PLASMA INTERACTIONS
Lunar magnetism and plasma interactions
N80-16999

PLASMA PHYSICS
Plasma physics and problems of controlled thermonuclear reactions
[UCRL-TRANS-11487] N80-16888

PLASMA SHEATHS
The annihilation model of the Tormac sheath
N80-16879

PLASMA SPRAYING
Program to develop sprayed, plastically deformable compressor shroud seal materials
[NASA-CR-159741] N80-16338

PLASMA-PARTICLE INTERACTIONS
Particle beam interactions with plasmas and their application to inertial fusion
[SAND-79-1411C] N80-16898

PLASMAS (PHYSICS)
The annihilation model of the Tormac sheath
N80-16879
High beta Tokamaks
[CONF-780811-23] N80-16891

PLASTIC DEFORMATION
The effects of strain rate and strain history on the dynamic behavior of metallic materials N80-16140
Elastic and plastic strains and the stress corrosion cracking of austenitic stainless steels
[COO-2576-9] N80-16144
Dislocation model for twinning and fracture and its application to HCP metals
[CONF-790801-3] N80-16148
The effects of frequency, amplitude, and load on the dynamic properties of elastomers N80-16221
Structure inelasticity 24 Examples of non-uniqueness in contained plastic deformation
[AD-A074727] N80-16380

PLASTIC PROPELLANTS
Fiber-reinforced plastic-bonded explosives
[LA-7522-MS] N80-16191

PLASTICS
A penalty plate-bending element for the analysis of laminated anisotropic composite plates
[AD-A074236] N80-16375

PLATEAUS
Occurrence availability and chemical quality of ground water in the Edwards Plateau region of Texas
[PB-299790/6] N80-16426

PLATES (STRUCTURAL MEMBERS)
On harmonic motion of sandwich plates
[AD-A074637] N80-16168
Some approximations in vibrations and wave motion of elastic media N80-16364
Elastic stress concentration factors: Rectangular notch in the edge of a wide flat plate in tension
[ESDU-79008] N80-16372

PLOTTING
PIE: A FORTRAN subroutine for plotting circles, concentric circles, pie charts, and shaded pie charts
[ORNL/CSD/TM-82] N80-16781

PLUMES
A steady thermohaline convection model (driven by turbulent buoyant plumes from multiple isolated sources in a large nonturbulent finite region, with applications to the oceanic thermohaline circulation)
N80-16698

POINT SOURCES
Spherical harmonic analysis and some applications to surround sound
[BBC-RD-1979/25] N80-16831

POINTING CONTROL SYSTEMS
Research study: Space vehicle control systems
[NASA-CR-161368] N80-16092
A statistical look at modal displacement response to sequential excitations --- vibratory pointing error
N80-16213

POLAR REGIONS
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars
[NASA-TM-78254] N80-17004

POLARITY
Calculation of local fields in cubic lattices of polarizable atoms N80-16907

POLARIZATION (WAVES)
Faraday rotation measurement method and apparatus --- to receive RF signals from spacecraft which exhibits polarization characteristics due to spin stabilization
[NASA-CASE-NPO-14839-1] N80-16313

POLARIZATION CHARACTERISTICS
The occurence rate, polarization character and intensity of broadband Jovian kilometric radiation --- Voyager Project
[NASA-TM-80627] N80-17002

POLARIZED ELECTROMAGNETIC RADIATION
Antenna feed system for receiving circular polarization and transmitting linear polarization
[NASA-CASE-NPO-14362-1] N80-16261

POLICIES
Space shuttle operational planning, policy and legal issues
[GPO-53-649] N80-16088
Impact of air quality control measures
[PB-301234/1] N80-16605
An analysis of alternative policies for attaining and maintaining a short-term NO2 standard
[PB80-100530] N80-16608
Linking science and technology to public policy: The role of universities
[PB80-108202] N80-16934

POLLUTION CONTROL
Environmental development plan: Underground coal gasification
[DOE/EDP-0047] N80-16411
Optimal treatment levels of a stream pollution abatement system under three environmental control policies. Part 2: Preliminary sensitivity analysis of a convex equivalent of the fixed dissolved oxygen requirement policy GP model using SENSUMT
[AD-A074216] N80-16579
Status of pollutant removal technology for coal fired plants in the northeastern U.S.
[BNL-51004] N80-16580
Balancing the objectives of clean air and economic growth: Regulated markets in emission reductions
[PB-300835/6] N80-16598
Environmental assessment of stationary source NOx control technologies
[PB-300469/4] N80-16601
A review of standards of performance for new stationary sources: Petroleum refineries
[PB-300480/1] N80-16602
Evaluation of the ultraviolet-ozone and ultraviolet-oxidant treatment of pink water
[PB-300763/0] N80-16603
Impact of air quality control measures
[PB-301234/1] N80-16605
An analysis of alternative policies for attaining and maintaining a short-term NO2 standard
[PB80-100530] N80-16608
Potential production and marketing of FGD byproduct sulfur and sulfuric acid in the US (1983 projection)
[PB-299205/5] N80-16617
A standard procedure for cost analysis of pollution control operations. Volume 1: User guide
[PB80-108038] N80-16619
A standard procedure for cost analysis of pollution control operations. Volume 2: Appendices
[PB80-108046] N80-16620
Municiple wastewater treatment by the overland flow method of land application
[PB80-102908] N80-16957

POLLUTION MONITORING
Altitude characteristics of selected air quality analyzers
[NASA-CR-159165] N80-16578
Trace organic compounds in the New York City atmosphere. Part 1: Preliminary studies
[EPRI-EA-1121] N80-16582
HAOS quality assurance final report: Criteria pollutants, volume 1
[PB-299639/5] N80-16583
HAOS quality assurance: Non-criteria pollutants, volume 2
[PB-299640/3] N80-16584
Development of an SO2 monitor for mobile sources
[PB80-100472] N80-16606
Development of a monitor for HCN in mobile source emissions
[PB80-100514] N80-16607
Inventory of sources with emissions of 25 to 100 tons per year subject to organic material regulations in Metropolitan Boston AQCR
[PB-301242/4] N80-16613
The Environmental Protection Agency four corners ambient air monitoring network
[PB80-103559] N80-16614
Continuous air pollution source monitoring systems
[PB-300930/5] N80-16615
Guidance for selecting TSP episode monitoring methods
[PB-298459/9] N80-16618
Outer continental shelf environment monitoring concerns
[PB-299861/5] N80-16625

POLYCRYSTALS
Dynamic yielding of polycrystalline materials under biaxial loading N80-16366
Photovoltaic Materials and Device Measurements Workshop: Focus on polycrystalline thin film cells
[SERI/TP-49-185] N80-16538
X-ray pole figure analysis
[BDX-613-1829-REV] N80-16876

POLYIMIDE RESINS
Manufacturing processes for fabricating graphite/PMR 15 polyimide structural elements
[NASA-CR-159129] N80-16105

POLYIMIDES
Catalysts for polyimide foams from aromatic isocyanates and aromatic dianhydrides --- flame retardant foams
[NASA-CASE-ARC-11107-1] N80-16116
Crystalline polyimides --- reinforcing fibers for high temperature composites and adhesives as well as flame retardation
[NASA-CASE-LAR-12099-1] N80-16158
Aluminum ion-containing polyimide adhesives --- bonding temperature resistant materials
[NASA-CASE-LAR-12640-1] N80-16164

POLYMERIC FILMS
An optical investigation of the correlation between mass transport and mechanical properties of strained polymer films N80-16161
Mechanisms of lubrication and wear of a bonded solid lubricant film
[NASA-TM-81396] N80-16165

POLYMERS
Thermal stability of isocyanate based polymers
N80-16162
Polymer materials basic research needs for energy applications: Proceedings of a Workshop Recommending Future Directions in Energy-Related Polymer Research
[CONF-780643] N80-16172

An experimental investigation of the effect of drag reducing polymer additives on surface pressure fluctations on bodies of revolution with rough surfaces moving through water
[AD-A073836] N80-16302

Method for separating biological cells --- suspended in aqueous polymer systems
[NASA-CASE-MFS-23883-1] N80-16715

POLYMETHYL METHACRYLATE
A study of the photodegradation of poly (methyl methacrylate) N80-16159

POLYNOMIALS
Classes of non-commutative rings with dedekind domain-like properties and module over non-commutative valuation rings N80-16790

POLYURETHANE FOAM
Polyurethane foam, 0.05 g/cm3 density
[BDX-613-1964-REV] N80-16170

Characterization of halthane polyurethane adhesives. 1: Dynamic mechanical and thermal properties
[UCRL-82694] N80-16171

POROSITY
The effects of pore fluids and frictional sliding on seismic attenuation N80-16640

PORPHYRINS
Method and apparatus for eliminating luminol interference material
[NASA-CASE-MSC-16260-1] N80-16714

POSITION (LOCATION)
Dipole broadside glide slope array --- for landing systems
[AD-A077042] N80-16047

Technique to determine location of radio sources from measurements taken on spinning spacecraft
[NASA-TM-80598] N80-16280

Determination of astronomic positions for California-Nevada boundary monuments near Lake Tahoe
[PB-301264/8] N80-16664

POTASSIUM
Radiation from Ag and K film bombarded by low energy electrons
[ORNL/TM-6527] N80-16859

POTENTIAL ENERGY
Poleward heat flux and conversion of available potential energy in Drake passage
[PB-301311/7] N80-16712

POWDER (PARTICLES)
Activated carbon treatment of industrial wastewaters: Selected technical papers
[PB80-100522] N80-16963

POWER AMPLIFIERS
Antares laser power amplifier --- using a carbon dioxide laser
[LA-UR-79-1525] N80-16328

Antares power amplifier optical system
[LA-UR-79-2270] N80-16332

POWER CONDITIONING
Workshop on Power Conditioning for Alternative Energy Technologies, executive summary
[SERI-TP-35-217-PT-2] N80-16505

Vehicle longitudinal control and reliability project. A review of AGT propulsion, power conditioning, braking and power distribution technology, volume 2, part C
[PB-300373/9] N80-16954

POWER EFFICIENCY
Performance characteristics of a commercially available point-focus solar power --- systems analysis of a solar energy conversion system in terms of power efficiency and energy conversion efficiency
[SERI/TP-34-169] N80-16529

POWER SUPPLY CIRCUITS
Sealed-cell nickel-cadmium battery applications manual
[NASA-RP-1052] N80-16095

PRECAMBRIAN PERIOD
Geology of precambrian metamorphic rocks of the Truchas Peaks area, north-central New Mexico N80-16626

Preliminary geologic appraisal and economic aspects of the Precambrian basement of Iowa N80-16633

PRECIPITATION (METEOROLOGY)
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10048] N80-16396

Month and year ahead forecasting of monthly precipitation for the southeastern United States N80-16670

Project skywater. Skywater conference 10, June 1978: The Sierra cooperative pilot project design
[PB-298529/9] N80-16996

PRECIPITATION HARDENING
Stress corrosion cracking evaluation of martensitic precipitation hardening stainless steels
[NASA-TM-78257] N80-16142

PRECIPITATION PARTICLE MEASUREMENT
Apparatus and techniques for the study of precipitation of solids and silica from hypersaline geothermal brine
[UCRL-52799] N80-16127

PREDICTION ANALYSIS TECHNIQUES
Evaluation of use of MPAD trajectory tape and number of orbit points for orbiter mission thermal predictions
[NASA-TM-80946] N80-16081

Prediction of fiber composite mechanical behavior made simple --- using a rocket calculator
[NASA-TM-81404] N80-16107

Truck design optimization project. Phase 2: Analytical tool assessment report
[PB80-104886] N80-16960

PRESSURE DISTRIBUTION
Application of numerical optimization to the design of wings with specified pressure distributions
[NASA-CR-3238] N80-16031

A comparison of calculated and experimental lift and pressure distributions for several helicopter rotor sections
[NASA-TM-81160] N80-16036

Continuous self-locking spiral wound seal --- for maintaining pressure between chambers in cryogenic wind tunnels
[NASA-CASE-LAR-12315-1] N80-16339

PRESSURE EFFECTS
Altitude characteristics of selected air quality analyzers
[NASA-CR-159165] N80-16578

PRESSURE OSCILLATIONS
An experimental investigation of the effect of drag reducing polymer additives on surface pressure fluctations on bodies of revolution with rough surfaces moving through water
[AD-A073836] N80-16302

PRESSURE SENSORS
NBS interagency transducer project: An coverview, 1951 - 1979 --- technology assessment of pressure sensors used in telemetry
[PB-300369/6] N80-16316

PRESSURE VESSELS
Blast from bursting frangible pressure spheres N80-16208

Prediction of fragment velocities and trajectories N80-16210

Heavy-section steel technology program --- for liquid cooled reactor materials
[NUREG-CR-0618] N80-16235

Development of automated welding processes for field fabrication of thick-walled pressure vessel: Electron beam method
[DOE/ET-2606/3] N80-16348

PRIVACY
Computer science and technology: A key notarization system for computer networks
[PB80-104698] N80-16787

PROBABILITY DENSITY FUNCTIONS
Confidence intervals for an exponential parameter from a two stage life test --- probability density functions
[AD-A073696] N80-16359

PROBABILITY DISTRIBUTION FUNCTIONS
Efficient procedure for selecting among five reliability models
[ORNL/CSD-43] N80-16362

Distributional results for random functionals of a Dirichlet process
[AD-A074698] N80-16818

PROBABILITY THEORY
Probabilistic analysis of temperature loads for structures, structural loads analysis and specifications project
[PB-301415/8] N80-16251

Fast algorithms for NP-hard problems which are optimal or near-optimal with probability one N80-16758

An extension of Strassen's law and some probabilistic results in complex analysis --- brownian movements N80-16795

Probability and statistics and applications
[AD-A074257] N80-16821

PROBLEM SOLVING
Interactive solution of multicriterion zero-one variable problems with uncertain information N80-16823

Network flows, volume 1. A bibliography with abstracts
[NTIS/PS-79/1077/1] N80-16827

PROCESS CONTROL (INDUSTRY)
Polyurethane foam, 0.05 g/cm3 density
[BDX-613-1964-REV] N80-16170

East Europe report: Scientific affairs, no. 658 --- process computer technology and computer system reliability
[JPRS-74833] N80-16753

Process computer technology development reviewed N80-16754

PRODUCT DEVELOPMENT
Emerging material systems for solar cell applications
[DOE/ET-23003/1] N80-16533

PRODUCTION ENGINEERING
Survey of potential chlorine production processes --- for energy efficiency
[ANL/OEPM-79-1] N80-16131

Coal gasification
[DOE/ET-0067/3] N80-16164

Information approach to parts mating --- for use on assembly systems for industrial engineering and product engineering
[PB-300519/6] N80-16352

Alcoa wind turbines N80-16464

Manufacturing methods of a composite cell case for a Ni-Cd battery
[NASA-CR-162724] N80-16488

PRODUCTIVITY
Factors influencing specific growth rates and seasonal abundance of eutrophic lake phytoplankton N80-16716

PROFILE METHOD (FORECASTING)
Technological forecasting-aircraft design. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/1017/7] N80-16057

PROGRAM VERIFICATION (COMPUTERS)
Datapoint 6600 COBOL 2.3
[PB-299651/0] N80-16748

Digital Equipment Corporation, PDP 11/70, PDP 11 COBOL, version 4.0
[PB-299653/6] N80-16750

Formalizing the analysis of algorithms N80-16758

PROGRAMMED INSTRUCTION
Software science and program complexity measures N80-16764

PROGRAMMING (SCHEDULING)
Comparability for UHF television: A preliminary analysis
[PB-301267/1] N80-16270

PROGRAMMING LANGUAGE
Adaptation of set-defining notation to the specification of formal languages N80-16783

On-line programmer's management system. Addendum 1: User's guide to the JOVIAL debugger
[AD-A074495] N80-16775

PROJECT MANAGEMENT
Space shuttle operational planning, policy and legal issues
[GPO-53-649] N80-16086

Overview of Federal wind energy program N80-16454

PROJECT PLANNING
Solar power satellite system definition study, phase 2. Volume 2: Reference system description
[NASA-CR-160443] N80-16096

Hydrothermal electric and direct heat. Commercialization phase 3 planning
[DOE/ERD-0005] N80-16545

PROJECTILES
Terminal velocity and rotation rate of a flyer plate propelled by a tube-confined explosive charge N80-16209

PROPELLANT TANKS
Homogeneous vortex model for liquid slosh in spinning spherical tanks
[NASA-CR-162725] N80-16299

PROPULSION SYSTEM CONFIGURATIONS
An evaluation of direct current electromagnetic propulsion in seawater
[AD-A074830] N80-16290
Apparatus for endoscopic examination — analysis of the propulsion system configuration and transmitter
[NASA-CASE-NPO-14082-1] N80-16725
PROPULSION SYSTEM PERFORMANCE
Potential performance improvement using a reacting gas (nitrogen tetroxide) as the working fluid in a closed Brayton cycle
[NASA-TM-79322] N80-16490
PROSTHETIC DEVICES
Prosthetic device for correction of urinary incontinence
[NASA-TM-78255] N80-16739
PROTECTIVE CLOTHING
Nitrogen dioxide vapor penetration of chlorobutyl rubber SCAPE under operational conditions
[NASA-TP-1605] N80-16110
PROTECTIVE COATINGS
Performance of Alternate Coatings in the Environment (PACE)
[PB-300868/7] N80-16174
PROTON IRRADIATION
Irradiation damage in metals produced by 800-MeV protons
[LA-7939-MS] N80-16145
PROTONS
The production of neutrinos and neutrino-like particles in proton-nucleus interactions N80-16847
New directions in elementary particle physics: P anti p from very low to very high energies — review of particle theory which includes particle collisions, particle energies, and elementary particle interactions
[BNL-26515] N80-16865
PROTOTYPES
Specification, siting and selection of large WECS prototypes N80-16459
PULSE COMMUNICATION
Investigation of digital microwave communications in a strong meteorological ducting environment
[PB-301212/7] N80-16260
PULSE DURATION
High-energy, short-pulse, carbon-dioxide lasers
[LA-UR-79-1269] N80-16326
PULSED LASERS
Evaluation of the effect of prepulses on HF laser-target interactions
[SAND-79-0383] N80-16329
PUMPING
Solar powered agricultural irrigation pumping
[PB-296294/9] N80-16570
PURIFICATION
Semiconductor grade, solar silicon purification project
[NASA-CR-162746] N80-16495
PURSUIT TRACKING
Dynamic analysis of beam-rider missile performance
[TAE-378] N80-16085
PYROELECTRICITY
Dielectric and pyroelectric properties of ferroelectrics N80-16275
PYROHELIOMETERS
Normal incident solar radiation measurements at Upton, New York
[BNL-50939] N80-16853
PYROLYSIS
Flash hydropyrolysis of coal
[BNL-51010] N80-16195
Anaerobic biological treatment of liquid wastes from pyrolysis processes
[COO-4455-2] N80-16723
Mathematical modeling and experimental studies of thermal reactions of coal — mathematical model of coal pyrolysis N80-16825
PYROTECHNICS
Fiber-reinforced plastic-bonded explosives
[LA-7522-MS] N80-16191
High G pyrotechnic shock simulation using metal-to-metal impact N80-16206

Q

QUALITY CONTROL
A simple low-cost technique for measuring material damping behavior N80-16220
Computerized quality control techniques — and a computer systems design
[CONF-790707-11] N80-16361
QUANTUM MECHANICS
Soliton masses in supersymmetric theories
[COO-1764-380] N80-16028
Interaction between classical and quantum systems: A new approach to quantum measurement. 2: Theoretical considerations
[ORO-3992-342] N80-16930
Interaction between classical and quantum systems: A new approach to quantum measurement. 3: Illustration
[ORO-3992-343] N80-16931
QUANTUM THEORY
Interaction between classical and quantum systems: A new approach to quantum measurement. 2: Theoretical considerations
[ORO-3992-342] N80-16930
Interaction between classical and quantum systems: A new approach to quantum measurement. 3: Illustration
[ORO-3992-343] N80-16931
QUARKS
Multiquark mesons revisited
[ORO-3992-344] N80-16870
QUATERNARY ALLOYS
Long-life fatigue test results for two nickel-base structural alloys
[KAPL-4105] N80-16150

R

RADAR ABSORBERS
Radar absorber measurement techniques at frequencies above 20 GHz
[PB-299576/9] N80-16271
RADAR BEACONS
Transponder Performance Analyzer (TPA)
[AD-A075780] N80-16046
Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods
[APL/JHU/SIR-79U-016] N80-16262
RADAR IMAGERY
L-band radar sensing of soil moisture — Kern County, California
[NASA-TM-80628] N80-16404
RADAR MEASUREMENT
Radar absorber measurement techniques at frequencies above 20 GHz
[PB-299576/9] N80-16271
RADAR SCATTERING
The internal refractive index spectra of clouds from forward scatter radar observations
[PB80-107238] N80-16866
RADIAL FLOW
Study of advanced radial outflow turbine for solar steam Rankine engines
[NASA-CR-159695] N80-16463
RADIANT HEATING
Radiant heating of mine bulkheads
[PB-300363/9] N80-16444
RADIATION CHEMISTRY
Irradiation damage in metals produced by 800-MeV protons
[LA-7939-MS] N80-16145
RADIATION DAMAGE
Irradiation damage in metals produced by 800-MeV protons
[LA-7939-MS] N80-16145
RADIATION EFFECTS
Influence of x irradiation and diet on pituitary/thyroid function in the rat
[UR-3480-1674] N80-16722
RADIATION HARDENING
The effects of interstitial impurities radiation temperature on voids swelling and irradiation hardening in the neutron irradiated molybdenum N80-16139
Radiation-hardened bulk CMOS technology
[SAND-79-0714C] N80-16919
RADIATION MEASUREMENT
Normal incident solar radiation measurements at Upton, New York
[BNL-50939] N80-16853
RADIATION SOURCES
On the generation of auroral kilometric radiation N80-16944
RADIATIVE HEAT TRANSFER
Experimental test facility for selective radiative cooling surfaces
[LBL-9997] N80-16518
RADIATIVE TRANSFER
Some fundamental considerations of the equation of radiative transfer
[ORO-3992-345] N80-16298
Radiative transfer modeling applied to sea water constituent determination — Gulf of Mexico
[NASA-TM-72736] N80-16408
RADIO ASTRONOMY
Radio astronomical observations of regions of star formation N80-16979
A radio survey of bright galaxies N80-16984
RADIO BEACONS
Telemetry from orbit N80-16079
RADIO COMMUNICATION
A compatibility analysis of spread-spectrum and FM land mobile radio systems
[PB-300851/7] N80-16289
Ionospheric storm effects on maximum usable frequencies on circuits around Australia
[IPS-R-36] N80-16947
RADIO EMISSION
Narrow-band Jovian kilometric radiation: A new radio component
[NASA-TM-80620] N80-17001
The occurrence rate, polarization character and intensity of broadband Jovian kilometric radiation — Voyager Project
[NASA-TM-80627] N80-17002
RADIO FREQUENCY INTERFERENCE
Probability of intermodulation interference in an expanded CB service
[PB-300295/1] N80-16267
RADIO GALAXIES
A radio survey of bright galaxies N80-16984
RADIO NAVIGATION
Long-range electronic navigation systems in the Hawaiian Archipelago
[PB-300842/2] N80-16052
RADIO RECEIVERS
Faraday rotation measurement method and apparatus — to receive RF signals from spacecraft which exhibits polarization characteristics due to spin stabilization
[NASA-CASE-NPO-14039-1] N80-16313
RADIO RELAY SYSTEMS
The initial growth and expanding opportunities of US domestic satellite service
[PB-300436/9] N80-16272
RADIO SOURCES (ASTRONOMY)
Technique to determine location of radio sources from measurements taken on spinning spacecraft
[NASA-TM-80599] N80-16990
Narrow-band Jovian kilometric radiation: A new radio component
[NASA-TM-80620] N80-17001
RADIO TELEMETRY
Telemetry from orbit N80-16079
RADIO TRANSMISSION
On the effect of redundancy on the multiple access broadcast channel
[AD-A073679] N80-16265
RADIO WAVES
Narrow-band Jovian kilometric radiation: A new radio component
[NASA-TM-80620] N80-17001
RADIOACTIVE DECAY
Theoretical studies of bound exciton decay and of transport across semiconductor interfaces N80-16904
RADIOACTIVE WASTES
Sediment characteristics of the 2800 meter Atlantic nuclear waste disposal site: Radionuclide retention potential
[PB-301265/6] N80-16871
Low-level radioactive waste management. Volume 5: Policy recommendations, conclusions and summary
[PB80-106263] N80-16872

Low-level radioactive waste management. Volume 2: Forecast of low-level radwaste management requirements
[PB80-105059] N80-16873
Low-level radioactive waste management. Volume 3: Feasibility of volume-reduction processes — for waste treatment
[PB80-105067] N80-16874

RADIOBIOLOGY
Nature of oxygen containing radicals in radiation chemistry and photochemistry of aqueous solutions
[COO-3221-69] N80-16122

RADIOCHEMISTRY
Nature of oxygen containing radicals in radiation chemistry and photochemistry of aqueous solutions
[COO-3221-69] N80-16122

RADON ISOTOPES
Measurement of eddy diffusivity and solute transport through the near-sediment boundary layer of ice-covered lakes, using Radon-222 N80-16380

RAIN
Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods
[APL/JHU/SIR-79U-019] N80-16262
Recent rain measurement maps of Belgium N80-16880

RAINSTORMS
Hydrologic data from urban watersheds in the Tampa Bay region
[PB-301204/4] N80-16447

RAMAN SPECTRA
Light scattering studies of solids and atomic vapors
[LBL-8222] N80-16173

RANDOM PROCESSES
Variance approximations for estimators of fixed and random effects in mixed linear models N80-16796
Output ensemble average of periodically excited linear time-varying systems — applicable to a missile intercept problem
[TAE-372] N80-16798
Estimation of random fields from network observations
[COO-2874-54] N80-16811

RANDOM SAMPLING
Influence functions for censored data N80-16794
Spectral estimation for a randomly sampled time-series N80-16814

RANDOM VARIABLES
Confidence intervals for the common variance of equicorrelated normal random variables
[AD-A074339] N80-16800
Estimation of random fields from network observations
[COO-2874-54] N80-16811
A Bayesian approach to the selection of variables in multiple regression N80-16815
Distributional results for random functionals of a Dirichlet process
[AD-A074698] N80-16816

RANDOM VIBRATION
Application of random time domain analysis to dynamic flight measurements — B-1 aircraft N80-16226

RANKINE CYCLE
Study of advanced radial outflow turbine for solar steam Rankine engines
[NASA-CR-159895] N80-16483
A 15kWe (nominal) solar thermal electric power conversion concept definition study. Steam Rankine reheat reciprocator system
[NASA-CR-159580] N80-16431
The 15 kW sub e (nominal) solar thermal electric power conversion concept definition study. Steam Rankine turbine system
[NASA-CR-159560] N80-16483

RAPID TRANSIT SYSTEMS
Vehicle longitudinal control and reliability project. A review of entrainment technology
[PB-300372/0] N80-16955
Local and regional development and transportation needs
[PB-301207/7] N80-16970
AGT guideway and station technology. Volume 8: Weather protection concepts
[PB-298746-9] N80-16974

RARE EARTH ALLOYS
Magnetic critical temperature gap in Gd-Y alloys
[GM-238] N80-16916

RARE GASES
Inert gas welding. Citations from the NTIS data base — a bibliography with abstracts
[NTIS/PS-79/0995/5] N80-16353
Inert gas welding, volume 3: Citations from the Engineering Index data base — a bibliography with abstracts
[NTIS/PS-79/0996/3] N80-16354
Noble-gas-rich separates from ordinary chondrites N80-17000

RAY TRACING
Finite temperature effect of ray tracing near the electron cyclotron resonance
[IPPJ-427] N80-16881

REACTION KINETICS
Sintering kinetics of pure and doped boron carbide
[UCRL-82515] N80-16108
Experimental and theoretical investigation of ethylene oxidation in a fixed-bed reactor N80-16114
The reduction of silica and mullite in hydrogen — kinetics, thermodynamics, and mass transport phenomena N80-16115
Chemical kinetics in LNG detonations
[UCRL-82293-REV-1] N80-16180
Theoretical studies of the light reactions in photosynthesis N80-16717

REACTOR DESIGN
Systems-design and energy-balance considerations for impact fusion
[LA-UR-79-1969] N80-16899

REACTOR SAFETY
Evaluation of Lagrangian, Eulerian, arbitary Lagrangian-Eulerian methods for fluid-structure interaction problems in HCDA analysis
[CONF-790802-55] N80-16295
Soil structure interaction in different seismic environments
[PB80-101520] N80-16658
Aspects of Tokamak toroidal magnet protection
[COO-2431-6] N80-16900

REACTORS
Hydrogen pellet fueling experiment on the ISX-A Tokamak
[ORNL/TM-6496] N80-16892

REAL TIME OPERATION
Analog double integration of shock pulses N80-16231

RECEIVERS
Results of a Loran-C flight test using an absolute data reference
[NASA-CR-162751] N80-16051

RECIRCULATIVE FLUID FLOW
Boundary conditions for flow computation with nonorthogonal curvilinear coordinates
[KAPL-4123] N80-16304

RECLAMATION
Strip coal mining and mined-land reclamation in the hydrologic system, southeastern Montana
[PB-301253/1] N80-16441

REDUCTION (CHEMISTRY)
Conversion of isotope compounds to metal by reduction-distillation methods
[CONF-780943-2] N80-16125

REDUNDANCY ENCODING
On the effect of redundancy on the multiple access broadcast channel
[AD-A073579] N80-16265

REENTRY TRAJECTORIES
Optimum reentry trajectories of a lifting vehicle
[NASA-CR-3236] N80-16080
Space shuttle solid rocket booster aft skirt reentry noise induced by an aerodynamic cavity-flow interaction N80-16203

REENTRY VEHICLES
Aerodynamic coefficient estimation by means of an extended Kalman filter — to study dynamic models of reentry vehicle motion
[SAND-79-0411C] N80-16039

REFINING
A review of standards of performance for new stationary sources: Petroleum refineries
[PB-300480/1] N80-16602

REFLECTANCE
Design of a reflection on apparatus for laser beam profile measurements
[PB80-101256] N80-16877

REFLECTED WAVES
Modeling the beam characterization system
[SAND-79-1295C] N80-16530

REFRACTIVITY
The internal refractive index spectra of clouds from forward scatter radar observations
[PB80-107238] N80-16660

REFRACTORY MATERIALS
Refractory particles in cullet recovered from municipal refuse
[PB-300523/8] N80-16597

REGENERATIVE COOLING
Solar-MEC development program, project 9103
[COO-4495-7] N80-16522

REGIONAL PLANNING
Local and regional development and transportation needs
[PB-301207/7] N80-16970

REGRESSION ANALYSIS
Empirical Bayes estimation of critical dosages having smallest predictive risk
[AD-A074376] N80-16729
A Bayesian approach to the selection of variables in multiple regression N80-16815
Contingency factors affecting the user involvement role in the design of successful information systems N80-16936

REGULATIONS
The Environmental Protection Agency's role in the protection of wetlands: Examination of EPA's participation in the section 404 regulatory program N80-16574
Balancing the objectives of clean air and economic growth: Regulated markets in emission reductions
[PB-300835/6] N80-16598

REINFORCED PLASTICS
Fiber-reinforced plastic-bonded explosives
[LA-7522-MS] N80-16191

REINFORCEMENT (STRUCTURES)
Evaluation of the effectiveness of fabric reinforcement in extending the in-service life of bituminous concrete overlays
[PB-301305/9] N80-16248
Aseismic design procedures for reinforced concrete frames. Seismic behavior and design of buildings
[PB80-104128] N80-16249
Initial imperfection measurements of integrally Stringer-stiffened cylindrical shells
[TAE-330] N80-16374

REINFORCING FIBERS
Preparation of fiber reinforced titanium diboride and boron carbide composite bodies
[LA-UR-79-969] N80-16109
Crystalline polyimides — reinforcing fibers for high temperature composites and adhesives as well as flame retardation
[NASA-CASE-LAR-12099-1] N80-16158

RELATIVISTIC EFFECTS
Pinched relativistic electron beams and collective acceleration of ions N80-16274

RELATIVISTIC ELECTRON BEAMS
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air N80-16257

RELATIVITY
Interior Reissner-Nordstrom black holes N80-16978

RELIABILITY
A general approach to ordering of parameters with application in reliability
[AD-A074246] N80-16357
East Europe report: Scientific affairs, no. 658 — process computer technology and computer system reliability
[JPRS-74833] N80-16753
Reliability rate of computer systems described N80-16755
Influence functions for censored data N80-16794

RELIABILITY ANALYSIS
Efficient procedure for selecting among five reliability models
[ORNL/CSD-43] N80-16362

REMOTE MANIPULATOR SYSTEM
Solar maximum mission panel jettison analysis remote manipulator system
[NASA-CR-162466] N80-16073

REMOTE SENSORS
A spectral filter for ESMR's sidelobe errors
[NASA-TM-80555] N80-16402
Illinois LANDSAT feasibility study
[NASA-CR-162760] N80-16424

Rapid-scanning measurements of wind-produced doppler on an asymmetrical microwave transhorizon propagation path N80-16674
The role of satellite altimetry in climate studies
[NASA-TP-1570] N80-16676

RESEARCH AIRCRAFT
NASA quiet short-haul research aircraft experimenters' handbook
[NASA-TM-81162] N80-16024

RESEARCH AND DEVELOPMENT
Weather modification --- congressional reports
[GPO-55-607] N80-16684

RESEARCH FACILITIES
Potential utilization of the NASA/George C. Marshall Space Flight Center in earthquake engineering research
[NASA-CR-161371] N80-16650

RESEARCH MANAGEMENT
Polymer materials basic research needs for energy applications. Proceedings of a Workshop Recommending Future Directions in Energy-Related Polymer Research
[CONF-780643] N80-16172
Coal gasification
[DOE/ET-0067/3] N80-16184
Energy policy and research planning, volume 3. A bibliography with abstracts
[NTIS/PS-79/1069/8] N80-16563
An experiment in synopsis publishing in the field of mechanical engineering
[BLL-BLRDR-5498] N80-16945
East Europe report: Scientific affairs, no. 659
[JPRS-74911] N80-17015

RESIDENTIAL AREAS
A study of indirect fire losses from fires in non-residential properties. Volume 3: Indirect residential fire loss - a case study
[PB-299127/1] N80-16242
Federal demonstrations of solar heating and cooling on private residences: Only limited success
[PB-301123/6] N80-16555
Comparative assessment of residential energy supply systems that use fuel cells
[PB-299208/9] N80-16565
Research plan for establishing the effects of time varying noise exposures on community annoyance and acceptability
[NASA-CR-159197] N80-16577

RESONANCE
Double resonance spectroscopy of multiple-photon excited molecules
[COO-2793-15] N80-16858

RESONANT FREQUENCIES
The free vibration equations, natural frequencies and modal characteristics of closed circular cylindrical shells
[NAL-TR-569T] N80-16373

RESOURCES MANAGEMENT
NCSL remote sensing project --- State Legislature considerations and activities
[E80-10053] N80-16401
Illinois LANDSAT feasibility study
[NASA-CR-162760] N80-16424
Heuristic decision rules for water resources planning
[PB-300578/2] N80-16435
Environmental impact and economic evaluation research needs for coastal and marine resource management
[PB-301208/5] N80-16604
Weather modification --- congressional reports
[GPO-55-607] N80-16684

RESPIRATION
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16706

REVERSE OSMOSIS
Pretreatment of seawater for reverse osmosis processes, 1976
[PB-300509/7] N80-16134

REVERSED FLOW
Natural convection in a vertical channel with heat and mass transfer and flow reversal N80-16291

REYNOLDS NUMBER
Mass transfer controlled reactions in packed beds at low Reynolds numbers N80-16112

RIGID ROTORS
WTG Energy Systems' MP1-200 200 kilowatt wind turbine generator --- a fixed pitch rotor configuration driving a synchronous generator N80-16458

RIGID STRUCTURES
Research study: Space vehicle control systems
[NASA-CR-161368] N80-16092

RINGS (MATHEMATICS)
Classes of non-commutative rings with dedekind domain-like properties and module over non-commutative valuation rings N80-16790
Smooth group actions of prime order and fixed point sets N80-16791

RIO GRANDE (NORTH AMERICA)
Hydrologic data on channel adjustments, 1970 to 1975, on the Rio Grande downstream from Cochiti Dam, New Mexico, before and after closure
[PB-301134/3] N80-16425

RIVER BASINS
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10046] N80-16396
Geologic application of thermal-inertia mapping from satellite --- Powder River Basin, Wyoming and Cabeza Prieta, Arizona
[E80-10050] N80-16398
Regional stochastic generation of streamflows using an ARIMA (1,0,1) process and disaggregation
[PB-300945/3] N80-16431

RIVERS
Application of transient-flow to the Sacramento River at Sacramento, California
[PB-301103/8] N80-16448
An analysis of the factors affecting the distribution of heavy metals in a tidal estuary N80-16573

ROCKET EXHAUST
Space shuttle base heating analysis
[NASA-CR-161375] N80-16089
Particle size measurements in solid propellant rocket exhaust plumes
[AD-A073556] N80-16096

ROCKET SOUNDING
Results of the August 1977 Soviet and American meterological rocketsonde intercomparison held at Wallops Island, Virginia
[NASA-RP-1053] N80-16682

ROCKS
Geology of precambrian metamorphic rocks of the Truchas Peaks area, north-central New Mexico N80-16526
Stratigraphy and sedimentology of the Upper Devonian Catskill and Uppermost Trimmers Rock formations in central Pennsylvania N80-16629

ROCKY MOUNTAINS (NORTH AMERICA)
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Rocky Mountain National Park
[PB-301334/9] N80-16430

ROLLER BEARINGS
Performance of computer-optimized tapered-roller bearings to 2.4 million DN
[NASA-TM-81414] N80-16342
Rotor-bearing dynamics technology design guide. Part 3: Tapered roller bearings
[AD-A074827] N80-16344
M-50 steel bearing material factors for rolling element life calculations
[AD-A074217] N80-16345

ROSSBY REGIMES
On the propagation of free topographic Rossby waves near continental margins
[PB-299949/8] N80-16704

ROTARY STABILITY
Active optimal control for suppression of whirl of a flexible centrifuge N80-16336

ROTARY WINGS
A comparison of calculated and experimental lift and pressure distributions for several helicopter rotor sections
[NASA-TM-81160] N80-16036

ROTATING BODIES
Predicting transition to turbulence in the compressible boundary layer flow over a spinning cone N80-16025
Terminal velocity and rotation rate of a flyer plate propelled by a tube-confined explosive charge N80-16229
Dynamic analysis of shells of revolution-soil systems N80-16368

ROTATING MIRRORS
Mirror position display equipment for the target chamber mirror mounts of the LASL Helios laser fusion facility
[LA-UR-79-569] N80-16894

ROTATION
Lateral and tilt whirl modes of flexibly mounted flywheel systems N80-16215

ROTOR AERODYNAMICS
WTG Energy Systems' rotor: Steel at 80 feet N80-16473

ROTOR BLADES (TURBOMACHINERY)
Design characteristics of the 234 kW Magdalen Islands VAWT N80-16463
Alcoa wind turbines N80-16464
Test results of the DOE/Sandia 17 meter VAWT N80-16465
WTG Energy Systems' rotor: Steel at 80 feet N80-16473
The use of wood for wind turbine blade construction N80-16474
The Boeing MOD-2 wind turbine system rotor N80-16477
Status of the Southern California Edison Company 3 MW Wind Turbine Generator (WTG) demonstration project N80-16478
System configuration improvement N80-16481
Experimental evaluation of active and passive means of alleviating rotor impulsive noise in descent flight
[NASA-CR-159188] N80-16839

ROTOR LIFT
A comparison of calculated and experimental lift and pressure distributions for several helicopter rotor sections
[NASA-TM-81160] N80-16036

ROTORS
Active optimal control for suppression of whirl of a flexible centrifuge N80-16336

ROUGHNESS
Losses caused by friction in straight pipes with systematic roughness elements
[ESDU-79014] N80-16268

RUBBER
Nitrogen dioxide vapor penetration of chlorobutyl rubber SCAPE under operational conditions
[NASA-TP-1605] N80-16118

RUBBER COATINGS
Phosphonitrilic fluoroelastomer coated fabrics for collapsible fuel storage tanks
[AD-A074824] N80-16167

RUNWAY LIGHTS
Optimum intensity setting of approach and runway light systems
[AD-A075485] N80-16046

RUNWAYS
Infrared runway collision avoidance system analysis --- carbon dioxide lasers
[AD-A078131] N80-16060

RUPTURING
Development of a standard methodology for the correlation and extrapolation of elevated temperature creep and rupture data. Volume 2: A state-of-the-art review
[EPRI-FP-1062-VOL-2] N80-16152

S

S MATRIX THEORY
Resonances in nuclear physics --- in light of S matrix theory N80-16864

S STARS
Relative isotopic abundances of zirconium in S-type stars N80-16991

SACRAMENTO VALLEY (CA)
Application of transient-flow to the Sacramento River at Sacramento, California
[PB-301103/8] N80-16448

SAFETY DEVICES
Evaluation of commercially available laser protective eyewear
[PB80-103039] N80-16741

SAFETY FACTORS
Assessment of environmental and safety problems in hydrogen energy systems
[LA-UR-79-583] N80-16186
Safety of liquid hydrogen in air transportation
[LA-UR-79-1416] N80-16236

SAFETY MANAGEMENT
Report of the FAA task force on aircraft separation assurance. Volume 1: Executive summary
[AD-A075352] N80-16050

SALINITY
Irrigation practices and return flow salinity in Grand Valley
[PB80-103609] N80-16416
Saltwater-barrier line in Florida: Concepts, considerations, and site examples
[PB80-101306] N80-16591

SALYUT SPACE STATION
Space vehicle approach procedures described
N80-16077

SANDSTONES
Petrology and stratigraphy of paleogene nonmarine sandstones, Cascade Range, Washington
N80-16638

SANDWICH STRUCTURES
Effect of temperature on composite sandwich structures subjected to low velocity impact --- aircraft construction materials
[NASA-CR-162718] N80-16103
On harmonic motion of sandwich plates
[AD-A074637] N80-16168

SATELLITE OBSERVATION
Illinois LANDSAT feasibility study
[NASA-CR-162760] N80-16424
The unique cosmic event of 1979 March 5
[NASA-TM-80630] N80-17012

SATELLITE SOUNDING
A comparison of GLAS SAT and NMC high resolution NOSAT forecasts from 19 and 11 February 1976
[NASA-TM-80591] N80-16678

SATELLITE-BORNE INSTRUMENTS
USSR Report: Space, no. 1
[JPRS-74605] N80-16075
Telemetry from orbit N80-16078

SCALE MODELS
Investigation of ground effects on large and small scale models of a three fan V/STOL aircraft configuration
[NASA-CR-152240] N80-16030

SCATTERING CROSS SECTIONS
Light scattering studies of solids and atomic vapors
[LBL-8222] N80-16173

SCATTERING FUNCTIONS
Radiative transfer modeling applied to sea water constituent determination --- Gulf of Mexico
[NASA-TM-72736] N80-16406

SCIENTISTS
Linking science and technology to public policy: The role of universities
[PB80-108202] N80-16934

SEA WATER
Pretreatment of seawater for reverse osmosis processes, 1976
[PB-300509/7] N80-16134
Radiative transfer modeling applied to sea water constituent determination --- Gulf of Mexico
[NASA-TM-72736] N80-16406
Saltwater-barrier line in Florida: Concepts, considerations, and site examples
[PB80-101306] N80-16591

SEALERS
Effectiveness of neoprene seals in preventing concrete pavement contraction joint deterioration
[PB-300594/9] N80-16244

SEALS (STOPPERS)
Some considerations of the performance of two honeycomb gas path seal material systems
[NASA-TM-81398] N80-16143
Program to develop sprayed, plastically deformable compressor shroud seal materials
[NASA-CR-159741] N80-16338
Continuous self-locking spiral wound seal --- for maintaining pressure between chambers in cryogenic wind tunnels
[NASA-CASE-LAR-12315-1] N80-16339

SEASAT SATELLITES
Verification procedures for the SEASAT measurements of the vector wind with the SASS
[NASA-CR-162469] N80-16407

SEASAT-A SATELLITE
The role of satellite altimetry in climate studies
[NASA-TP-1570] N80-16676

SECONDARY RADAR
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 1: Principles of operation
[AD-A074542] N80-16044
The Aircraft Reply and Interference Environment Simulator (ARIES). Volume 2: Appendices to the principles of operation
[AD-A074482] N80-16045

SEDIMENT TRANSPORT
Stratigraphy and sedimentology of the Upper Devonian Catskill and Uppermost Trimmers Rock formations in central Pennsylvania N80-16629
South Atlantic outer continental shelf geological studies, FY 1976
[PB-300822/4] N80-16701
South Atlantic outer continental shelf geological studies, FY 1976 --- sediment transport over the south Atlantic ocean bottom
[PB-300820/8] N80-16702

SEDIMENTARY ROCKS
Evolution of the late Pennsylvanian-early Permian western Oquirrh Basin, Utah N80-16627

SEDIMENTS
Measurement of eddy diffusivity and solute transport through the near-sediment boundary layer of ice-covered lakes, using Radon-222 N80-16390
Textural properties of surficial sediments of lower bay of New York harbor
[PB80-106479] N80-16592
Sediment characteristics of the 2800 meter Atlantic nuclear waste disposal site: Radionuclide retention potential
[PB-301255/6] N80-16871
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars
[NASA-TM-78254] N80-17004

SEISMIC WAVES
Analytical method for determining seismic response of cooling towers on footing foundations
[PB-301398/3] N80-16250
Investigation of seismic sources by the linear inversion of seismograms --- fracture mechanics
N80-16637
The effects of pore fluids and frictional sliding on seismic attenuation N80-16640
Probabilistic seismic stability analysis: A case study
[PB-301291/1] N80-16655
A probabilistic model for seismic slope stability analysis
[PB-301369/5] N80-16656
Soil structure interaction in different seismic environments
[PB80-101520] N80-16658
Earthquake waves in a random medium --- analyzed using mathematical models
[PB80-104862] N80-16662

SEISMOGRAPHS
Investigation of seismic sources by the linear inversion of seismograms --- fracture mechanics
N80-16637

SEISMOLOGY
Baseline correction of earthquake records in the frequency domain
[PB80-102056] N80-16659
Earthquake history of the United States, 1971 - 1976 supplement
[PB80-108434] N80-16661
ARMA models for earthquake ground motions
[PB-301166/5] N80-16667
Proceedings of the Second International Conference on Microzonation for Safer Construction: Research and application, volume 2
[PB-301144/2] N80-16668

SELECTIVE DISSEMINATION OF INFORMATION
CAB/cain evaluation project: A comparative study on the performance of two agricultural databases in a computerized current awareness service
[BLL-BLRDR-5483] N80-16941

SELF ADAPTIVE CONTROL SYSTEMS
Digital adaptive controllers for VTOL vehicles. Volume 1: Concept evaluation
[NASA-CR-159154-VOL-1] N80-16065
Digital adaptive controllers for VTOL vehicles. Volume 2: Software documentation
[NASA-CR-159154-VOL-2] N80-16066

SELF DIFFUSION (SOLID STATE)
Surface self-diffusion of germanium and silicon
[UCRL-82865] N80-16921

SEMICONDUCTOR DEVICES
Semiconductor measurement technology: Nondestructive tests used to insure the integrity of semiconductor devices, with emphasis on acoustic emission techniques
[PB80-101801] N80-16287

SEMICONDUCTOR JUNCTIONS
Planar multijunction high voltage solar cells
[NASA-TM-81389] N80-16914

SEMICONDUCTORS (MATERIALS)
Semiconductor grade, solar silicon purification project
[NASA-CR-162746] N80-16495
Theoretical studies of bound exciton decay and of transport across semiconductor interfaces
N80-16904
Devices for manufacture of microstructures, chips described N80-17017

SENSORIMOTOR PERFORMANCE
Multi-modal information processing for visual workload relief
[NASA-CR-162720] N80-16737

SEQUENTIAL ANALYSIS
Approximate confidence intervals for an exponential parameter from a sequential life test
[AD-A073897] N80-16360

SERVICE LIFE
Evaluation of the effectiveness of fabric reinforcement in extending the in-service life of bituminous concrete overlays
[PB-301305/9] N80-16248
Long life hydraulic brake system, summary
[PB80-104730] N80-16350

SET THEORY
Adaptation of set-defining notation to the specification of formal languages N80-16763
Transformational structure of algebraic logics
N80-16793
Using SETS to find minimal cut sets in large fault trees
[SAND-78-1943C] N80-16809

SEWAGE TREATMENT
Ultrafiltration of raw sewage using an immobilized enzyme membrane
[AD-A074804] N80-16951
Utilization of natural ecosystems for wastewater renovation
[PB80-100431] N80-16962

SHALE OIL
Groundwater quality monitoring of western oil shale development. Identification and priority ranking of potential pollution sources --- in eastern Utah
[PB-300536/0] N80-16623

SHALES
Study of hydrocarbon-shale interaction
[ORO-5197-14] N80-16409
Gas production of Devonian shale wells relative to photo lineament locations: A statistical analysis
[METC/CR-79/26] N80-16410

SHELLS (STRUCTURAL FORMS)
Dynamic analysis of shells of revolution-soil systems N80-16368

SHOCK ABSORBERS
Test evaluation of shock buffering concept for hydrodynamic ram induced by yawing projectile impacting a simulated integral fuel tank N80-16209
Liquid spring shock isolator modeling by system identification N80-16222

SHOCK LOADS
The Shock and Vibration Bulletin. Part 1: Invited papers, vibrations and acoustics, blast and shock
[NASA-CR-162471] N80-16198
Snaps in structures --- encountered in a solar array for a spacecraft N80-16204

SHOCK MEASURING INSTRUMENTS
Analog double integration of shock pulses
N80-16231

SHOCK SPECTRA
Shock spectra design methods for equipment-structure systems N80-16227

SHOCK TESTS
Shock response of non-linear systems
N80-16224
Analog double integration of shock pulses
N80-16231

SHOCK WAVE ATTENUATION
The effects of pore fluids and frictional sliding on seismic attenuation N80-16640

SHOCK WAVE PROPAGATION
Earthquake waves in a random medium --- analyzed using mathematical models
[PB80-104862] N80-16862
SHOCK WAVES
Earthquake waves in a random medium --- analyzed using mathematical models
[PB80-104862] N80-16862
SHORT HAUL AIRCRAFT
NASA quiet short-haul research aircraft experimenters' handbook
[NASA-TM-81162] N80-16024
SHRINKAGE
Shrinkage-compensating cement for airport pavement, phase 2
[AD-A075739] N80-16197
SIDELOBES
A spectral filter for ESMR's sidelobe errors
[NASA-TM-80555] N80-16402
SIERRA NEVADA MOUNTAINS (CA)
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10046] N80-16396
Investigation of the application of HCMM thermal data to snow hydrology --- Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397
SIEVES
Optical sieve comparator development project
[PB-300472/8] N80-16317
SIGNAL ANALYZERS
A statistical analysis for digital field strength data
[BBC-RD-1979/24] N80-16276
SIGNAL PROCESSING
Digital ultrasonic signal processing: Primary ultrasonics task and transducer characterization use and detailed description
[NASA-CR-161370] N80-16356
Identification, detection and validation of vibrating structures: A signal processing approach
[UCID-18270] N80-16383
Time integrating optical signal processing
N80-16975
SIGNAL TRANSMISSION
Satellite time transfer via Tracking and Data Relay Satellite System (TDRSS) and applications
[NASA-TM-80605] N80-16084
SIGNATURE ANALYSIS
Large Area Crop Inventory Experiment (LACIE). Detailed description of the wheat acreage estimation procedure used in the Large Area Crop Inventory Experiment
[E80-10051] N80-16299
SILICON
Cw laser annealing of ion implanted single crystal silicon N80-16320
Characterization of solar cells for space applications. Volume 11: Electrical characteristics of 2 ohm-cm, 229 micron wraparound solar cells as a function of intensity, temperature, and irradiation --- for solar electric propulsion
[NASA-CR-162686] N80-16488
Amorphous silicon thin film heterojunction solar cells
[SAN-1846-T3] N80-16496
Computer modelling of amorphous materials for photovoltaic conversion
[DOE/TIC-10165] N80-16526
Surface defects in weakly deformed single crystal silicon and their effect on interface properties of MOS capacitors N80-16913
Surface self-diffusion of germanium and silicon
[UCRL-82865] N80-16921
SILICON ALLOYS
Formation of supersaturated silicon by ion implantation and pulsed-laser annealing N80-16137
SILICON CARBIDES
Tribological properties of silicon carbide in metal removal process
[NASA-TM-79238] N80-16340
SILICON DIOXIDE
The reduction of silica and mullite in hydrogen --- kinetics, thermodynamics, and mass transport phenomena N80-16115
Apparatus and techniques for the study of precipitation of solids and silica from hypersaline geothermal brine
[UCRL-52799] N80-16127
SILICON POLYMERS
Semiconductor grade, solar silicon purification project
[NASA-CR-162746] N80-16495
SILVER NITRATES
A computational model describing the initiation of silver acetylide-silver nitrate explosive by an intense light source N80-16228
SIMULATION
Air traffic control/full beacon collision avoidance system, Knoxville simulation
[AD-A074555] N80-16043
SIMULATORS
Laser Doppler velocity simulator --- to induce frequency shift
[NASA-CASE-LAR-12176-1] N80-16321
SINE WAVES
On determining the number of dominant modes in sinusoidal structural response N80-16214
SINGLE CRYSTALS
Cw laser annealing of ion implanted single crystal silicon N80-16320
Low energy electron diffraction and auger electron spectroscopy studies of the structure and chemistry of iron single crystal surfaces N80-16902
Surface defects in weakly deformed single crystal silicon and their effect on interface properties of MOS capacitors N80-16913
Structural properties of NB3SN diffusion layers fabricated on single crystal Nb substrates
[AD-A074739] N80-16915
Equilibrium properties of the fluoxid lattice in single-crystal niobium
[CONF-790653-21] N80-16920
SINTERING
Sintering kinetics of pure and doped boron carbide
[UCRL-82515] N80-16108
Application of a diffusion model to oxide sintering
[PB-300399/3] N80-16238
SKIN (ANATOMY)
Development of percutaneous energy transmission systems
[PB-299739/3] N80-16731
Development of precutaneous energy transmission
[PB-300518/8] N80-16732
SKY RADIATION
Some fundamental considerations of the equation of radiative transfer
[ORO-3982-345] N80-16294
SKYLAB PROGRAM
The role of satellite altimetry in climate studies
[NASA-TP-1570] N80-16878
SLENDER WINGS
Means for controlling aerodynamically induced twist --- equipment to control twisting of slender wings due to aerodynamic loads
[NASA-CASE-LAR-12175-1] N80-16055
SLIDING FRICTION
Design of turbine blades for effective slip damping at high rotational speeds N80-16219
The effects of pore fluids and frictional sliding on seismic attenuation N80-16540
SLOPES
Probabilistic seismic stability analysis: A case study
[PB-301291/1] N80-16655
A probabilistic model for seismic slope stability analysis
[PB-301399/5] N80-16656
SLUSH
Producing slush oxygen with an auger and measuring the storage characteristics of slush hydrogen
[NASA-CR-158412] N80-16256
SMOG
Detailed characterization of gaseous and size resolved particulate pollutants at a south-coast air basin smog receptor site: levels and modes of formation of sulfate, nitrate and organic particulates and their implications for control strategies
[PB-301294/5] N80-16611
SNOW COVER
Relationship of physiography and snow area to stream discharge --- Kings River Watershed, California
[E80-10046] N80-16396
Investigation of the application of HCMM thermal data to snow hydrology --- Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397
Backscatter response of snow covered roads and roadside surfaces
[SAND-79-7046] N80-16413
SOCIAL FACTORS
Human service agency transportation coordination
[PB-300891/9] N80-16965
Transportation needs for the elderly, handicapped and low income of Mississippi
[PB-301273/9] N80-16971
SODIUM BROMIDES
Morphological and functional manifestations of rat adrenal-cortex response to sodium bromide administration under hypodynamic stress
[NASA-TM-7588] N80-16719
SOIL EROSION
Analysis of erosion and transportation features from lunar orbiter and Apollo photography
[NASA-CR-162703] N80-17005
SOIL MECHANICS
Variable modulus model for inelastic finite element analysis N80-16196
A study of highway embankment construction in South Carolina marshlands
[PB-300916/6] N80-16243
An evaluation of methodology for prediction and minimization of detrimental volume change of expansive soils in highway subgrades. Volume 1: Research report
[PB-301254/9] N80-16247
Chemical compaction aids for fine-grained soils, volume 1
[PB-301115/2] N80-16654
Probabilistic seismic stability analysis: A case study
[PB-301291/1] N80-16655
A probabilistic model for seismic slope stability analysis
[PB-301399/5] N80-16656
Soil structure interaction in different seismic environments
[PB80-101520] N80-16658
SOIL MOISTURE
The dielectric properties of soil-water mixtures at microwave frequencies
[NASA-TM-80597] N80-16403
L-band radar sensing of soil moisture --- Kern County, California
[NASA-TM-80629] N80-16404
Irrigation practices and return flow salinity in Grand Valley
[PB80-103808] N80-16416
SOIL SCIENCE
An evaluation of methodology for prediction and minimization of detrimental volume change of expansive soils in highway subgrades. Volume 1: Research report
[PB-301254/9] N80-16247
Soil fertility and soil loss constraints on crop residue removal for energy production
[SERI/RR-52-324] N80-16511
SOILS
Dynamic analysis of shells of revolution-soil systems N80-16368
Soil fertility and soil loss constraints on crop residue removal for energy production
[SERI/RR-52-324] N80-16511
Soil structure interaction in different seismic environments
[PB80-101520] N80-16658
SOLAR ACTIVITY
The influence of variations in ozone concentration on the temperature regime of the atmosphere
[NASA-TM-75350] N80-16649
SOLAR ARRAYS
Solar maximum mission panel jettison analysis remote manipulator system
[NASA-CR-162498] N80-16073
Snaps in structures --- encountered in a solar array for a spacecraft N80-16204
Evaluation of concentrated space solar arrays using computer modeling --- for spacecraft propulsion and power supplies
[NASA-CR-162991] N80-16487
Semiconductor grade, solar silicon purification project
[NASA-CR-162746] N80-16495
Low-cost structures for photovoltaic arrays
[SAND-79-7006] N80-16537

SOLAR CELLS
The interface state effects and characterization of MIS solar cells --- describing the charge carrier mechanisms and electron tunneling behavior
N80-16451
Characterization of solar cells for space applications. Volume 11: Electrical characteristics of 2 ohm-cm, 228 micron wraparound solar cells as a function of intensity, temperature, and irradiation --- for solar electric propulsion
[NASA-CR-162686] N80-16486
Diffusion length measurements of thin GaAs solar cells by means of energetic electrons
[NASA-CR-162692] N80-16489
Amorphous silicon thin film heterojunction solar cells
[SAN-1846-T3] N80-16496
Federal photovoltaics utilization program
[DOE/EA-0087] N80-16525
Emerging material systems for solar cell applications
[DOE/ET-23003/1] N80-16533
Carrier transport through heterojunction solar cells
[DOE/ET/23103-5] N80-16534
Photovoltaic effect, its present understanding and remaining mysteries
[DOE/ET/23103-6] N80-16535
Photovoltaic Materials and Device Measurements Workshop: Focus on polycrystalline thin film cells
[SERI/TP-49-185] N80-16538
Planar multijunction high voltage solar cells
[NASA-TM-81389] N80-16914

SOLAR COLLECTORS
Outdoor test for thermal performance evaluation of the Owens-Illinois Sunpack SEC-601 (air) solar collector
[NASA-CR-161339] N80-16492
Characterization of crushed glass as a transpired air heating solar collector material
[LA-UR-79-1336] N80-16498
Solar collector manufacturing activity
[DOE/EIA-0174/78] N80-16500
Fixed mirror solar concentrator for application to a 100 MW(e) electric generating plant
[GA-A-15340] N80-16508
Solar energy concentrator design and operations. Citations from the NTIS data base
[NTIS/PS-79/0926/0] N80-16557
Solar energy concentrator design and operations. Citations from the Engineering Index data base
[NTIS/PS-79/0927/8] N80-16558
Addition of an air-cooled collector test capability to the solar collector test facility
[PB-300482/7] N80-16562
Flat plate solar collector design and performance. Citations from the NTIS data base
[NTIS/PS-79/0928/6] N80-16566
Flat plate solar collector design and performance. Citations from the Engineering Index data base
[NTIS/PS-79/0929/4] N80-16567
Performance of a packaged solar space-heating system used with a mobile home
[PB-300890/1] N80-16572

SOLAR COOLING
Prototype solar heating and combined heating cooling systems
[NASA-CR-161340] N80-16485
Outdoor test for thermal performance evaluation of the Owens-Illinois Sunpack SEC-601 (air) solar collector
[NASA-CR-161339] N80-16492
Commercial prototype design of a solar heating/cooling system for a manufactured home
[TREE-1384] N80-16520
Solar-MEC development program, project 9103
[COO-4495-7] N80-16522
Federal demonstrations of solar heating and cooling on private residences: Only limited success
[PB-301123/6] N80-16555

SOLAR CORPUSCULAR RADIATION
Energy release in solar flares. Proceedings of the workshop on Energy Release in Flares
[PB-300905/7] N80-17010

SOLAR ELECTRIC PROPULSION
Computed voltage distributions around solar electric propulsion spacecraft
[NASA-TM-79286] N80-16094
Characterization of solar cells for space applications. Volume 11: Electrical characteristics of 2 ohm-cm, 228 micron wraparound solar cells as a function of intensity, temperature, and irradiation --- for solar electric propulsion
[NASA-CR-162686] N80-16486

SOLAR ENERGY
Comparative analysis of solar energy storage cycles
[SAND-79-1803C] N80-16516
Preparation of thin films for solar energy utilization
[SAND-79-1754C] N80-16517
Preliminary experimental results on the optical properties of model direct solar gain interiors
[ISM-233] N80-16519
Continuing regional solar energy information mini-center activities and updating the SOLCOST program
[COO-4643-T2] N80-16521
Solar central test facility
[SAND-79-1730C] N80-16524
Solar energy for agriculture: Review of research
[PB-298688/3] N80-16568
Solar powered agricultural irrigation pumping
[PB-299294/9] N80-16570

SOLAR ENERGY ABSORBERS
Aluminium or copper substrate panel for selective absorption of solar energy
[NASA-CASE-MFS-23518-3] N80-16452

SOLAR ENERGY CONVERSION
A 15kWe (nominal) solar thermal electric power conversion concept definition study: Steam Rankine reheat reciprocator system
[NASA-CR-159590] N80-16491
The 15 kW sub e (nominal) solar thermal electric power conversion concept definition study: Steam Rankine turbine system
[NASA-CR-159589] N80-16493
Use of solar energy for the production of electricity in the Alps
[SAND-79-6000] N80-16499
Solar photovoltaic field tests and applications project
[COO-4094-26] N80-16512
Objectives and strategies of the International Photovoltaic Program Plan
[SERI/TR-52-250] N80-16513
Proceedings: Photovoltaics user Review Panel
[SERI/TP-69-276] N80-16514
Solar central test facility
[SAND-79-1730C] N80-16524
Organic photochemical storage of solar energy
[COO-4380-2] N80-16527
Midtemperature solar systems test facility experiment manual and test plan
[SAND-79-0379] N80-16528
Performance characteristics of a commercially available point-focus solar power --- systems analysis of a solar energy conversion system in terms of power efficiency and energy conversion efficiency
[SERI/TP-34-169] N80-16529
Solar energy concentrator design and operations. Citations from the NTIS data base
[NTIS/PS-79/0926/0] N80-16557
Solar energy concentrator design and operations. Citations from the Engineering Index data base
[NTIS/PS-79/0927/8] N80-16558
Flat plate solar collector design and performance. Citations from the NTIS data base
[NTIS/PS-79/0928/6] N80-16566
Flat plate solar collector design and performance. Citations from the Engineering Index data base
[NTIS/PS-79/0929/4] N80-16567
Heliostat system design and operation. Citations from the Engineering Index data base
[NTIS/PS-79/0930/2] N80-16571

SOLAR FLARES
The mechanism of temperature and pressure changes in the Earth's atmosphere during solar flares
[NASA-TM-75349] N80-17007
Very Large Array (VLA) observations of solar active regions
[AD-A066780] N80-17009
Energy release in solar flares. Proceedings of the workshop on Energy Release in Flares
[PB-300905/7] N80-17010

SOLAR GENERATORS
Study of advanced radial outflow turbine for solar steam Rankine engines
[NASA-CR-159695] N80-16483
A 15kWe (nominal) solar thermal electric power conversion concept definition study: Steam Rankine reheat reciprocator system
[NASA-CR-159590] N80-16491

SOLAR HEATING
Prototype solar heating and combined heating cooling systems
[NASA-CR-161340] N80-16485
Characterization of crushed glass as a transpired air heating solar collector material
[LA-UR-79-1336] N80-16498
Computer simulation of ground coupled storage in a series solar assisted heat pump system
[BNL-26216] N80-16507
Solar availability for winter space heating: An analysis of the calendar period 1953-1975
[ANL/SPG-14] N80-16532
Federal demonstrations of solar heating and cooling on private residences: Only limited success
[PB-301123/6] N80-16555
Performance of a packaged solar space-heating system used with a mobile home
[PB-300890/1] N80-16572

SOLAR HOUSES
Outdoor test for thermal performance evaluation of the Owens-Illinois Sunpack SEC-601 (air) solar collector
[NASA-CR-161339] N80-16492
Performance evaluation of the New Mexico State University solar house
[PB-301225/9] N80-16553
Performance of a packaged solar space-heating system used with a mobile home
[PB-300890/1] N80-16572

SOLAR INSTRUMENTS
Very Large Array (VLA) observations of solar active regions
[AD-A066780] N80-17009

SOLAR MAXIMUM MISSION
Mission operation report. Solar Maximum Mission (SMM)
[NASA-TM-80939] N80-16072
Solar maximum mission panel jettison analysis remote manipulator system
[NASA-CR-162466] N80-16073

SOLAR PHYSICS
Very Large Array (VLA) observations of solar active regions
[AD-A066780] N80-17009

SOLAR POSITION
Solar altitude effects on ice Albedo
[PB-301252/3] N80-16440

SOLAR POWER SATELLITES
Solar power satellite system definition study, phase 2. Volume 2: Reference system description
[NASA-CR-160443] N80-16086
Satellite Power System (SPS)
[NASA-TM-80943] N80-16484

SOLAR RADIATION
Input data for solar systems
[DOE/TIC-10193-REV-1] N80-16504
Normal incident solar radiation measurements at Upton, New York
[BNL-50939] N80-16653

SOLAR RADIO EMISSION
Very Large Array (VLA) observations of solar active regions
[AD-A066780] N80-17009

SOLAR SAILS
Strong thin membrane structure --- solar sails
[NASA-CASE-NPO-14021-2] N80-16163

SOLAR SPECTRA
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 1: Estimate of the electron velocity distribution functions
[NASA-CR-162696] N80-16851

SOLAR TERRESTRIAL INTERACTIONS
The mechanism of temperature and pressure changes in the Earth's atmosphere during solar flares
[NASA-TM-75349] N80-17007

SOLAR TOTAL ENERGY SYSTEMS
Decentralized energy: Technology assessment and systems description
[BNL-50987] N80-16502

Environmental development plan: Solar thermal power systems
[DOE/EDP-0035] N80-16503
Performance evaluation of the New Mexico State University solar house
[PB-301225/9] N80-16553

SOLAR WIND
Lunar magnetism and plasma interactions
N80-16999
Analysis of solar wind data from the SOLRAD 11A and 11B spacecraft
[AD-A070945] N80-17008

SOLID ROCKET PROPELLANTS
Particle size measurements in solid propellant rocket exhaust plumes
[AD-A073556] N80-16098

SOLID WASTES
Preliminary assessment of the prospects for use of refuse-derived fuel in Maryland
[BNL-51065] N80-16179
Analysis of airborne viable bacteria at solid waste processing facilities
[PB80-102338] N80-16590
Refractory particles in cullet recovered from municipal refuse
[PB-300523/8] N80-16597
Design and construction of covers for solid waste landfills
[PB80-100381] N80-16958

SOLIDIFIED GASES
Producing slush oxygen with an auger and measuring the storage characteristics of slush hydrogen
[NASA-CR-158412] N80-16256

SOLIDS
Tensile cracks in creeping solids
[COO-3084-64] N80-16388

SOLITARY WAVES
Soliton masses in supersymmetric theories
[COO-1764-363] N80-16928

SOLUBILITY
Determination of water solubility in organic liquids
[RHO-SA-113] N80-16099
Hydrogen diffusion, dissolution and permeation of nonmetallic solids
[ORO-4721-T1] N80-16124

SOLUTES
Measurement of eddy diffusivity and solute transport through the near-sediment boundary layer of ice-covered lakes, using Radon-222 N80-16390

SOUND FIELDS
Spherical harmonic analysis and some applications to surround sound
[BBC-RD-1979/25] N80-16831

SOUND PROPAGATION
An examination of coupled mode theory as applied to underwater sound propagation N80-16832
Evaluation of the attenuation of broad-band sound by a non-uniform still atmosphere
[ESDU-78003-A] N80-16836
Propagation of sound through the atmosphere: Effects of ground cover 2
[AD-A073262] N80-16840

SOUND TRANSMISSION
Spherical harmonic analysis and some applications to surround sound
[BBC-RD-1979/25] N80-16831

SOUNDING
A case study of height and temperature analyses derived from Nimbus-6 satellite soundings on a fine mesh model grid N80-16642
AVE-SESAME 1: 25-MB sounding data
[NASA-TM-78256] N80-16653

SOUTH CAROLINA
A study of highway embankment construction in South Carolina marshlands
[PB-300816/6] N80-16243

SOUTHERN CALIFORNIA
Status of the Southern California Edison Company 3 MW Wind Turbine Generator (WTG) demonstration project N80-16478

SOYBEANS
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394

SOYUZ SPACECRAFT
Space vehicle approach procedures described
N80-16077

SPACE ERECTABLE STRUCTURES
Study of foldable elastic tubes for large space structure applications, phase 1
[NASA-CR-162652] N80-16083

SPACE EXPLORATION
USSR Report: Space, no. 1
[JPRS-74805] N80-16075

SPACE HEATING (BUILDINGS)
Solar availability for winter space heating: An analysis of the calendar period 1953-1975
[ANL/SPG-14] N80-16532
Federal demonstrations of solar heating and cooling on private residences: Only limited success
[PB-301123/6] N80-16555
Feasibility study of geothermal energy for heating greenhouses
[PB-299517/3] N80-16569
Performance of a packaged solar space-heating system used with a mobile home
[PB-300890/1] N80-16572

SPACE MANUFACTURING
Manufacturing in space. Citations from the International Aerospace Abstracts data base --- bibliographies
[NTIS/PS-79/1053/2] N80-16074

SPACE PROGRAMS
A grouped binary time code for telemetry and space applications
[NASA-TM-80606] N80-16090

SPACE SHUTTLE BOOSTERS
Space shuttle solid rocket booster aft skirt reentry noise induced by an aerodynamic cavity-flow interaction N80-16203

SPACE SHUTTLE ORBITERS
Evaluation of use of MPAD trajectory tape and number of orbit points for orbiter mission thermal predictions
[NASA-TM-80946] N80-16081
Orbiter landing loads math model description and correlation with ALT flight data
[NASA-RP-1056] N80-16091
The development of a method for predicting the noise exposure of payloads in the space shuttle orbiter vehicle N80-16199

SPACE SHUTTLE PAYLOADS
The development of a method for predicting the noise exposure of payloads in the space shuttle orbiter vehicle N80-16199
An impedance technique for determining low frequency payload environments --- Space Transportation System N80-16212

SPACE SHUTTLES
Optimum reentry trajectories of a lifting vehicle
[NASA-CR-3236] N80-16080
Space shuttle operational planning, policy and legal issues
[GPO-53-649] N80-16088
Space shuttle base heating analysis
[NASA-CR-161375] N80-16089

SPACE TRANSPORTATION SYSTEM
Space shuttle operational planning, policy and legal issues
[GPO-53-649] N80-16088
An impedance technique for determining low frequency payload environments --- Space Transportation System N80-16212

SPACE TRANSPORTATION SYSTEM 1 FLIGHT
Evaluation of use of MPAD trajectory tape and number of orbit points for orbiter mission thermal predictions
[NASA-TM-80946] N80-16081

SPACEBORNE ASTRONOMY
EUV observations of the local ism N80-16982

SPACEBORNE PHOTOGRAPHY
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Yellowstone National Park
[PB-301333/1] N80-16429
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Rocky Mountain National Park
[PB-301334/9] N80-16430
Atlas of Mars: The 1:5000000 map series
[NASA-SP-438] N80-16998
Voyager 1: Encounter with Jupiter
[NASA-CR-162721] N80-17003

SPACEBORNE TELESCOPES
Characteristics of the telescope for high energy gamma-ray astronomy selected for definition studies on the gamma ray observatory
[NASA-TM-80590] N80-16987

SPACECRAFT CHARGING
Effects of secondary yield parameter variation on predicted equilibrium potential of an object in a charging environment --- using computerized simulation
[NASA-TM-79299] N80-16093
Computed voltage distributions around solar electric propulsion spacecraft
[NASA-TM-79286] N80-16094

SPACECRAFT COMMUNICATION
Antenna feed system for receiving circular polarization and transmitting linear polarization
[NASA-CASE-NPO-14362-1] N80-16261

SPACECRAFT COMPONENTS
On the use of coherence functions to evaluate sources of dynamic excitation N80-16201

SPACECRAFT CONSTRUCTION MATERIALS
Trends in materials' outgassing technology
[NASA-TM-80585] N80-16117

SPACECRAFT CONTAMINATION
Trends in materials' outgassing technology
[NASA-TM-80585] N80-16117

SPACECRAFT CONTROL
Control of large space structures
[NASA-CR-161369] N80-16082
Research study: Space vehicle control systems
[NASA-CR-161368] N80-16092

SPACECRAFT DOCKING
USSR Report: Space, no. 1
[JPRS-74805] N80-16075

SPACECRAFT LANDING
Orbiter landing loads math model description and correlation with ALT flight data
[NASA-RP-1056] N80-16091

SPACECRAFT MOTION
A statistical look at modal displacement response to sequential excitations --- vibratory pointing error
N80-16213

SPACECRAFT POWER SUPPLIES
Solar power satellite system definition study, phase 2. Volume 2: Reference system description
[NASA-CR-160443] N80-16086
Sealed-cell nickel-cadmium battery applications manual
[NASA-RP-1052] N80-16095
Evaluation of concentrated space solar arrays using computer modeling --- for spacecraft propulsion and power supplies
[NASA-CR-162681] N80-16487

SPACECRAFT PROPULSION
Upper stages utilizing electric propulsion
[NASA-TM-81412] N80-16097
Evaluation of concentrated space solar arrays using computer modeling --- for spacecraft propulsion and power supplies
[NASA-CR-162681] N80-16487

SPARK IGNITION
Combustion optimization studies for stratified charge and diesel engines
[COO-4191-2] N80-16346

SPATIAL DISTRIBUTION
NCMART: Algorithms and computer codes for a modified algebraic spatial reconstruction of spectroscopic emissivities for ELMO bumpy torus
[ORNL/TM-6500] N80-16896

SPECIFICATIONS
The Boeing MOD-2 wind turbine system rotor
N80-16477

SPECTRAL BANDS
Spectral peak amplitude coding for voice data compression --- the coding of speech spectral bands for voice data processing N80-16258

SPECTRAL EMISSION
Radiation from Ag and K film bombarded by low energy electrons
[ORNL/TM-6527] N80-16859

SPECTRAL REFLECTANCE
Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types --- San Juan Mountains, Colorado
[E80-10041] N80-16391
Geologic application of thermal-inertia mapping from satellite --- Powder River Basin, Wyoming and Cabeza Prieta, Arizona
[E80-10050] N80-16398

SPECTRAL SIGNATURES
Computer-aided processing of LANDSAT MSS data for classification of forestlands --- San Juan Mountains, Colorado
[E80-10043] N80-16393
Large Area Crop Inventory Experiment (LACIE). The boundary pixel study in Kansas and North Dakota
[E80-10044] N80-16394
Large Area Crop Inventory Experiment (LACIE). Detailed description of the wheat acreage estimation procedure used in the Large Area Crop Inventory Experiment
[E80-10051] N80-16399
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400
SPECTROSCOPIC ANALYSIS
Environmental particulates: Characterization by helium plasma and elucidation of formation processes N80-16110
SPECTRUM ANALYSIS
Theoretical studies of excess electron mobilities and change-transfer spectra N80-16841
An investigation of the properties of close multiple stars --- by analysis of the stellar spectra N80-16983
H 2 region-like galaxies --- analysis of hydrogen line spectra in galaxies N80-16995
SPEECH
Spectral peak amplitude coding for voice data compression --- the coding of speech spectral bands for voice data processing N80-16258
SPHERES
Blast from bursting frangible pressure spheres N80-16208
SPHERICAL HARMONICS
Spherical harmonic analysis and some applications to surround sound
[BBC-RD-1979/25] N80-16831
SPHERICAL WAVES
Interior Reissner-Nordstrom black holes N80-16976
SPILLING
Remote sensing for diagnosing vapor dispersion in spills of liquid energy fuels
[UCID-18237] N80-16408
SPIN TESTS
Spin test of the University of California, Lawrence Livermore Laboratory composite flywheel at the Applied Physics laboratory, The Johns Hopkins University, on 18 July 1978
[UCRL-13910] N80-16544
SPIN-LATTICE RELAXATION
The simple atomic hopping problem. Particle correlation functions with application to dipolar induced spin lattice relaxation N80-16850
SPIN-SPIN COUPLING
The temperature and density dependence of the nuclear spin-spin interaction in HD gas and fluid N80-16846
SPIRAL WRAPPING
Continuous self-locking spiral wound seal --- for maintaining pressure between chambers in cryogenic wind tunnels
[NASA-CASE-LAR-12315-1] N80-16339
SPLINE FUNCTIONS
FORTRAN subroutines for bicubic spline interpolation
[ORNL/CSD/TM-67] N80-16777
SQUARE WAVES
Theoretical and experimental square wave voltammetry N80-16273
STABILIZED PLATFORMS
A survey of airborne radar systems for deployment on a High Altitude Powered Platform (HAPP)
[NASA-CR-156860] N80-16264
STABILIZERS (AGENTS)
Chemical compaction aids for fine-grained soils, volume 1
[PB-301115/2] N80-16654
STAINLESS STEELS
Corrosion behavior of Ni implanted steel N80-16138
Biaxial creep-fatigue behavior of type 316h stainless steel tube
[ANL-79-33] N80-16146
Deformation hardening of type 304 stainless steel at elevated temperature
[CONF-790801-4] N80-16147
Consistent creep and rupture properties for creep-fatigue evaluation --- stainless steels
[CONF-781202-21] N80-16387
STANDARD DEVIATION
Tests for normality and symmetry N80-16816
STANDARDS
Standard reference materials: Micro-homogeneity studies of NBS standard reference materials, NBS research materials, and other related samples
[PB-300461/1] N80-16135
Research related to the expansion and improvement of human vibration exposure criteria N80-16217
STAR CLUSTERS
An investigation of the properties of close multiple stars --- by analysis of the stellar spectra N80-16983
STARS
Radio astronomical observations of regions of star formation N80-16979
An investigation of the properties of close multiple stars --- by analysis of the stellar spectra N80-16983
STATIC ELECTRICITY
Calculation of local fields in cubic lattices of polarizable atoms N80-16907
STATIC LOADS
Assembly of interference fits by impact and constant force methods
[PB-301289/5] N80-16351
Design equation for tripping of stiffeners under in plane and lateral loads
[AD-A074752] N80-16379
STATIONKEEPING
A survey of airborne radar systems for deployment on a High Altitude Powered Platform (HAPP)
[NASA-CR-156860] N80-16264
STATISTICAL ANALYSIS
A statistical look at modal displacement response to sequential excitations --- vibratory pointing error N80-16213
A statistical analysis for digital field strength data
[BBC-RD-1979/24] N80-16276
Turbulent dusty gas motions with weak statistical coupling
[UCRL-82131] N80-16307
Statistical analysis of absorptive laser damage in dielectric thin films
[UCRL-81670] N80-16325
Gas production of Devonian shale wells relative to photo lineament locations: A statistical analysis
[METC/CR-79/26] N80-16410
Collection and analysis of vegetative cover data --- Hanford Site, Washington
[PNL-3068] N80-16412
Qualitative study of nonlinear problems in analysis
[AD-A074017] N80-16807
Spectral estimation for a randomly sampled time-series N80-16814
Robust confidence intervals for the one- and two-sample problems N80-16817
Statistical analysis of the interrupted time-series experiment: Some problems and a recommended solution
[CONF-791043-1] N80-16822
Statistical bases of relevance assessment for the ideal information retrieval test collection
[BLL-BLRDR-5481] N80-16939
Some statistical indicators of UK abstracting and indexing services
[BL-BLLRDR-5488] N80-16942
STATISTICAL CORRELATION
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16677
STATISTICAL MECHANICS
Statistical mechanics and field theory N80-16924
STATISTICAL TESTS
Tests for normality and symmetry N80-16816
Robust confidence intervals for the one- and two-sample problems N80-16817
Statistical analysis of the interrupted time-series experiment: Some problems and a recommended solution
[CONF-791043-1] N80-16822
STEADY STATE
Steady state response of a circular foundation on a transversely isotopic medium N80-16369
STEAM TURBINES
Simulation of MHD and steam cycle facility
[DOC-80SDS006] N80-16450
Study of advanced radial outflow turbine for solar steam Rankine engines
[NASA-CR-159695] N80-16483
The 15 kW sub e (nominal) solar thermal electric power conversion concept definition study: Steam Rankine turbine system
[NASA-CR-159589] N80-16493
STEEL STRUCTURES
Biaxial creep-fatigue behavior of type 316h stainless steel tube
[ANL-79-33] N80-16146
Heavy-section steel technology program --- for liquid cooled reactor materials
[NUREG-CR-0818] N80-16235
Investigation of the nonlinear characteristics of a three story steel frame using system
[PB-301363/8] N80-16253
Design, fabrication, and test of a steel spar wind turbine blade N80-16472
WTG Energy Systems' rotor: Steel at 80 feet N80-16473
The MOD-1 steel blade N80-16476
STEELS
M-50 steel bearing material factors for rolling element life calculations
[AD-A074217] N80-16345
STEEPEST DESCENT METHOD
Numerical inversion of Laplace transforms
[AD-A074438] N80-16802
STELLAR ATMOSPHERES
X-ray observations of a compact binary source
[NASA-CR-162750] N80-16989
Treatment of molecular absorption by use of transmission average opacities in cool stellar atmosphere models N80-16996
STELLAR ENVELOPES
A study of hydroxyl masers in the circumstellar envelopes of long period variable stars N80-16985
Heterodyne spatial interferometry of circumstellar dust shells at a wavelength of 11 microns N80-16992
STELLAR EVOLUTION
Radio astronomical observations of regions of star formation N80-16979
Helium runaways in white dwarfs
[NASA-CR-162694] N80-16986
STELLAR MASS ACCRETION
Helium runaways in white dwarfs
[NASA-CR-162694] N80-16986
UBVR observation of V1357 Cyg = Cyg X-1. Search of the optical radiation of the accretion disk
[NASA-TM-75677] N80-16988
STELLAR MASS EJECTION
Mass loss from cataclysmic variable secondaries N80-16994
STELLAR MODELS
Treatment of molecular absorption by use of transmission average opacities in cool stellar atmosphere models N80-16996
STELLAR RADIATION
UBVR observation of V1357 Cyg = Cyg X-1. Search of the optical radiation of the accretion disk
[NASA-TM-75677] N80-16988
STELLAR SPECTRA
Spectrophotometry of ring nebulae around Wolf-Rayet stars N80-16980
An investigation of the properties of close multiple stars --- by analysis of the stellar spectra N80-16983
STELLAR SPECTROPHOTOMETRY
Spectrophotometry of ring nebulae around Wolf-Rayet stars N80-16980
STELLAR STRUCTURE
Relative isotopic abundances of zirconium in S-type stars N80-16991
STIFFENING
Design equation for tripping of stiffeners under in plane and lateral loads
[AD-A074752] N80-16379
STOCHASTIC PROCESSES
Regional stochastic generation of streamflows using an ARIMA (1,0,1) process and disaggregation
[PB-300945/3] N80-16431
Prospects for monthly forecasts with 3-D global weather models
[UCRL-82548] N80-16694

Linear and nonlinear stochastic operators N80-16813
Stochastic filtering and control [AD-A074258] N80-16820
A stochastic approach to ultrasonic tissue characterization N80-16834

STORAGE STABILITY
Stability studies of coal liquids [PETC/TR-79/5] N80-16129

STORAGE TANKS
Static tilt test of a tall cylindrical liquid storage tank [PB-301167/3] N80-16255

STRAIN HARDENING
The effects of strain rate and strain history on the dynamic behavior of metallic materials N80-16140

STRAIN RATE
The effects of strain rate and strain history on the dynamic behavior of metallic materials N80-16140

STRATIFIED FLOW
The motion of a vortex pair in a stratified medium N80-16026

STRATIGRAPHY
Subsurface stratigraphy of the Middle and Upper Devonian clastic sequence in southern West Virginia and its relation to gas production N80-16628
Stratigraphy and sedimentology of the Upper Devonian Catskill and Uppermost Trimmers Rock formations in central Pennsylvania N80-16629
Petrology and stratigraphy of paleogene nonmarine sandstones, Cascade Range, Washington N80-16638
The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars [NASA-TM-78254] N80-17004

STRATOSPHERE
A catalog of perturbing influences on stratospheric ozone, 1955-1975 [AD-A063650] N80-16646
Report on the progress of regulations to protect stratospheric ozone [PB-301368/7] N80-16665

STRATUS CLOUDS
Stability of a turbulent layer cloud within the planetary boundary layer N80-16641
Numerical simulation of the formation and dissipation of stratus cloud under an inversion N80-16673

STREAMS
Toward classification and rationale for watershed management and stream protection [PB80-103153] N80-16417
Quaternary stream terraces in the northwestern Sacramento Valley, Glenn, Tehama, and Shasta Counties, California N80-16631

STRESS (PHYSIOLOGY)
Glucose metabolism in different regions of the rat brain under hypokinetic stress influence [NASA-TM-75949] N80-16718
Morphological and functional manifestations of rat adrenal-cortex response to sodium bromide administration under hypodynamic stress [NASA-TM-7593] N80-16719
Effect of gravitation stress and hypokinesia on blood vessels of the testicle [NASA-TM-75942] N80-16726
A study of occupational heat stress by analysis of environmental and human factors N80-16735

STRESS ANALYSIS
Prediction of fiber composite mechanical behavior made simple -- using a rocket calculator [NASA-TM-81404] N80-16107
Static tilt test of a tall cylindrical liquid storage tank [PB-301167/3] N80-16255
Stress singularities at the corners of a semi-infinite strip N80-16370
The use of stress change experiments to study the mechanisms of elevated temperature deformation N80-16371
Surface defects in weakly deformed single crystal silicon and their effect on interface properties of MOS capacitors N80-16913

STRESS CONCENTRATION
Elastic stress concentration factors: Rectangular notch in the edge of a wide flat plate in tension [ESDU-79008] N80-16372
Influences of the couple-stresses on the pure-bending of a circular cylinder [GA-A-15141] N80-16385

STRESS CORROSION CRACKING
Stress corrosion cracking evaluation of martensitic precipitation hardening stainless steels [NASA-TM-78257] N80-16142
Elastic and plastic strains and the stress corrosion cracking of austenitic stainless steels [COO-2576-9] N80-16144
Localized corrosion and stress corrosion cracking behavior of austenitic stainless steel weldments containing retained ferrite [COO-2462-5] N80-16149

STRESS MEASUREMENT
Acoustoelastic analysis of center-cracked panels N80-16367
Operational experience with VAWT blades --- structural performance N80-16468

STRESS WAVES
A simplified method of evaluating the stress wave environment of internal equipment N80-16205

STRESS-STRAIN RELATIONSHIPS
A generalized derivative model for an elastomer damper N80-16223
Inelastic shear stresses and strains in the adhesives bonding lap joints loaded in tension or shear (computer program) --- used in aircraft wing, fuselage, and furnishing components [ESDU-79016] N80-16363

STRINGERS
Initial imperfection measurements of integrally Stringer-stiffened cylindrical shells [TAE-330] N80-16374

STRIP
Stress singularities at the corners of a semi-infinite strip N80-16370

STRIP MINING
Evaluation of the environmental effects of western surface coal mining. Volume 2: Mine inventory [PB-301249/9] N80-16621

STRUCTURAL ANALYSIS
A simplified method of evaluating the stress wave environment of internal equipment N80-16205
A stability theorem for a dynamically loaded linear viscoelastic structure N80-16230
Probabilistic analysis of temperature loads for structures, structural loads analysis and specifications project [PB-301415/6] N80-16251
Finite-element analysis of laminated biomodulus composite-material plates [AD-A074184] N80-16376
Investigation of the suitability of the Bazant endochronic material model for modelling the concrete in a SAMSON analysis of a reinforced concrete beam [AD-A074202] N80-16377
Operational experience with VAWT blades --- structural performance N80-16468
Structural analysis considerations for wind turbine blades N80-16469

STRUCTURAL BASINS
Evolution of the late Pennsylvanian-early Permian western Oquirrh Basin, Utah N80-16627
Preliminary geologic appraisal and economic aspects of the Precambrian basement of Iowa N80-16633

STRUCTURAL DESIGN
Design equation for tripping of stiffeners under in plane and lateral loads [AD-A074752] N80-16379
Design evolution of large wind turbine generators N80-16455
The General Electric MOD-1 wind turbine generator program N80-16456
The Boeing MOD-2 wind tunnel system rated at 2.5 MW N80-16457
Structural analysis considerations for wind turbine blades N80-16469
Design, fabrication, and test of a steel spar wind turbine blade N80-16472
System configuration improvement N80-16481
Low-cost structures for photovoltaic arrays [SAND-79-7006] N80-16537
Confirmatory analysis and detail design of the magnet system for Mirror Fusion Test Facility (MFTF) [UCRL-13923] N80-16893

STRUCTURAL DESIGN CRITERIA
Alcoa wind turbines N80-16464
Large, low cost composite wind turbine blades N80-16475

STRUCTURAL ENGINEERING
Dipole broadside glide slope array --- for landing systems [AD-A077042] N80-16047
Study of foldable elastic tubes for large space structure applications, phase 1 [NASA-CR-162652] N80-16083
Research study: Space vehicle control systems [NASA-CR-161368] N80-16092
Fabrication of extruded vertical axis turbine blades N80-16467
The use of wood for wind turbine blade construction N80-16474
The MOD-1 steel blade N80-16476
The Boeing MOD-2 wind turbine system rotor N80-16477
Design, fabrication and testing of the air-jet oil boom [PB80-102635] N80-16593

STRUCTURAL MEMBERS
Low-cost structures for photovoltaic arrays [SAND-79-7006] N80-16537

STRUCTURAL PROPERTIES (GEOLOGY)
Gas production of Devonian shale wells relative to photo lineament locations: A statistical analysis [METC/CR-79/28] N80-16410
Geology of the Acarigua area, Venezuela N80-16630
Bibliography of geology and hydrology, eastern New Mexico [PB-300832/3] N80-16663

STRUCTURAL RELIABILITY
Limitations and corrections in measuring dynamic characteristics of structural systems [SAND-78-1015] N80-16386

STRUCTURAL STABILITY
Snaps in structures --- encountered in a solar array for a spacecraft N80-16204
A stability theorem for a dynamically loaded linear viscoelastic structure N80-16230
Effect of subbase type and subsurface drainage on behavior of CRC pavements [PB80-101165] N80-16240

STRUCTURAL VIBRATION
A simplified method of evaluating the stress wave environment of internal equipment N80-16205
A statistical look at modal displacement response to sequential excitations --- vibratory pointing error N80-16213
On determining the number of dominant modes in sinusoidal structural response N80-16214
Shock spectra design methods for equipment-structure systems N80-16227
Identification, detection and validation of vibrating structures: A signal processing approach [UCID-18270] N80-16383

SUBMARINE PROPULSION
An evaluation of direct current electromagnetic propulsion in seawater [AD-A074830] N80-16280

SUBROUTINES
Digital adaptive controllers for VTOL vehicles. Volume 2: Software documentation [NASA-CR-159154-VOL-2] N80-16066
FORTRAN subroutines for bicubic spline interpolation [ORNL/CSD/TM-67] N80-16777
PIE: A FORTRAN subroutine for plotting circles, concentric circles, pie charts, and shaded pie charts [ORNL/CSD/TM-82] N80-16781

SUBSONIC FLOW
Average gust frequencies subsonic transport aircraft [ESDU-69023-A-B-C] N80-16029
Development of panel methods for subsonic analysis and design [NASA-CR-3234] N80-16033

SUBSONIC WIND TUNNELS
Turbulence measurements in the boundary layer of a low-speed wind tunnel using laser velocimetry [NASA-TM-81165] N80-16300

SUBSTRUCTURES
Determination of the in situ permeability of base and subbase courses [PB-300908/1] N80-16245
Analytical method for determining seismic response of cooling towers on footing foundations [PB-301398/3] N80-16250

SULFATES
Air quality data for nonmetallic inorganic ions: NH4+, NO3-, SO4= from the National Air Sureveillance Networks, 1976
[PB-300458/7] N80-16599
Detailed characterization of gaseous and size resolved particulate pollutants at a south coast air basin smog receptor site: levels and modes of formation of sulfate, nitrate and organic particulates and their implications for control strategies
[PB-301294/5] N80-16611

SULFONATES
Transport properties of chlorosulfonated block copolymers --- to study the sorption and diffusion of water at various humidities N80-16160

SULFUR
Potential production and marketing of FGD byproduct sulfur and sulfuric acid in the US (1983 projection)
[PB-299205/5] N80-16617

SULFUR DIOXIDES
Remote sensing of sulfur dioxide effects on vegetation - photometric analysis of aerial photographs
[PB-300460/3] N80-16600
Development of an SO2 monitor for mobile sources
[PB80-100472] N80-16606

SULFURIC ACID
Potential production and marketing of FGD byproduct sulfur and sulfuric acid in the US (1983 projection)
[PB-299205/5] N80-16617

SUMMARIES
An experiment in synopsis publishing in the field of mechanical engineering
[BLL-BLRDR-5498] N80-16945

SUMMER
Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods
[APL/JHU/SIR-79U-016] N80-16262
Mesoscale characteristics of the Texas hiplex area during summer 1977
[PB-298963/0] N80-16697

SUNLIGHT
Modeling the beam characterization system
[SAND-79-1295C] N80-16530

SUNSPOTS
Very Large Array (VLA) observations of solar active regions
[AD-A066780] N80-17009

SUPERCONDUCTING MAGNETS
Vapor locking and heat transfer under transient and steady state conditions --- to study thermal stability of super conducting magnets
[CONF-790815-19] N80-16303

SUPERCONDUCTIVITY
Superconducting notch filter --- for application to the HF communication band
[CONF-790815-23] N80-16281
Alteration of the superconducting properties of A15 compounds and elementary composite superconductors by non-hydrostatic elastic strain
[BNL-26400] N80-16282

SUPERCONDUCTORS
Ginzburg-Landau theory and the superconducting transition in thin, amorphous bismuth films
N80-16912

SUPERFLUIDITY
Second sound shock waves and critical velocities in liquid helium 2
[NASA-CR-162687] N80-16837

SUPERHEATING
The effect of superheating on the performance of floating droplet direct contact heat exchangers
N80-16293

SUPERSATURATION
Formation of supersaturated alloys by ion implantation and pulsed-laser annealing N80-16137

SUPERSONIC COMBUSTION RAMJET ENGINES
Infrared measurements of a scramjet exhaust --- to determine combustion efficiency
[NASA-CR-3242] N80-16058

SUPPORTS
Mirror position display equipment for the target chamber mirror mounts of the LASL Helios laser fusion facility
[LA-UR-79-569] N80-16894

SURFACE DEFECTS
Heavy-section steel technology program --- for liquid cooled reactor materials
[NUREG-CR-0818] N80-16235

SURFACE FINISHING
Performance of Alternate Coatings in the Environment (PACE)
[PB-300869/7] N80-16174
Tribological properties of silicon carbide in metal removal process
[NASA-TM-79238] N80-16340

SURFACE NAVIGATION
Long-range electronic navigation systems in the Hawaiian Archipelago
[PB-300842/2] N80-16052

SURFACE PROPERTIES
An investigation of crystal surface structure by reflection electron diffraction N80-16910
Surface self-diffusion of germanium and silicon
[UCRL-82865] N80-16921

SURFACE REACTIONS
Low energy electron vibrational excitation of molecules adsorbed on surfaces: Experiment and theory N80-16842
Interactions of molecular and ion beams with surfaces --- bibliographies
[AD-A073278] N80-16853
Interactions of molecules with surfaces
[COO-4974-1] N80-16861

SURFACE TEMPERATURE
Investigation of the application of HCMM thermal data to snow hydrology --- Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397
Input data for solar systems
[DOE/TIC-10193-REV-1] N80-16504

SURFACE WAVES
Analytical and design techniques for drag reduction studies on wavy surfaces --- Navier-Stokes equation
[NASA-CR-3225] N80-16297

SURGES
The unique cosmic event of 1979 March 5
[NASA-TM-80630] N80-17012

SURVEILLANCE RADAR
A survey of airborne radar systems for deployment on a High Altitude Powered Platform (HAPP)
[NASA-CR-156860] N80-16264

SUSQUEHANNA RIVER BASIN (MD-NY-PA)
Flow routing in the Susquehanna River basin. Part 2: Low-flow frequency characteristics of the Susquehanna River between Waverly, New York and Sunbury, Pennsylvania
[PB-301392/7] N80-16414
Flow routing in the Susquehanna River Basin. Part 3: Routing reservoir releases in the Tioga and Chemung Rivers System, Pennsylvania and New York
[PB-301393/5] N80-16415

SWEPTBACK WINGS
Nonparallel stability of three-dimensional compressible boundary layers. Part 1: Stability analysis
[NASA-CR-3245] N80-16296

SYMBOLIC PROGRAMMING
Factors affecting computer program comprehension N80-16762

SYMBOLS
Computer science and technology: A key notarization system for computer networks
[PB80-104698] N80-16787
Formal description, coding and computer handling of generic formulae in chemical patents --- parsing algorithms
[BLL-BLRDR-5490] N80-16944

SYMMETRY
Soliton masses in supersymmetric theories
[COO-1764-363] N80-16928

SYNCHRONOUS MOTORS
WTG Energy Systems' MP1-200 200 kilowatt wind turbine generator --- a fixed pitch rotor configuration driving a synchronous generator N80-16458

SYNOPTIC METEOROLOGY
A comparison of GLAS SAT and NMC high resolution NOSAT forecasts from 19 and 11 February 1976
[NASA-TM-80591] N80-16678
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, volume 3. Area 17, Tahiti Island and Moorea Island; area 18, Tuamotu Archipelago; area 19, Pitcairn Island; area 20, Easter Island; area 21, Isla San Ambrosio and Isla San Felix; area 22, Islas Juan Fernandez; area 23, Norfolk Island; area 24, Chatham Island
[AD-A073874] N80-16685
Summary of Synoptic Meteorological Observations (SSMO): Selected South Pacific Island marine areas, New Zealand, volume 4. Area 25, Auckland west; area 26, Auckland east; area 27, Cook Strait nw; area 28, Cook Strait; area 29, Hawke Bay; area 30, South Island nw; area 31, Foveaux Strait; area 32, Christchurch
[AD-A073875] N80-16686

SYNTHETIC APERTURE RADAR
Weighting in digital synthetic aperture radar processing
[NASA-CR-162684] N80-16263
L-band radar sensing of soil moisture --- Kern County, California
[NASA-TM-80628] N80-16404
Synthetic aperture radar/LANDSAT MSS image registration
[NASA-RP-1039] N80-16405

SYNTHETIC FUELS
Development studies on selected conversion of synthesis gas from coal to high octane gasoline
[FE-2276-27] N80-16190
Gasohol: A technical memorandum
[PB80-105885] N80-16194
Alcohol fuels. Citations from the American petroleum institute data base --- a bibliography with abstracts
[NTIS/PS-79/0911/2] N80-16195

SYSTEM FAILURES
Reliability rate of computer systems described
N80-16755

SYSTEMS ANALYSIS
Comparability for UHF television: A preliminary analysis
[PB-301267/1] N80-16270
Independent assessment of energy policy models
[EPRI-EA-1071] N80-16510
Performance characteristics of a commercially available point-focus solar power --- systems analysis of a solar energy conversion system in terms of power efficiency and energy conversion efficiency
[SERI/TP-34-169] N80-16529
Direct energy conversion systems
[COO-2218-117] N80-16543
Performance evaluation of a low-first-cost, three-ton, air-to-air heat pump in the heating mode --- performance tests to analyze heat pumps and their corresponding systems
[ORNL/CON-18] N80-16551
Performance evaluation of the New Mexico State University solar house
[PB-301225/9] N80-16553
Comparative assessment of residential energy supply systems that use fuel cells: Executive summary --- domestic energy supply systems analysis of coal fired power plants using fuel cells
[PB-299207/1] N80-16564
NCR Corporation, IMOS COBOL: Indexed I-O based X3.23-1974
[PB80-101668] N80-16752
Comparison of nonlinear least squares software
[SAND-79-0483] N80-16784
Output ensemble average of periodically excited linear time-varying systems --- applicable to a missile intercept problem
[TAE-372] N80-16798
Confirmatory analysis and detail design of the magnet system for Mirror Fusion Test Facility (MFTF)
[UCRL-13923] N80-16893

SYSTEMS ENGINEERING
Liquid spring shock isolator modeling by system identification N80-16222
Shock spectra design methods for equipment-structure systems N80-16227
Digital recording using hologram arrays: Some initial experiments in 100 M bit/s recording
[BBC-RD-1979/23] N80-16312
Thermoluminescence dating apparatus efficiency measurement using a standard light source
[BNL-24525] N80-16314
Antares laser power amplifier --- using a carbon dioxide laser
[LA-UR-79-1525] N80-16328

Inert gas welding. Citations from the NTIS data base --- a bibliography with abstracts
[NTIS/PS-79/0995/5] N80-16353
Inert gas welding, volume 3: Citations from the Engineering Index data base --- a bibliography with abstracts
[NTIS/PS-79/0996/3] N80-16354
System configuration improvement N80-16481
Prototype solar heating and combined heating cooling systems
[NASA-CR-161340] N80-16485
Application analysis and photovoltaic system conceptural design for service/commercial/institutional and industrial sectors, task 1 report
[SAND-78-7032] N80-16550
Computational methods of system identification and parameter estimation N80-16761
Systems-design and energy-balance considerations for impact fusion
[LA-UR-79-1969] N80-16899

SYSTEMS MANAGEMENT
Satellite Power System (SPS)
[NASA-TM-80943] N80-16484
Technology assessment: ADP installation performance measurement and reporting
[PB80-101322] N80-16751

SYSTEMS STABILITY
Stability analysis and response characteristics of two-degree of freedom nonlinear systems
N80-16225

T

TABLES (DATA)
AVE-SESAME 1: 25-MB sounding data
[NASA-TM-78256] N80-16683

TAIL ASSEMBLIES
Composite components under impact load and effects of defects on the loading capacity --- Alpha Jet tail assembly
[NASA-TM-75351] N80-16104

TARGET RECOGNITION
Backscatter response of snow covered roads and roadside surfaces
[SAND-79-7046] N80-16413

TARS
Heavy hydrocarbons from coal gasification vapor pressures and dew point N80-16111

TDR SATELLITES
Satellite time transfer via Tracking and Data Relay Satellite System (TDRSS) and applications
[NASA-TM-80605] N80-16084

TEA LASERS
Carbon dioxide lasers, volume 3: A bibliography with abstracts
[NTIS/PS-79/1067/2] N80-16334

TECHNOLOGICAL FORECASTING
Energy conservation in industry: The present approach, the future opportunities
[PB-301244/0] N80-16556

TECHNOLOGY ASSESSMENT
Technological forecasting-aircraft design. Citations from the International Aerospace Abstracts data base
[NTIS/PS-79/1017/7] N80-16057
International investigation of the magnetosphere
N80-16076
Development of a standard methodology for the correlation and extrapolation of elevated temperature creep and rupture data. Volume 2: A state-of-the-art review
[EPRI-FP-1062-VOL-2] N80-16152
Hydrogen as a fuel N80-16177
NBS interagency transducer project: An coverview, 1951 - 1979 --- technology assessment of pressure sensors used in telemetry
[PB-300369/6] N80-16316
Results of a utility survey of the status of large wind turbine development N80-16479
Preparation of thin films for solar energy utilization
[SAND-79-1754C] N80-16517
Photovoltaic effect, its present understanding and remaining mysteries
[DOE/ET/23103-6] N80-16535
Potential utilization of the NASA/George C. Marshall Space Flight Center in earthquake engineering research
[NASA-CR-161371] N80-16650
Process computer technology development reviewed N80-16754
Comments on TEC trends
[NASA-TM-79317] N80-16885
Radiation-hardened bulk CMOS technology
[SAND-79-0714C] N80-16919
Linking science and technology to public policy: The role of universities
[PB80-108202] N80-16934

TECHNOLOGY TRANSFER
The presentation of science by the media
[BLL-BLRDR-5494] N80-16943
Personal current awareness service: A handbook of techniques for manual SDI
[BLRDR-5502] N80-16947
Overall city technology process
[PB-301109/5] N80-16969

TECHNOLOGY UTILIZATION
Rotor-bearing dynamics technology design guide. Part 3: Tapered roller bearings
[AD-A074827] N80-16344
Space benefits: The secondary application of aerospace technology in other sectors of the economy
[NASA-CR-162697] N80-16950
Microcomputer system K 1520 examined
N80-17020

TECTONICS
Application of plate tectonics to the location of new mineral targets in the Appalachians
[PB-300512/1] N80-16442
Geology of the Acarigua area, Venezuela
N80-16630
The Yallahs fan delta, southeastern Jamaica: A depositional model for active tectonic coastlines
N80-16632
Plate motions relative to the paleomagnetic axis and the lower mantle N80-16635

TELEMETRY
USSR Report: Space, no. 1
[JPRS-74805] N80-16075
A grouped binary time code for telemetry and space applications
[NASA-TM-80606] N80-16090
NBS interagency transducer project: An coverview, 1951 - 1979 --- technology assessment of pressure sensors used in telemetry
[PB-300369/6] N80-16316

TELEVISION SYSTEMS
Comparability for UHF television: A preliminary analysis
[PB-301267/1] N80-16270

TEMPERATURE DISTRIBUTION
Temperature sections along the C-line over the shelf of Cabo Nazca, Peru from moored current meters, 18 March-10 May 1977 and CTD observations, 5 March-15 May 1977
[PB-301101/2] N80-16713

TEMPERATURE EFFECTS
Effect of temperature on composite sandwich structures subjected to low velocity impact --- aircraft construction materials
[NASA-CR-162718] N80-16103
Influence of heat treatment on the microstructure and mechanical properties of Alloy 718 base metal and weldments
[HEDL-TME-78-54] N80-16156
Probabilistic analysis of temperature loads for structures, structural loads analysis and specifications project
[PB-301415/6] N80-16251
The influence of variations in ozone concentration on the temperature regime of the atmosphere
[NASA-TM-75350] N80-16649
Finite temperature effect of ray tracing near the electron cyclotron resonance
[IPPJ-427] N80-16881

TEMPERATURE GRADIENTS
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 1: Estimate of the electron velocity distribution functions
[NASA-CR-162696] N80-16851

TEMPERATURE INVERSIONS
Investigation of digital microwave communications in a strong meteorological ducting environment
[PB-301212/7] N80-16269
Numerical simulation of the formation and dissipation of stratus cloud under an inversion N80-16673

TEMPERATURE PROFILES
A case study of height and temperature analyses derived from Nimbus-6 satellite soundings on a fine mesh model grid N80-16642
Linear spectral model of tropical mesoscale systems N80-16672

TENSILE DEFORMATION
Deformation hardening of type 304 stainless steel at elevated temperature
[CONF-790801-4] N80-16147

TENSILE STRENGTH
Effect of heat treatment on the elevated temperature tensile and fracture toughness response of Alloy 718
[HEDL-TME-78-98] N80-16151
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932

TENSILE STRESS
Tensile cracks in creeping solids
[COO-3084-64] N80-16388

TENSILE TESTS
Fracture modes of high modulus graphite/epoxy angleplied laminates subjected to off-axis tensile loads
[NASA-TM-81405] N80-16102

TEREPHTHALATE
Development of dry process microporous polysulfone supports for ultrathin film composites
[PB-300488/4] N80-16133

TERMINAL BALLISTICS
Test evaluation of shock buffering concept for hydrodynamic ram induced by yawing projectile impacting a simulated integral fuel tank N80-16209

TERMINAL VELOCITY
Terminal velocity and rotation rate of a flyer plate propelled by a tube-confined explosive charge
N80-16229

TERNARY ALLOYS
Long-life fatigue test results for two nickel-base structural alloys
[KAPL-4105] N80-16150
Illustration of ternary diagram synthesis-Mn-Ti-Fe and Al-Ti-Fe
[BNL-26392] N80-16153

TERRACES (LANDFORMS)
Quaternary stream terraces in the northwestern Sacramento Valley, Glenn, Tehama, and Shasta Counties, California N80-16631

TERRAIN
Dipole broadside glide slope array --- for landing systems
[AD-A077042] N80-16047

TEST EQUIPMENT
Transponder Performance Analyzer (TPA)
[AD-A075783] N80-16048
Optical sieve comparator development project
[PB-300472/8] N80-16317
Design, fabrication and testing of the air-jet oil boom
[PB80-102635] N80-16593

TEST FACILITIES
Recent research on V/STOL test limits at the University of Washington aeronautical laboratory
[NASA-CR-3237] N80-16068
Design considerations for attaining 200-knot test velocities at the aircraft landing loads and traction facility
[NASA-TM-80096] N80-16071
Experimental test facility for selective radiative cooling surfaces
[LBL-9697] N80-16518
Solar central test facility
[SAND-79-1730C] N80-16524
Midtemperature solar systems test facility experiment manual and test plan
[SAND-79-0379] N80-16528
Potential utilization of the NASA/George C. Marshall Space Flight Center in earthquake engineering research
[NASA-CR-161371] N80-16650

TEST STANDS
Addition of an air-cooled collector test capability to the solar collector test facility
[PB-300482/7] N80-16562

TESTES
Effect of gravitation stress and hypokinesia on blood vessels of the testicle
[NASA-TM-75942] N80-16726

TEXAS
Occurrence availability and chemical quality of ground water in the Edwards Plateau region of Texas
[PB-299790/6] N80-16428

TEXTURES
Textural properties of surficial sediments of lower bay of New York harbor
[PB80-106479] N80-16592
A comparison of some simple methods for extracting texture primitives and their effectiveness in texture discrimination
[AD-A073956] N80-16771

THEOREM PROVING
Weak bases for topological spaces N80-16828

THEORETICAL PHYSICS
Research program in theoretical high-energy physics
[COO-3130TA] N80-16869

THERMAL CONDUCTIVITY
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932

THERMAL ENERGY
Meteorological Effects of Thermal Energy Releases (METER) program
[ORNL/TM-6867] N80-16693
Implanted energy conversion system
[PB80-101116] N80-16733

THERMAL ENVIRONMENTS
Space shuttle base heating analysis
[NASA-CR-161375] N80-16089

THERMAL EXPANSION
Thermal, mechanical, and physical properties of selected bituminous coals and cokes
[PB-300398/5] N80-16932

THERMAL RADIATION
A computational model describing the initiation of silver acetylide-silver nitrate explosive by an intense light source N80-16228

THERMAL RESISTANCE
Aluminum ion-containing polyimide adhesives --- bonding temperature resistant materials
[NASA-CASE-LAR-12640-1] N80-16164

THERMAL STABILITY
Thermal stability of isocyanate based polymers
N80-16162
Aluminum ion-containing polyimide adhesives --- bonding temperature resistant materials
[NASA-CASE-LAR-12640-1] N80-16164
Vapor locking and heat transfer under transient and steady state conditions --- to study thermal stability of super conducting magnets
[CONF-790815-19] N80-16303

THERMIONIC POWER GENERATION
Comments on TEC trends
[NASA-TM-79317] N80-16885

THERMIONICS
Comments on TEC trends
[NASA-TM-79317] N80-16885

THERMOCHEMISTRY
Testing the interlaminate adhesion of multilayer printed wiring boards
[BDX-613-2011] N80-16169

THERMODYNAMIC EFFICIENCY
Combustion optimization studies for stratified charge and diesel engines
[COO-4191-2] N80-16346

THERMODYNAMIC PROPERTIES
Composite materials research and education program: The NASA-Virginia Tech composites program
[NASA-CR-162719] N80-16101
Characteristics of very concentrated aqueous solutions
[LBL-9660] N80-16120
Characterization of halthane polyurethane adhesives. 1: Dynamic mechanical and thermal properties
[UCRL-82694] N80-16171
Tests of new theories for crystal anharmonicity
N80-16908
High-temperature thermodynamic properties of the thorium-oxygen system
[CONF-790761-1] N80-16927
THERPP: A Thermodynamic Properties Program
[TREE-1081-REV] N80-16929

THERMODYNAMICS
The reduction of silica and mullite in hydrogen --- kinetics, thermodynamics, and mass transport phenomena N80-16115
Thermodynamic considerations in the support of life for long space voyages
[NASA-CR-162755] N80-16738
Molecular thermodynamics of dew-point calculations in coal gasification processes N80-16926

THERMOELECTRIC POWER GENERATION
A 15kWe (nominal) solar thermal electric power conversion concept definition study: Steam Rankine reheat reciprocator system
[NASA-CR-159590] N80-16491
The 15 kW sub e (nominal) solar thermal electric power conversion concept definition study: Steam Rankine turbine system
[NASA-CR-159589] N80-16493
Heliostat system design and operation. Citations from the Engineering Index data base
[NTIS/PS-79/0930/2] N80-16571

THERMOLUMINESCENCE
Thermoluminescence dating apparatus efficiency measurement using a standard light source
[BNL-24525] N80-16314

THERMONUCLEAR REACTIONS
Plasma physics and problems of controlled thermonuclear reactions
[UCRL-TRANS-11487] N80-16888

THICK WALLS
Development of automated welding processes for field fabrication of thick-walled pressure vessel: Electron beam method
[DOE/ET-2606/3] N80-16348

THICKNESS
Strong thin membrane structure --- solar sails
[NASA-CASE-NPO-14021-2] N80-16163

THIN FILMS
Development of dry process microporous polysulfone supports for ultrathin film composites
[PB-300488/4] N80-16133
Strong thin membrane structure --- solar sails
[NASA-CASE-NPO-14021-2] N80-16163
Statistical analysis of absorptive laser damage in dielectric thin films
[UCRL-81670] N80-16325
Amorphous silicon thin film heterojunction solar cells
[SAN-1846-T3] N80-16496
Preparation of thin films for solar energy utilization
[SAND-79-1754C] N80-16517
Emerging material systems for solar cell applications
[DOE/E[illegible]-23003/1] N80-16533
Photovoltaic Materials and Device Measurements Workshop: Focus on polycrystalline thin film cells
[SERI/TP-49-185] N80-16538

THIN PLATES
Finite-element analysis of laminated biomodulus composite-material plates
[AD-A074184] N80-16376
Stress wave attenuation in thin structures by ultrasonic through-transmission
[NASA-CR-3203] N80-16836

THORIUM OXIDES
High-temperature thermodynamic properties of the thorium-oxygen system
[CONF-790761-1] N80-16927

THREE DIMENSIONAL FLOW
Application of numerical optimization to the design of wings with specified pressure distributions
[NASA-CR-3238] N80-16031
Nonparallel stability of three-dimensional compressible boundary layers. Part 1: Stability analysis
[NASA-CR-3245] N80-16296
Instrumentation for the measurement of turbulence components in a three-dimensional flow field
[AD-A073954] N80-16301
Numerical solution of three-dimensional natural convection by the strongly implicit procedure
[DP-MS-78-14] N80-16310

THUNDERSTORMS
Thunderstorm-environment interactions determined with three-dimensional trajectories
[NASA-RP-1054] N80-16675
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16677

THYROID GLAND
Catecholamines and myocardial contractile function during hypodynamia and with an altered thyroid hormone balance
[NASA-TM-78000] N80-16720
Influence of x irradiation and diet on pituitary/thyroid function in the rat
[UR-3490-1674] N80-16722

TIDES
The enhanced nodal equilibrium ocean tide and polar motion
[NASA-TM-80592] N80-16700
An assessment of the effects of bathymetric changes associated with sand and gravel mining on tidal circulation in the lower bay of New York Harbor
[PB80-106487] N80-16703

TIMBER IDENTIFICATION
Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types --- San Juan Mountains, Colorado
[E80-10041] N80-16391

TIMBER INVENTORY
Computer-aided processing of LANDSAT MSS data for classification of forestlands --- San Juan Mountains, Colorado
[E80-10043] N80-16393

TIME FUNCTIONS
Time integrating optical signal processing
N80-16875

TIME LAG
Modeling pilot response delays to beacon collision avoidance system commands
[AD-A075946] N80-16734

TIME MEASUREMENT
Thermoluminescence dating apparatus efficiency measurement using a standard light source
[BNL-24525] N80-16314

TIME SERIES ANALYSIS
Spectral estimation for a randomly sampled time-series N80-16814
Statistical analysis of the interrupted time-series experiment: Some problems and a recommended solution
[CONF-791043-1] N80-16822

TIME SIGNALS
Satellite time transfer via Tracking and Data Relay Satellite System (TDRSS) and applications
[NASA-TM-80605] N80-16084

TIN
Structural properties of NB3SN diffusion layers fabricated on single crystal Nb substrates
[AD-A074738] N80-16915

TISSUES (BIOLOGY)
A stochastic approach to ultrasonic tissue characterization N80-16834

TITANIUM ALLOYS
Titanium combustion in turbine engines
[AD-A075657] N80-16059
Illustration of ternary diagram synthesis-Mn-Ti-Fe and Al-Ti-Fe
[BNL-26392] N80-16153
Fundamentals of plasma arc welding
[AD-A074340] N80-16343

TITANIUM BORIDES
Preparation of fiber reinforced titanium diboride and boron carbide composite bodies
[LA-UR-79-969] N80-16109
Energy savings through use of an improved reduction cell cathode
[SAN-1257-T2] N80-16515

TOKAMAK DEVICES
A twin optically-pumped far-infrared CH3OH laser for plasma diagnostics --- Tokamak devices
[IPPJ-428] N80-16882
High beta Tokamaks
[CONF-780811-23] N80-16891
Hydrogen pellet fueling experiment on the ISX-A Tokamak
[ORNL/TM-6496] N80-16892
Aspects of Tokamak toroidal magnet protection
[COO-2431-6] N80-16900

TOLLMEIN-SCHLICHTING WAVES
Effect of streamwise vortices on Tollmien-Schlichting waves
[NASA-CR-162654] N80-16294

best copy available

TOPOGRAPHY
Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types — San Juan Mountains, Colorado
[E80-10041] N80-16391
On the propagation of free topographic Rossby waves near continental margins
[PB-299949/8] N80-16704

TOPOLOGY
Qualitative study of nonlinear problems in analysis
[AD-A074017] N80-16807
Weak bases for topological spaces N80-16828
Applications of centre manifold theory
[AD-A074052] N80-16829

TOROIDAL PLASMAS
Stability of a toroidal plasma by hot electron annulus in a bumpy torus
[IPPJ-426] N80-16860
NCMART: Algorithms and computer codes for a modified algebraic spatial reconstruction of spectroscopic emissivities for ELMO bumpy torus
[ORNL/TM-6500] N80-16896

TORSION
Design equation for tripping of stiffeners under in plane and lateral loads
[AD-A074752] N80-16379

TORSIONAL STRESS
Shaft torsional oscillations of hydrogenerators
[PB80-102155] N80-16286

TOWERS
Analytical method for determining seismic response of cooling towers on footing foundations
[PB-301398/3] N80-16250
Cooling tower water conditioning study — using ozone
[NASA-CR-162691] N80-16576

TRAJECTORIES
Thunderstorm-environment interactions determined with three-dimensional trajectories
[NASA-RP-1054] N80-16675

TRANSFER FUNCTIONS
A simplified method of evaluating the stress wave environment of internal equipment N80-16205
Stochastic filtering and control
[AD-A074258] N80-16820

TRANSFER ORBITS
Upper stages utilizing electric propulsion
[NASA-TM-81412] N80-16097

TRANSHORIZON RADIO PROPAGATION
Rapid-scanning measurements of wind-produced doppler on an asymmetrical microwave transhorizon propagation path N80-16674

TRANSITION METALS
Magnetic properties of selected transition metal compounds N80-16136
Interactions of molecular and ion beams with surfaces — bibliographies
[AD-A073278] N80-16853

TRANSITION POINTS
Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 1: Estimate of the electron velocity distribution functions
[NASA-CR-162696] N80-16851
Molecular thermodynamics of dew-point calculations in coal gasification processes N80-16926

TRANSITION TEMPERATURE
Dynamics near the phase transitions in liquid crystals N80-16909

TRANSLATIONAL MOTION
Lateral and tilt whirl modes of flexibly mounted flywheel systems N80-16215

TRANSMITTERS
Apparatus for endoscopic examination — analysis of the propulsion system configuration and transmitter
[NASA-CASE-NPO-14092-1] N80-16725

TRANSONIC FLOW
Application of numerical optimization to the design of wings with specified pressure distributions
[NASA-CR-3238] N80-16031

TRANSPONDERS
Transponder Performance Analyzer (TPA)
[AD-A075783] N80-16048
Satellite time transfer via Tracking and Data Relay Satellite System (TDRSS) and applications
[NASA-TM-80605] N80-16084

TRANSPORT AIRCRAFT
Average gust frequencies subsonic transport aircraft
[ESDU-69023-A-B-C] N80-16029

TRANSPORT PROPERTIES
Transport properties of chlorosulfonated block copolymers — to study the sorption and diffusion of water at various humidities N80-16160
Coastal upwelling ecosystems analysis: Respiration and respiratory electron transport activity in plankton from the northwest African upwelling area
[PB-301029/5] N80-16706
High beta Tokamaks
[CONF-780811-23] N80-16891
Theoretical studies of bound exciton decay and of transport across semiconductor interfaces N80-16904
Analysis of erosion and transportation features from lunar orbiter and Apollo photography
[NASA-CR-162703] N80-17005

TRANSPORTATION
Human service agency transportation coordination
[PB-300891/9] N80-16965
Transportation needs for the elderly, handicapped and low income of Mississippi
[PB-301273/9] N80-16971

TRANSPORTATION ENERGY
Worldwide transportation/energy demand forecast, 1975 - 2000
[ORNL/SUB-78/13536/1] N80-16546
Contributions to the foundations of supply for energy and transportation: Concepts, economics, and technologies
[PB-300541/0] N80-16554
Coping with energy limitations in transportation: Proposals for Michigan
[PB-299737/7] N80-16559

TRANSPORTATION NETWORKS
Characteristics of urban transportation systems: A handbook for transportation planners
[PB-301319/0] N80-16964
Stronger Federal direction needed to promote better use of present urban transportation systems
[PB-300974/3] N80-16966

TRAPPED MAGNETIC FIELDS
Review of electron-beam heating of magnetic mirror confined plasmas, with application to the Tandem Mirror Experiment
[UCRL-52759] N80-16890

TRAPPED PARTICLES
Two-dimensional eigenmode analysis of the trapped-ion instability N80-16878

TRAPPING
Whistler wave trapping in a density crest
[IPPJ-429] N80-16883

TRAPS
Hydrodynamic equilibrium of plasma in an ambipolar trap
[UCRL-TRANS-11493] N80-16887

TREES (MATHEMATICS)
Consistent nonparametric estimation of best linear classification rules/solving inconsistent systems of linear inequalities N80-16797
Using SETS to find minimal cut sets in large fault trees
[SAND-78-1943C] N80-16809

TRIANGULATION
Technique to determine location of radio sources from measurements taken on spinning spacecraft
[NASA-TM-80598] N80-16260

TRINITROTOLUENE
Evaluation of the ultraviolet-ozone and ultraviolet-oxidant treatment of pink water
[PB-300763/0] N80-16603

TROPICAL METEOROLOGY
Linear spectral model of tropical mesoscale systems N80-16672
Mariners weather log, volume 23, number 4,
[PB-300277/1] N80-16681

TROPICAL STORMS
Mariners weather log, volume 23, number 4,
[PB-300277/1] N80-16681

TRUCKS
A study of aerodynamic methods for improving truck fuel economy
[PB80-101272] N80-16040
Truck design optimization project. Phase 2: Analytical tool assessment report
[PB80-104888] N80-16960

TUBE HEAT EXCHANGERS
OTEC performance tests of the Union Carbide enhanced-tube condenser
[ANL/OTEC-PS-2] N80-16523

TUNNELING (EXCAVATION)
Mechanical tunnel boring prediction and machine design
[PB80-101660] N80-16239

TURBINE BLADES
Design of turbine blades for effective slip damping at high rotational speeds N80-16219
Alcoa wind turbines N80-16464
Overview of Vertical Axis Wind Turbine (VAWT) N80-16466
Fabrication of extruded vertical axis turbine blades N80-16467
Operational experience with VAWT blades — structural performance N80-16468
Structural analysis considerations for wind turbine blades N80-16469
Blade design and operating experience on the MOD-OA 200 kW wind turbine at Clayton, New Mexico N80-16470
Evaluation of an operating MOD-OA 200 kW wind turbine blade N80-16471
Design, fabrication, and test of a steel spar wind turbine blade N80-16472
WTG Energy Systems' rotor: Steel at 80 feet N80-16473
The use of wood for wind turbine blade construction N80-16474
Large, low cost composite wind turbine blades N80-16475
The MOD-1 steel blade N80-16476
The Boeing MOD-2 wind turbine system rotor N80-16477

TURBINE ENGINES
Titanium combustion in turbine engines
[AD-A075657] N80-16059

TURBINES
Design evolution of large wind turbine generators N80-16455
The General Electric MOD-1 wind turbine generator program N80-16456
The Boeing MOD-2 wind tunnel system rated at 2.5 MW N80-16457
Characteristics of future Vertical Axis Wind Turbines (VAWTs) — to generate utility grid electric power N80-16462
Preliminary analysis of performance and loads data from the 2-megawatt mod-1 wind turbine generator
[NASA-TM-81408] N80-16494
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 1: Executive summary
[SAND-78-0962-VOL-1] N80-16539
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 2: Economic optimization model
[SAND-78-0962-VOL-2] N80-16540
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 3: Point designs
[SAND-78-0962-VOL-3] N80-16541
Economic analysis of Darrieus axis wind turbine systems for the generation of utility grid electrical power. Volume 4: Summary and analysis of the A. T. Kearney and Alcoa Laboratories point design economic studies
[SAND-78-0962-VOL-4] N80-16542

TURBOFAN ENGINES
Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159598] N80-16061
Core noise investigation of the CF6-50 turbofan engine
[NASA-CR-159749] N80-16062

TURBOMACHINE BLADES
Research on the flutter of axial turbomachine blading
[AD-A074597] N80-16064

TURBULENCE
Predicting transition to turbulence in the compressible boundary layer flow over a spinning cone N80-16025

TURBULENT BOUNDARY LAYER
Analytical and design techniques for drag reduction studies on wavy surfaces — Navier-Stokes equation
[NASA-CR-3225] N80-16297

Turbulence measurements in the boundary layer of a low-speed wind tunnel using laser velocimetry
[NASA-TM-81165] N80-16300

TURBULENT DIFFUSION
Theoretical modeling of coal and gas fired turbulent combustion and gasification processes N80-16176

TURBULENT FLOW
Transitional flow in an annulus N80-16289
Effect of streamwise vortices on Tollmien-Schlichting waves
[NASA-CR-162654] N80-16294
Instrumentation for the measurement of turbulence components in a three-dimensional flow field
[AD-A073954] N80-16301
Turbulent dusty gas motions with weak statistical coupling
[UCRL-82131] N80-16307
Prediction of laminar and turbulent flow heat transfer in annuli: passages
[PB-299867/2] N80-16311
A steady thermohaline convection model (driven by turbulent buoyant plumes from multiple isolated sources in a large nonturbulent finite region, with applications to the oceanic thermohaline circulation) N80-16698

TURBULENT WAKES
The motion of a vortex pair in a stratified medium N80-16026
A general method to determine the stability of compressible flows N80-16028

TWISTING
Means for controlling aerodynamically induced twist --- equipment to control twisting of slender wings due to aerodynamic loads
[NASA-CASE-LAR-12175-1] N80-16055

TWO BODY PROBLEM
Electromagnetic scattering by two bodies of revolution N80-16277

TWO DIMENSIONAL BODIES
Computer simulation of the martensite transformation in a model two-dimensional body
[LBL-9346] N80-16157

TWO DIMENSIONAL BOUNDARY LAYER
Analytical and design techniques for drag reduction studies on wavy surfaces --- Navier-Stokes equation
[NASA-CR-3225] N80-16297

TWO DIMENSIONAL FLOW
Catalog of two-dimensional vortex patterns --- free energy minima
[LA-7384-MS] N80-16309

U

U.S.S.R.
USSR Report: Space, no. 1
[JPRS-74805] N80-16075

ULTRAHIGH FREQUENCIES
Comparability for UHF television: A preliminary analysis
[PB-301267/1] N80-16270
L-band radar sensing of soil moisture --- Kern County, California
[NASA-TM-80628] N80-16404

ULTRASONIC TESTS
Method of assessing the impact of metallurgical noise and its reduction in ultrasonic testing of austenitic welds
[GEFR-SP-164] N80-16349
Stress wave attenuation in thin structures by ultrasonic through-transmission
[NASA-CR-3203] N80-16838

ULTRASONIC WAVE TRANSDUCERS
Digital ultrasonic signal processing: Primary ultrasonics task and transducer characterization use and detailed description
[NASA-CR-161370] N80-16356

ULTRASONICS
A stochastic approach to ultrasonic tissue characterization N80-16834

ULTRAVIOLET ABSORPTION
Studies of atoms and molecules using multiphoton absorption of ultraviolet laser radiation N80-16844

ULTRAVIOLET LASERS
Studies of atoms and molecules using multiphoton absorption of ultraviolet laser radiation N80-16844

ULTRAVIOLET PHOTOMETRY
EUV observations of the local ism N80-16982

ULTRAVIOLET SPECTROPHOTOMETERS
Development of an SO2 monitor for mobile sources
[PB80-100472] N80-16806

UNDERGROUND STORAGE
Computer simulation of ground coupled storage in a series solar assisted heat pump system
[BNL-26216] N80-16507

UNDERWATER ACOUSTICS
Generalized Adams methods --- for underwater acoustic wave propagation problem
[AD-A074548] N80-16801
An examination of coupled mode theory as applied to underwater sound propagation N80-16832

UNDERWATER PROPULSION
An evaluation of direct current electromagnetic propulsion in seawater
[AD-A074830] N80-16280

UNITED KINGDOM
Investigation of requirements and implementation of facilities for connecting UK hosts to Euronet
[BLL-BLRDR-5508] N80-16788

UNITED STATES OF AMERICA
NCSL remote sensing project --- State Legislature considerations and activities
[E80-10053] N80-16401
Phytoplankton water quality relationships in US lakes. Part 1: Methods, rationale and data limitations
[PB-298439/1] N80-16419
Phytoplankton water quality relationships in US lakes. Part 2: Genera Acanthosphaera through Cystodinium Collected from eastern and southeastern lakes
[PB-298440/9] N80-16420
Phytoplankton water quality relationships in US lakes. Part 3: Genera Dactylococcopsis through Gyrosigma collected from eastern and southeastern lakes
[PB-298441/7] N80-16421
Phytoplankton water quality relationships in US lakes. Part 4: Genera Hantzchia through Pteromonas collected from eastern and southeastern lakes
[PB-298442/5] N80-16422
Phytoplankton water quality relationships in US lakes. Part 5: Genera Quadrigula through Zygnema collected from eastern and southeastern lakes
[PB-298443/3] N80-16423
Helium resources of the United States, 1977
[PB80-101744] N80-16426
Air quality data for nonmetallic inorganic ions: NH4+, NO3-, SO4= from the National Air Surveillance Networks, 1976
[PB-300458/7] N80-16599
Weekend/weekday differences in oxidants and their precursors
[PB-300479/3] N80-16612
Earthquake history of the United States, 1971 - 1976 supplement
[PB80-108434] N80-16661
Month and year ahead forecasting of monthly precipitation for the southeastern United States N80-16670
A comparison of GLAS SAT and NMC high resolution NOSAT forecasts from 19 and 11 February 1976
[NASA-TM-80591] N80-16678

UNIVERSITIES
Linking science and technology to public policy: The role of universities
[PB80-108202] N80-16934

UNIVERSITY PROGRAM
Composite materials research and education program: The NASA-Virginia Tech composites program
[NASA-CR-162719] N80-16101

UNSTEADY FLOW
Application of transient-flow to the Sacramento River at Sacramento, California
[PB-301103/8] N80-16448

UPWELLING WATER
Coastal upwelling ecosystems analysis. Interactions of primary nutrient and carbon uptake in the Peru current: A review and synthesis of laboratory and field results
[PB-301031/1] N80-16708

URANIUM
Evaluation of methods for cleaning low carbon uranium metal and alloy samples
[RFP-2793] N80-16155
Environmental system study on the development of fossil fuel resources in the Southwest
[PB-300526/1] N80-16596

URBAN DEVELOPMENT
Effects of urbanization on the magnitude and frequency of floods in northeastern Illinois
[PB-299065/3] N80-16438
Department of Housing and Urban Development, and certain independent agencies appropriations for fiscal year 1980, part 1
[GPO-41-318] N80-16949
The interaction between urbanization and land quality and quantity in environmental planning and design: The public institutions model technical documentation
[PB-301112/9] N80-16952
The interaction between urbanization and land quality and quantity in environmental planning and design: The housing model technical documentation
[PB-301111/1] N80-16953
The interaction between urbanization and land quality and quantity in environmental planning and design: The land value model technical documentation
[PB-301047/7] N80-16968

URBAN PLANNING
The interaction between urbanization and land quality and quantity in environmental planning and design: The public institutions model technical documentation
[PB-301112/9] N80-16952
The interaction between urbanization and land quality and quantity in environmental planning and design: The housing model technical documentation
[PB-301111/1] N80-16953
Characteristics of urban transportation systems: A handbook for transportation planners
[PB-301319/0] N80-16964
Stronger Federal direction needed to promote better use of present urban transportation systems
[PB-300974/3] N80-16966
The interaction between urbanization and land quality in environmental planning and design: The transportation model technical documentation
[PB-300981/8] N80-16967
The interaction between urbanization and land quality and quantity in environmental planning and design: The land value model technical documentation
[PB-301047/7] N80-16968
Overall city technology process
[PB-301109/5] N80-16969
Transit corridor analysis: A manual sketch planning technique
[PB-301378/6] N80-16975

URBAN TRANSPORTATION
Vehicle longitudinal control and reliability project. A review of AGT propulsion, power conditioning, braking and power distribution technology, volume 2, part C
[PB-300373/8] N80-16954
Vehicle longitudinal control and reliability project. A review of entrainment technology
[PB-300372/0] N80-16955
Characteristics of urban transportation systems: A handbook for transportation planners
[PB-301319/0] N80-16964
Stronger Federal direction needed to promote better use of present urban transportation systems
[PB-300974/3] N80-16966
The interaction between urbanization and land quality in environmental planning and design: The transportation model technical documentation
[PB-300981/8] N80-16967
Transit corridor analysis: A manual sketch planning technique
[PB-301378/6] N80-16975

UROLOGY
Prosthetic device for correction of urinary incontinence
[NASA-TM-78255] N80-16739

USER MANUALS (COMPUTER PROGRAMS)
Digital ultrasonic signal processing: Primary ultrasonics task and transducer characterization use and detailed description
[NASA-CR-161370] N80-16356
Evaluation of registration, compression, and classification algorithms. Volume 2: Documentation
[E80-10042] N80-16392
Wizard programmer manual
[AD-A074528] N80-16745

On-line programmer's management system. Addendum 1: User's guide to the JOVIAL debugger
[AD-A074495] N80-16775

USER REQUIREMENTS

Contingency factors affecting the user involvement role in the design of successful information systems
N80-16936

Transportation needs for the elderly, handicapped and low income of Mississippi
[PB-301273/9] N80-16971

UTAH

Groundwater quality monitoring of western oil shale development. Identification and priority ranking of potential pollution sources, — in eastern Utah
[PB-300536/0] N80-16623

UTILITIES

Results of a utility survey of the status of large wind turbine development N80-16479

Simulation studies of multiple large wind turbine generators on a utility network N80-16480

V

V/STOL AIRCRAFT

Investigation of ground effects on large and small scale models of a three fan V/STOL aircraft configuration
[NASA-CR-152240] N80-16030

Recent research on V/STOL test limits at the University of Washington aeronautical laboratory
[NASA-CR-3237] N80-16088

VAPOR DEPOSITION

Vapor locking and heat transfer under transient and steady state conditions — to study thermal stability of super conducting magnets
[CONF-790815-19] N80-16303

VAPOR PRESSURE

Heavy hydrocarbons from coal gasification vapor pressures and dew point N80-16111

VAPORS

Nitrogen dioxide vapor penetration of chlorobutyl rubber SCAPE under operational conditions
[NASA-TP-1605] N80-16118

VARIABLE STARS

A study of hydroxyl masers in the circumstellar envelopes of long period variable stars N80-16985

Mass loss from cataclysmic variable secondaries
N80-16994

VARIANCE (STATISTICS)

Variance approximations for estimators of fixed and random effects in mixed linear models N80-16796

VECTOR ANALYSIS

Vectorized sparse examination
[AD-A074091] N80-16808

VEGETATION

Digital processing of LANDSAT MSS and topographic data to improve capabilities for computerized mapping of forest cover types — San Juan Mountains, Colorado
[E80-10041] N80-16391

Collection and analysis of vegetative cover data — Hanford Site, Washington
[PNL-3068] N80-16412

Remote sensing of sulfur dioxide effects on vegetation - photometric analysis of aerial photographs
[PB-300460/3] N80-16600

Propagation of sound through the atmosphere. Effects of ground cover 2
[AD-A073262] N80-16840

VELOCITY DISTRIBUTION

Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 1: Estimate of the electron velocity distribution functions
[NASA-CR-162696] N80-16851

Non-Maxwellian velocity distribution functions associated with steep temperature gradients in the solar transition region. Paper 2: The effect of non-Maxwellian electron distribution functions on ionization equilibrium calculations for carbon, nitrogen and oxygen
[NASA-CR-162695] N80-16852

VENEZUELA

Geology of the Acarigua area, Venezuela
N80-16830

VENTILATION

Sideboard device for improved face ventilation in coal mines
[PB-300365/4] N80-16443

VENUS ATMOSPHERE

The structure and microphysical properties of the clouds of Venus
[NASA-TM-75725] N80-17006

VENUS CLOUDS

The structure and microphysical properties of the clouds of Venus
[NASA-TM-75725] N80-17006

VERTICAL DISTRIBUTION

Natural convection in a vertical channel with heat and mass transfer and flow reversal N80-16291

Design characteristics of the 224 kW Magdalen Islands VAWT N80-16483

Test results of the DOE/Sandia 17 meter VAWT
N80-16485

Fabrication of extruded vertical axis turbine blades
N80-16487

A pilot study of height and temperature analyses derived from Nimbus-6 satellite soundings on a fine mesh model grid N80-16642

Temperature sections along the C-line over the shelf of Cabo Nazca, Peru from moored current meters, 18 March-10 May 1977 and CTD observations, 5 March-15 May 1977
[PB-301101/2] N80-16713

VERTICAL MOTION

Feasibility and concept study to convert the NASA/AMES vertical motion simulator to a helicopter simulator
[NASA-CR-152193] N80-16070

VERTICAL TAKEOFF AIRCRAFT

The aerodynamics of a jet in a crossflow
[AD-A076375] N80-16034

Digital adaptive controllers for VTOL vehicles. Volume 1: Concept evaluation
[NASA-CR-159154-VOL-1] N80-16085

Digital adaptive controllers for VTOL vehicles. Volume 2: Software documentation
[NASA-CR-159154-VOL-2] N80-16086

VHF OMNIRANGE NAVIGATION

Results of a Loran-C flight test using an absolute data reference
[NASA-CR-162751] N80-16051

VIBRATION

The Shock and Vibration Bulletin. Part 1: Invited papers, vibrations and acoustics, blast and shock
[NASA-CR-162471] N80-16198

On the use of coherence functions to evaluate sources of dynamic excitation N80-16201

Whole-body vibration of heavy equipment operators N80-16216

Research related to the expansion and improvement of human vibration exposure criteria N80-16217

Some approximations in vibrations and wave motion of elastic media N80-16364

Steady state response of a circular foundation on a transversely isotropic medium N80-16369

VIBRATION DAMPING

The Shock and Vibration Bulletin. Part 2: Modal and impedance analysis, human response to vibration and shock, isolation and damping, dynamic analysis
[NASA-CR-162472] N80-16211

Design of turbine blades for effective slip damping at high rotational speeds N80-16219

A simple low-cost technique for measuring material damping behavior N80-16220

VIBRATION ISOLATORS

The Shock and Vibration Bulletin. Part 2: Modal and impedance analysis, human response to vibration and shock, isolation and damping, dynamic analysis
[NASA-CR-162472] N80-16211

Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218

VIBRATION MODE

On determining the number of dominant modes in sinusoidal structural response N80-16214

Application of random time domain analysis to dynamic flight measurements — B-1 aircraft
N80-16226

The free vibration equations, natural frequencies and modal characteristics of closed circular cylindrical shells
[NAL-TR-569T] N80-16373

VIBRATION TESTS

A simple low-cost technique for measuring material damping behavior N80-16220

The effects of frequency, amplitude, and load on the dynamic properties of elastomers N80-16221

A generalized derivative model for an elastomer damper N80-16223

VIBRATIONAL SPECTRA

The development and utilization of inelastic electron tunneling spectroscopy as a tool for investigating fundamental catalytic processes N80-16113

VIDEO EQUIPMENT

Heliostat beam characterization system-calibration technique — the design analysis and calibration techniques of heliostats using video equipment
[SAND-79-1532C] N80-16531

VIRGINIA

Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods
[APL/JHU/SIR-79U-016] N80-16282

Summary of aircraft results for 1978 southeastern Virginia urban plume measurement study of ozone, nitrogen oxides, and methane
[NASA-TM-80146] N80-16575

VISCOELASTIC DAMPING

A stability theorem for a dynamically loaded linear viscoelastic structure N80-16230

VISCOELASTICITY

The effects of frequency, amplitude, and load on the dynamic properties of elastomers N80-16221

VISCOSITY

Preliminary evaluation of commercial continuous instrumentation for the measurement of viscosity and coal concentration of Coal-Oil Mixtures (COM)
[HCP/T2483-03] N80-16315

VLASOV EQUATIONS

Stability of the field-reversed mirror — derived from vlasov equations
[COO-2218-138] N80-16869

VOICE DATA PROCESSING

Spectral peak amplitude coding for voice data compression — the coding of speech spectral bands for voice data processing N80-16258

VOLCANOLOGY

The stratigraphic sequence of volcanic and sedimentary units in the north polar region of Mars
[NASA-TM-78254] N80-17004

VOLT-AMPERE CHARACTERISTICS

Theoretical and experimental square wave voltammetry N80-16273

VORTICES

The motion of a vortex pair in a stratified medium
N80-16026

Summary of theoretical and experimental investigations of vortex lift at high angles of attack
[AD-A074483] N80-16037

Effect of streamwise vortices on Tollmien-Schlichting waves
[NASA-CR-162654] N80-16294

Catalog of two-dimensional vortex patterns — free energy minima
[LA-7384-MS] N80-16309

VOYAGER PROJECT

The occurence rate, polarization character and intensity of broadband Jovian kilometric radiation — Voyager Project
[NASA-TM-80627] N80-17002

Voyager 1: Encounter with Jupiter
[NASA-CR-162721] N80-17003

VOYAGER 1 SPACECRAFT

Voyager 1: Encounter with Jupiter
[NASA-CR-162721] N80-17003

VULNERABILITY

An evaluation of the ADINA finite element program for application to aircraft overpressure vulnerability
[AD-A074261] N80-16056

W

WALKING

Planar biped dynamics and control N80-16736

WALL FLOW

Turbulence measurements in the boundary layer of a low-speed wind tunnel using laser velocimetry
[NASA-TM-81195] N80-16300

WALLS

Experimental study of frame-wall interaction in reinforced concrete structures subjected to strong earthquake motions
[PB-301091/5] N80-16252

WASHINGTON

Collection and analysis of vegetative cover data — Hanford Site, Washington
[PNL-3068] N80-16412

Petrology and stratigraphy of paleogene nonmarine sandstones, Cascade Range, Washington
N80-16838

WASTE DISPOSAL

Sediment characteristics of the 2800 meter Atlantic nuclear waste disposal site: Radionuclide retention potential
[PB-301255/6] N80-16871

Low-level radioactive waste management. Volume 5: Policy recommendations, conclusions and summary
[PB80-105083] N80-16872

Low-level radioactive waste management. Volume 2: Forecast of low-level radwaste management requirements
[PB80-105059] N80-16873

Design and construction of covers for solid waste landfills
[PB80-100381] N80-16958

Wastewater renovation and retrieval on Cape Cod
[PB80-100423] N80-16961

WASTE TREATMENT

Optimal treatment levels of a stream pollution abatement system under three environmental control policies. Part 2: Preliminary sensitivity analysis of a convex equivalent of the fixed dissolved oxygen requirement policy GP model using SENSUMT
[AD-A074216] N80-16579

Analysis of airborne viable bacteria at solid waste processing facilities
[PB80-102338] N80-16590

Anaerobic biological treatment of liquid wastes from pyrolysis processes
[COO-4455-2] N80-16723

Low-level radioactive waste management. Volume 3: Feasibility of volume-reduction processes — for waste treatment
[PB80-105067] N80-16874

Municipal wastewater treatment by the overland flow method of land application
[PB80-102908] N80-16957

Biological treatment of high strength petrochemical wastewater
[PB80-100456] N80-16959

Wastewater renovation and retrieval on Cape Cod
[PB80-100423] N80-16961

Utilization of natural ecosystems for wastewater renovation
[PB80-100431] N80-16962

Activated carbon treatment of industrial wastewaters: Selected technical papers
[PB80-100522] N80-16963

Treatment of secondary effluent by infiltration-percolation — Boulder, Colorado
[PB80-103658] N80-16973

WASTE UTILIZATION

Preliminary assessment of the prospects for use of refuse-derived fuel in Maryland
[BNL-51065] N80-16179

WASTE WATER

Evaluation of a digital model for estuarine water quality simulation in waste allocation studies — Florida Gulf Coast
[PB-298820/2] N80-16437

Municipal wastewater treatment by the overland flow method of land application
[PB80-102908] N80-16957

Biological treatment of high strength petrochemical wastewater
[PB80-100456] N80-16959

Wastewater renovation and retrieval on Cape Cod
[PB80-100423] N80-16961

Utilization of natural ecosystems for wastewater renovation
[PB80-100431] N80-16962

Activated carbon treatment of industrial wastewaters: Selected technical papers
[PB80-100522] N80-16963

Treatment of secondary effluent by infiltration-percolation — Boulder, Colorado
[PB80-103658] N80-16973

WASTES

Meteorological Effects of Thermal Energy Releases (METER) program
[ORNL/TM-6867] N80-16693

WATER

Determination of water solubility in organic liquids
[RHO-SA-113] N80-16099

Transport properties of chlorosulfonated block copolymers — to study the sorption and diffusion of water at various humidities N80-16160

The dielectric properties of soil-water mixtures at microwave frequencies
[NASA-TM-80597] N80-16403

WATER CIRCULATION

Flow routing in the Susquehanna River basin. Part 2: Low-flow frequency characteristics of the Susquehanna River between Waverly, New York and Sunbury, Pennsylvania
[PB-301392/7] N80-16414

A mathematical hydrodynamic circulation model of Great Salt Lake for resource management
[PB-298013/3] N80-16436

The lower bay complex
[PB80-106990] N80-16594

A numerical investigation of the Bering Sea circulation using a linear homogeneous model
[PB-299864/7] N80-16711

WATER FLOW

Regional stochastic generation of streamflows using an ARMA (1,0,1) process and disaggregation
[PB-300945/3] N80-16431

Application of transient-flow to the Sacramento River at Sacramento, California
[PB-301103/8] N80-16448

WATER MANAGEMENT

Optimization techniques and numerical methods for aquifer management N80-16389

Flow routing in the Susquehanna River Basin. Part 3: Routing reservoir releases in the Tioga and Chemung Rivers System, Pennsylvania and New York
[PB-301393/5] N80-16415

Toward classification and rationale for watershed management and stream protection
[PB80-103153] N80-16417

WATER POLLUTION

Environmental development plan: Underground coal gasification
[DOE/EDP-0047] N80-16411

Determination of hydrologic parameters for glacial tills in Connecticut
[PB-300313/4] N80-16433

An analysis of the factors affecting the distribution of heavy metals in a tidal estuary N80-16573

Optimal treatment levels of a stream pollution abatement system under three environmental control policies. Part 2: Preliminary sensitivity analysis of a convex equivalent of the fixed dissolved oxygen requirement policy GP model using SENSUMT
[AD-A074216] N80-16579

Nitrate in effluents from irrigated lands — Santa Maria Valley
[PB-300582/4] N80-16587

Design, fabrication and testing of the air-jet oil boom
[PB80-102835] N80-16593

The lower bay complex
[PB80-106990] N80-16594

Groundwater quality monitoring of western oil shale development. Identification and priority ranking of potential pollution sources — in eastern Utah
[PB-300536/0] N80-16623

Municipal wastewater treatment by the overland flow method of land application
[PB80-102908] N80-16957

WATER QUALITY

Measurement of eddy diffusivity and solute transport through the near-sediment boundary layer of ice-covered lakes, using Radon-222 N80-16390

Water resources data of the Seward area, Alaska
[PB80-101298] N80-16418

Phytoplankton water quality relationships in US lakes. Part 1: Methods, rationale and data limitations
[PB-298439/1] N80-16419

Phytoplankton water quality relationships in US lakes. Part 2: Genera Acanthosphaera through Cystodinium Collected from eastern and southeastern lakes
[PB-298440/9] N80-16420

Phytoplankton water quality relationships in US lakes. Part 3: Genera Dactylococcopsis through Gyrosigma collected from eastern and southeastern lakes
[PB-298441/7] N80-16421

Phytoplankton water quality relationships in US lakes. Part 4: Genera Hantzchia through Pteromonas collected from eastern and southeastern lakes
[PB-298442/5] N80-16422

Phytoplankton water quality relationships in US lakes. Part 5: Genera Quadrigula through Zygnema collected from eastern and southeastern lakes
[PB-298443/3] N80-16423

Evaluation of a digital model for estuarine water quality simulation in waste allocation studies — Florida Gulf Coast
[PB-298820/2] N80-16437

Saltwater-barrier line in Florida: Concepts, considerations, and site examples
[PB80-101306] N80-16591

Groundwater quality monitoring of western oil shale development. Identification and priority ranking of potential pollution sources — in eastern Utah
[PB-300536/0] N80-16623

Wastewater renovation and retrieval on Cape Cod
[PB80-100423] N80-16961

WATER RESOURCES

NCSL remote sensing project — State Legislature considerations and activities
[E80-10053] N80-16401

Water resources data of the Seward area, Alaska
[PB80-101298] N80-16418

Occurrence availability and chemical quality of ground water in the Edwards Plateau region of Texas
[PB-299790/6] N80-16428

Heuristic decision rules for water resources planning
[PB-300578/2] N80-16435

WATER RUNOFF

Relationship of physiography and snow area to stream discharge — Kings River Watershed, California
[E80-10046] N80-16396

WATER TEMPERATURE

Observations of temperature, current, and wind variations off the central eastern coast of Florida during 1970 and 1971
[PB-301280/4] N80-16709

Effects of ingestion of cold and hot water on the course of thermal changes in the stomach and intestine
[NASA-TM-75515] N80-16728

WATER TREATMENT

Pretreatment of seawater for reverse osmosis processes, 1976
[PB-300509/7] N80-16134

Cooling tower water conditioning study — using ozone
[NASA-CR-162691] N80-16576

Evaluation of the ultraviolet-ozone and ultraviolet-oxidant treatment of pink water
[PB-300763/0] N80-16603

WATER WAVES

On the propagation of free topographic Rossby waves near continental margins
[PB-299949/8] N80-16704

WATERSHEDS

Relationship of physiography and snow area to stream discharge — Kings River Watershed, California
[E80-10046] N80-16396

Investigation of the application of HCMM thermal data to snow hydrology — Sierra Nevada Mountains, California and the Arizona test site
[E80-10049] N80-16397

Toward classification and rationale for watershed management and stream protection
[PB80-103153] N80-16417

Hydrologic data from urban watersheds in the Tampa Bay region
[PB-301204/4] N80-16447

WAVE ATTENUATION

Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods
[APL/JHU/SIR-79U-016] N80-16262

Stress wave attenuation in thin structures by ultrasonic through-transmission
[NASA-CR-3203] N80-16838

WAVE EQUATIONS
Interior Reissner-Nordstrom black holes
N80-16978

WAVE PROPAGATION
Some approximations in vibrations and wave motion of elastic media N80-16364
On the propagation of free topographic Rossby waves near continental margins
[PB-299949/8] N80-16704
Generalized Adams methods --- for underwater acoustic wave propagation problem
[AD-A074548] N80-16801
Whistler wave trapping in a density crest
[IPPJ-429] N80-16883

WEAPONS INDUSTRY
Evaluation of the ultraviolet-ozone and ultraviolet-oxidant treatment of pink water
[PB-300763/0] N80-16603

WEAR
Some considerations of the performance of two honeycomb gas path seal material systems
[NASA-TM-81398] N80-16143
Erosion-corrosion
[BNL-24884] N80-16154
Program to develop sprayed, plastically deformable compressor shroud seal materials
[NASA-CR-159741] N80-16338
Analysis of wear-debris from full-scale bearing fatigue tests using the ferrograph
[NASA-TM-81403] N80-16341
Blade design and operating experience on the MOD-OA 200 kW wind turbine at Clayton, New Mexico N80-16470
Evaluation of an operating MOD-OA 200 kW wind turbine blade N80-16471

WEAR TESTS
Mechanisms of lubrication and wear of a bonded solid lubricant film
[NASA-TM-81396] N80-16165

WEATHER
The weather in 1978 N80-16679
Mariners weather log, volume 23, number 4.
[PB-300277/1] N80-16681
The 19304DT GSRS, missile number 1030, round number V-55, 12 July 1979
[AD-A074962] N80-16687
The 19304DT GSRS missile number 1066, round number V-56 --- meteorological and weather data on a missile range
[AD-A074965] N80-16688
The 19304DT GSRS missile number 1035, round number V-57 --- weather and meteorological parameters for the missile range
[AD-A074980] N80-16689
The 19702A GSRS, missile number 303, round number B-28, 6 August 1979 --- weather and meteorological parameters recorded on the missile range
[AD-A074983] N80-16692

WEATHER FORECASTING
Verification procedures for the SEASAT measurements of the vector wind with the SASS
[NASA-CR-162469] N80-16407

WEATHER MODIFICATION
Weather modification --- congressional reports
[GPO-55-607] N80-16684
Project skywater. Skywater conference 10, June 1978: The Sierra cooperative pilot project design
[PB-298529/9] N80-16696

WEATHERPROOFING
AGT guideway and station technology. Volume 8: Weather protection concepts
[PB-299746/8] N80-16974

WEIGHTING FUNCTIONS
Weighting in digital synthetic aperture radar processing
[NASA-CR-162684] N80-16263

WELD STRENGTH
Influence of heat treatment on the microstructure and mechanical properties of Alloy 718 base metal and weldments
[HEDL-TME-78-54] N80-16156

WELDED JOINTS
Inert gas welding, volume 3: Citations from the Engineering Index data base --- a bibliography with abstracts
[NTIS/PS-79/0996/3] N80-16354

WELDED STRUCTURES
Localized corrosion and stress corrosion cracking behavior of austenitic stainless steel weldments containing retained ferrite
[COO-2462-5] N80-16149
Development of automated welding processes for field fabrication of thick-walled pressure vessel: Electron beam method
[DOE/ET-2606/3] N80-16348
Method of assessing the impact of metallurgical noise and its reduction in ultrasonic testing of austenitic welds
[GEFR-SP-164] N80-16349

WELLS
Gas production of Devonian shale wells relative to photo lineament locations: A statistical analysis
[METC/CR-79/28] N80-16410

WEST VIRGINIA
Environmental assessment of surface mining methods: Head-of-hollow fill and mountaintop removal
[PB-300540/2] N80-16622
Subsurface stratigraphy of the Middle and Upper Devonian clastic sequence in southern West Virginia and its relation to gas production N80-16628

WETLANDS
The Environmental Protection Agency's role in the protection of wetlands: Examination of EPA's participation in the section 404 regulatory program
N80-16574

WHEAT
Large Area Crop Inventory Experiment (LACIE). Detailed description of the wheat acreage estimation procedure used in the Large Area Crop Inventory Experiment
[E80-10051] N80-16399
Large Area Crop Inventory Experiment (LACIE). Profile similarity feasibility study
[E80-10052] N80-16400

WHISTLERS
Whistler wave trapping in a density crest
[IPPJ-429] N80-16883

WHITE DWARF STARS
Helium runaways in white dwarfs
[NASA-CR-162694] N80-16986

WIND MEASUREMENT
Verification procedures for the SEASAT measurements of the vector wind with the SASS
[NASA-CR-162469] N80-16407

WIND PROFILES
Linear spectral model of tropical mesoscale systems N80-16672

WIND SHEAR
Eddyless channel flows and their stability
[PB80-104649] N80-16427
A thunderstorm gust front detection system. Part 1: System operation and significant case studies. Part 2: Statistical results
[AD-A075922] N80-16677

WIND TUNNEL TESTS
Wind-tunnel/flight correlation study of aerodynamic characteristics of a large flexible supersonic cruise airplane (XB-701) 2: Extrapolation of wind-tunnel data to full-scale conditions
[NASA-TP-1515] N80-16032
Recent research on V/STOL test limits at the University of Washington aeronautical laboratory
[NASA-CR-3237] N80-16068

WIND VARIATIONS
Observations of temperature, current, and wind variations off the central eastern coast of Florida during 1970 and 1971
[PB-301280/4] N80-16709

WIND VELOCITY MEASUREMENT
Rapid-scanning measurements of wind-produced doppler on an asymmetrical microwave transhorizon propagation path N80-16674

WINDPOWER UTILIZATION
Large Wind Turbine Design Characteristics and R and D Requirements
[NASA-CP-2106] N80-16453
Overview of Federal wind energy program
N80-16454
Operational experience with VAWT blades --- structural performance N80-16468
Structural analysis considerations for wind turbine blades N80-16469
Blade design and operating experience on the MOD-OA 200 kW wind turbine at Clayton, New Mexico N80-16470
Evaluation of an operating MOD-OA 200 kW wind turbine blade N80-16471
Design, fabrication, and test of a steel spar wind turbine blade N80-16472
Preliminary analysis of performance and loads data from the 2-megawatt mod-1 wind turbine generator
[NASA-TM-81408] N80-16494
Decentralized energy: Technology assessment and systems description
[BNL-50987] N80-16502
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 1: Executive summary
[SAND-78-0962-VOL-1] N80-16539
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 2: Economic optimization model
[SAND-78-0962-VOL-2] N80-16540
Economic analysis of Darrieus vertical axis wind turbine systems for the generation of utility grid electrical power. Volume 3: Point designs
[SAND-78-0962-VOL-3] N80-16541
Economic analysis of Darrieus axis wind turbine systems for the generation of utility grid electrical power. Volume 4: Summary and analysis of the A. T. Kearney and Alcoa Laboratories point design economic studies
[SAND-78-0962-VOL-4] N80-16542

WINDPOWERED GENERATORS
Large Wind Turbine Design Characteristics and R and D Requirements
[NASA-CP-2106] N80-16453
Design evolution of large wind turbine generators
N80-16455
The General Electric MOD-1 wind turbine generator program N80-16456
The Boeing MOD-2 wind tunnel system rated at 2.5 MW N80-16457
WTG Energy Systems' MP1-200 200 kilowatt wind turbine generator --- a fixed pitch rotor configuration driving a synchronous generator N80-16458
Specification, siting and selection of large WECS prototypes N80-16459
The Danish large wind turbine program --- feasibility of wind power in a utility grid N80-16460
Large wind energy converter: Growian 3 MW
N80-16461
Characteristics of future Vertical Axis Wind Turbines (VAWTs) --- to generate utility grid electric power
N80-16462
Design characteristics of the 224 kW Magdalen Islands VAWT N80-16463
Alcoa wind turbines N80-16464
Test results of the DOE/Sandia 17 meter VAWT
N80-16465
Overview of Vertical Axis Wind Turbine (VAWT)
N80-16466
Fabrication of extruded vertical axis turbine blades
N80-16467
WTG Energy Systems' rotor: Steel at 80 feet
N80-16473
The use of wood for wind turbine blade construction N80-16474
Large, low cost composite wind turbine blades
N80-16475
The MOD-1 steel blade N80-16476
The Boeing MOD-2 wind turbine system rotor
N80-16477
Status of the Southern California Edison Company 3 MW Wind Turbine Generator (WTG) demonstration project N80-16478
Results of a utility survey of the status of large wind turbine development N80-16479
Simulation studies of multiple large wind turbine generators on a utility network N80-16480
System configuration improvement N80-16481
Cost of energy evaluation N80-16482
Preliminary analysis of performance and loads data from the 2-megawatt mod-1 wind turbine generator
[NASA-TM-81408] N80-16494

WING PROFILES
Application of numerical optimization to the design of wings with specified pressure distributions
[NASA-CR-3238] N80-16031

WING ROOTS
Wing flapping with minimum energy --- minimize the drag for a bending moment at the wing root
[NASA-TM-81174] N80-16035

WINGS
Average gust frequencies subsonic transport aircraft
[ESDU-69023-A-B-C] N80-16029
WINTER
Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods
[APL/JHU/SIR-79U-016] N80-16262
Solar availability for winter space heating: An analysis of the calendar period 1953-1975
[ANL/SPG-14] N80-16532
WIRELESS COMMUNICATIONS
Geostationary operational environmental satellite/data collection system
[PB-301276/2] N80-16087
WIRING
Testing the interlaminate adhesion of multilayer printed wiring boards
[BDX-613-2011] N80-16169
WOOD
Assessment of the technical and economic feasibility of converting wood residues to liquid and gaseous fuel products using state-of-the-art and advanced coal conversion technology
[COO-4862-3] N80-16189
The use of wood for wind turbine blade construction N80-16474
WYOMING
Geologic application of thermal-inertia mapping from satellite — Powder River Basin, Wyoming and Cabeza Prieta, Arizona
[E80-10050] N80-16398

X

X RAY ANALYSIS
Pulse pileup effects of plasma electron temperature measurements by soft X-ray energy analysis
[ORNL/TM-6541] N80-16867
X RAY ASTRONOMY
X-ray observations of a compact binary source
[NASA-CR-162750] N80-16989
X RAY DIFFRACTION
X-ray pole figure analysis
[BDX-613-1829-REV] N80-16876
X RAY SOURCES
UBVR observation of V1357 Cyg = Cyg X-1. Search of the optical radiation of the accretion disk
[NASA-TM-75677] N80-16988
X-ray observations of a compact binary source
[NASA-CR-162750] N80-16989

Y

YELLOWSTONE NATIONAL PARK (ID-MT-WY)
U.S. Geological Survey sources of photographs and images of biosphere reserves taken from spacecraft and aircraft: Yellowstone National Park
[PB-301333/1] N80-16429
YIELD POINT
Dynamic yielding of polycrystalline materials under biaxial loading N80-16366
YIELD STRENGTH
A differential geometric approach to material deformation N80-16365
YTTRIUM ALLOYS
Magnetic critical temperature gap in Gd-Y alloys
[ISM-228] N80-16916

Z

ZETA PINCH
Production and diagnostics of dense nuclear plasmas
[NASA-CR-162656] N80-16884
ZINC
Geology and skarn ore mineralization of the Yeonhwa-Ulchin zinc-lead mining district, southeastern Taebaegsan region, Korea N80-16634
ZINC ALLOYS
X-ray pole figure analysis
[BDX-613-1829-REV] N80-16876
ZIRCONIUM ISOTOPES
Relative isotopic abundances of zirconium in S-type stars N80-16991

blank page

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

Listings in this Index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ACUREX CORP., MOUNTAIN VIEW, CALIF.
Environmental assessment of stationary source NOx control technologies N80-16601
[PB-300469/4]

ADDIS TRANSLATIONS INTERNATIONAL, PORTOLA VALLEY, CALIF.
Hydrodynamic equilibrium of plasma in an ambipolar trap N80-16887
[UCRL-TRANS-11493]
Plasma physics and problems of controlled thermonuclear reactions N80-16888
[UCRL-TRANS-11487]

AEROJET LIQUID ROCKET CO., SACRAMENTO, CALIF.
JEFF(A) mixed-flow model fan performance optimization N80-16234
[AD-A074571]

AEROSPACE CORP., LOS ANGELES, CALIF.
Fusion laser studies N80-16897
[NVO-1559-1]

AEROSPACE MEDICAL DIV. AEROSPACE MEDICAL RESEARCH LABS. (6570TH), WRIGHT-PATTERSON AFB, OHIO.
Research related to the expansion and improvement of human vibration exposure criteria N80-16217

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Computer aided design of passive vibration isolators for airborne electro-optical systems N80-16218
A generalized derivative model for an elastomer damper N80-16223
Electric and magnetic fields of an intense pulse of relativistic electrons propagating through air N80-16257

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Design of turbine blades for effective slip damping at high rotational speeds N80-16219
A simple low-cost technique for measuring material damping behavior N80-16220
The development of quantitative NDI for retirement-for-cause N80-16355
[AD-A068403]

AIR FORCE SYSTEMS COMMAND, BROOKS AFB, TEX.
Wizard: A string-oriented microprocessor operating system N80-16744
[AD-A074704]

AKRON UNIV., OHIO.
A general approach to ordering of parameters with application in reliability N80-16357
[AD-A074246]

ALABAMA UNIV. IN HUNTSVILLE.
An experimental design for total container impact response modeling at extreme temperatures N80-16207

ALASKA DEPT. OF NATURAL RESOURCES, ANCHORAGE.
Water resources data of the Seward area, Alaska N80-16418
[PB80-101298]

ALLIED CHEMICAL CORP., IDAHO FALLS, IDAHO.
Computerized quality control techniques N80-16361
[CONF-790707-11]

ALUMINUM CO. OF AMERICA, ALCOA CENTER, PA.
Alcoa wind turbines N80-16464
Fabrication of extruded vertical axis turbine blades N80-16467

AMERICAN SCIENCE AND ENGINEERING, INC., CAMBRIDGE, MASS.
Energy release in solar flares. Proceedings of the workshop on Energy Release in Flares N80-17010
[PB-300905/7]

AMERICAN UNIV., WASHINGTON, D. C.
A study of the photodegradation of poly (methyl methacrylate) N80-16159
An optical investigation of the correlation between mass transport and mechanical properties of strained polymer films N80-16161
Application of plate tectonics to the location of new mineral targets in the Appalachians N80-16442
[PB-300512/1]

AMES LAB., IOWA.
Preliminary experimental results on the optical properties of model direct solar gain interiors N80-16519
[ISM-233]
Magnetic critical temperature gap in Gd-Y alloys N80-16916
[ISM-228]
ALLS, a generalized crystallographic least squares program N80-16918
[IS-4708]

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
Comparison of radar derived rain attenuation with the Comstar beacon at 28.56 GHz for summer and winter periods N80-16262
[APL/JHU/SIR-79U-016]

[PB80-100423] N80-16961
WTG ENERGY SYSTEMS, INC., BUFFALO, N.Y.
WTG Energy Systems' MP1-200 200 kilowatt wind turbine generator N80-16458
WTG Energy Systems' rotor: Steel at 80 feet
N80-16473
WYLE LABS., INC., COLORADO SPRINGS, COLO.
Truck design optimization project. Phase 2: Analytical tool assessment report
[PB80-104888] N80-16960
WYLE LABS., INC., HUNTSVILLE, ALA.
Outdoor test for thermal performance evaluation of the Owens-Illinois Sunpack SEC-601 (air) solar collector
[NASA-CR-161339] N80-16492

Y

YESHIVA UNIV., NEW YORK, N. Y.
Pinched relativistic electron beams and collective acceleration of ions N80-16274
Dielectric and pyroelectric properties of ferroelectrics N80-16275
YOUNG (ARTHUR) AND CO., WASHINGTON, D. C.
Information transfer in the Office of Research and Development
[PB80-101371] N80-16972

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS

Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA - Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NAS 1.9/4:

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C., 20402, United States of America.

Semimonthly issues...

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual ...

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic, $11.90 foreign; annual $16.00 domestic, $20.00 foreign.

Domestic subscription rates...

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates...

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH
Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by Informatics Information Systems Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

NEWARK PUBLIC LIBRARY

MAY 16 1980

U. S. GOVT. PUBS.
DEPOSITORY 376

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available fron, the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 18 NUMBER 8/APRIL 23, 1980

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 949

02 AERODYNAMICS 949

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 951

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 952

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 954

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION N.A.

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 956

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 958

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 959

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) 960

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 963

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 963

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 964

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 965

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING N.A.

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 965

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION N.A.
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 966
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 968
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 968
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 970
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 973
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 979
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 982
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics*.

31 ENGINEERING (GENERAL) 983
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 991
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 996
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 1001
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 1005
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 1008
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 1011
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 1015
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 1016
Includes structural element design and weight analysis; fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) N.A.

43 EARTH RESOURCES 1021
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.
For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 1023
Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 1030
Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 1032
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.
For space radiation see *93 Space-Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 1035
Includes weather forecasting and modification.

48 OCEANOGRAPHY 1038
Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 1039
Includes genetics.

52 AEROSPACE MEDICINE 1044
Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 1045
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 1046
Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.
Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) 1047

60 COMPUTER OPERATIONS AND HARDWARE 1048
Includes computer graphics and data processing.
For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 1049
Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 1052
Includes computer networks.

63 CYBERNETICS 1052
Includes feedback and control theory.
For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 1054
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 1058
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 1060
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS 1060
Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.
For related information see also *Engineering*.

70 PHYSICS (GENERAL) 1060
For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 1061
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 1062
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 1064
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 1064
Includes light phenomena.

75 PLASMA PHYSICS 1066
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 1067
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 1070
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 1071
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 1072
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS 1073
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE 1073
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 1074
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTRONOMY 1076
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 1077
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION 1077
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 1078
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION 1082
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

STUDY OF THE FEASIBILITY ASPECTS OF FLIGHT TESTING AN AEROELASTICALLY TAILORED FORWARD SWEPT RESEARCH WING ON A BQM-34F DRONE VEHICLE
D. J. Mourey 3 Sep 1979 409 p refs
(Contract NAS1-15624)
(NASA-CR-159149) Avail NTIS HC A18/MF A01
CSCL 01C

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.
A.W.H.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects — not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0001, G-SEAT OPTIMIZATION
D.C. McGuire, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Williams Air Force Base, Chandler, Arizona* 85224 (DF223950)

To investigate optimization of g-seat configurations, use of improved components, and software optimization.

A bench test set-up will be used to investigate hardware configurations, components, and adjustments. The configuration will include compressor, conoflow valve, booster valve, a g-seat bellow with instrumentation (potentiometer and accelerometer) and strip chart recorder. Software analysis will consist of organization and optimization by reducing unnecessary arrays, maximizing linear flow and eliminating unnecessary branching. The results will be applied to the g-seat systems of ASPT to improve their performance such as in lowered time constants, rise times, transport lags, and software execution time. Improved performance will make feasible emulation and evaluation on ASPT of new system design such as the A-10 simulator seat under development by Reflectone.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

1.0002, SUPERSONIC CRUISE/TRANSONIC MANEUVER WING SECTION DEVELOPMENT
C.D. Wiler, Rockwell International Corp., *International Airport, Los Angeles, California* (DF139870; F33615-77-C-3066)

Current advanced tactical aircraft missions include requirements for efficient supersonic cruise configurations capable of effective transonic maneuver. This effort is directed toward the application of advanced aerodynamic technologies in achieving such performance and represents a significant step toward the achievement of an improved force capability pending favorable results.

A wing design, which will include specification of thickness, camber, taper, and twist, will be evolved using analytical, design, and/or experimental techniques consistent with the current state of the art. Appropriate revolutionary configurations and approaches which represent advanced aerodynamic technologies will be incorporated into the design in order to overcome the aerodynamic configuration incompatabilities of the supersonic cruise and transonic maneuver flight regimes.

1.0005, NAVY VEHICLE DESIGN AND CONSTRUCTION - DEVELOPMENT OF HIGH-ANGLE-OF-ATTACK SYSTEM IDENTIFICATION TECHNOLOGY
W.E. Hall, Systems Control Inc., *260 Sheridan Ave., Palo Alto, California* 94306 (DN875586; N00014-78-C-0641)

System identification technology for use in flight testing aircraft has been developed in order to reduce flight test time and costs, and to improve the accuracy of flight test estimated aircraft characteristics. Initial applications have been limited to analysis of linear aircraft response at low angles of attack. During combat maneuvers, aircraft operate at high angles of attack where aerodynamic characteristics become highly nonlinear. The objective of this project is to develop the capability to quantify nonlinear stall/departure characteristics of high performance jet aircraft from flight test data using an advanced integrated approach to system identification.

Data are being obtained from a flight test program to expand the high-angle-of-attack envelope of F-4S aircraft. The program is being conducted in two phases. The first phase has been completed. The final phase will consist of high-angle-of-attack flight tests based on input design results, nonlinear model structure determination and verification, parameter identification to estimate nonlinear aerodynamic coefficients, development of an aerodynamic data base, and estimates of the F-4S airplane high-angle-of-attack departure boundaries.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

1.0006, AERONAUTICAL TECHNOLOGY, TECH AREA M - AVIATION HUMAN ENGINEERING
I.C. Statler, U.S. Dept. of Defense, Army, Aviation Research & Development Command, Aeromechanics Lab., *Moffett Field, California* 94035 (DA0D5001)

Improve Army air mobility systems by providing improved knowledge, criteria and technology for man-machine integration and by providing better engineering methods for performing the AVSCOM man-machine integration functions.

Systematic exploratory R&D in human performance technology, flight simulation methods and requirements, control and display technology, and man-machine dynamics. The approach emphasizes analytical and experimental studies using laboratory, simulation, mathematical modeling and flight test facilities. These activities have been coordinated with and will complement and support the handling qualities R&D of Tech Area A and the flight simulator development of Tech Area K. Objectives will be achieved largely through joint participation with NASA, making maximum use of the facilities and expertise available within NASA for man-machine systems research.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Aeromechanics Lab.

1.0007, AERONAUTICAL TECHNOLOGY, TECH AREA K - FLIGHT SIMULATION
I.C. Statler, U.S. National Aeronautics & Space Admin., Ames Research Center, *Moffett Field, California* 94035 (DA0D5004)

Perform analyses and design studies to determine the requirements of a rotary-wing R&D flight simulator capable of simulating NOE flight operations. This effort complements the hardware development being conducted under 6.3, Project DB34.

In joint participation with NASA, perform the studies with the expectation of providing modifications and additions to an available NASA simulator to meet the Army's mission requirements.

1.0012, AIR CUSHION SYSTEM TRUNK FLUTTER MODEL DEVELOPMENT
A.B. Boghani, Foster Miller Associates Inc., *135 2nd Ave., Waltham, Massachusetts* 02154 (DF141860; F33615-78-C-3412)

This effort supports the development of air cushion systems (ACS) for Air Force aircraft takeoff and landing. Under some ACS-equipped aircraft ground operating conditions, ACS trunks experience a flutter phenomenon which causes the aircraft to become dynamically unstable, introducing ground operation problems. The objective of this research study is to establish a better understanding of ACS trunk flutter and to develop an analytical technique for the evaluation of the flutter characteristics for ACS trunk designs. This technique will be applied for optimization and evaluation of ACS trunk designs to eliminate/minimize trunk flutter and to significantly improve ACS-equipped military aircraft ground operation.

Existing studies and test data will be analyzed to establish the principal variables and conditions causing ACS trunk flutter. Then, an analytical technique will be developed for evaluation of the flutter characteristics for ACS trunk designs. Next, the technique will be verified by its use to evaluate the flutter characteristics of the XC-8A aircraft's ACS trunk under various conditions. The results will be compared with flight test data. Initial ACS trunk design criteria will be developed for elimination of flutter and a final report prepared.

1.0017, DEVELOPMENT OF ADVANCED FLIGHT CONTROL ACTUATION SYSTEM CONCEPTS FOR NAVY AIRCRAFT
J. Leonard, Grumman Aerospace Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DN981062; N62269-78-C-0218)

The general objective of this task is to examine the broad spectrum of new flight control actuation concepts with respect to potential advantages and interrelationships with other aircraft systems. The resultant effect of these new concepts will be evaluated against projected aircraft mission and maintenance requirements. Recent advancements in on-board computers, electrical power equipment and solid-state processing components may offer advantages to new aircraft, especially with growing emphasis on combat survivability and simplified squadron maintenance. This contract supports work unit ZA601, Agency Accession No. DN 681080.

An investigation will be conducted to determine the feasibility of integrating an all-electric rotary actuator in a proposed aircraft. The investigation will determine potential benefits and design concepts for mechanization of such a system. A follow-on program may include development of hardware, testing and eventual flight demonstration.

SUPPORTED BY U.S. Dept. of Defense, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate

1.0018, TRANSONIC WIND TUNNEL EXPERIMENTS ON OSCILLATING AIRFOILS
S.L. Petrie, Ohio State University Research Foundation, *1314 Kinnear Rd., Columbus, Ohio* 43212 (DF138650; AFOSR-76-3021)

This work unit supports the aeroelastic evaluation of high-speed aircraft. It will contribute to the development of im-

proved unsteady aerodynamic methods to predict aircraft aeroelastic stability and structural dynamic response. The goal is to develop a low-cost research facility to conduct unsteady aerodynamic tests on oscillating models in transonic wind tunnels, resulting in ultimate savings in the costs to design new aircraft. The presence of a national capability to make these measurments will allow the orderly development of necessary analytical methods to optimize aircraft structures for minimum weight and cost.

A contractor will be selected to survey the ambient interference in a small transonic wind tunnel without a model present. An oscillating model will then be inserted into the tunnel and studies performed to determine Mach number, Reynolds number and wall interference effects on unsteady pressure measurements.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0019, STRAIN GAGE ATTACHMENT TO COMPOSITES

J.L. Mullineaux, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF141470)

This work unit supports the structural testing of aircraft components made from composites containing epoxy matrix material. The strength of the composite matrix is affected by a combination of elevated temperature and high humidity environments. Strain gage transducers can be used to determine the effects if the transducers are themselves impervious to the environment. This work unit will investigate techniques to obtain reliable data from strain gages installed on composite parts which are exposed to elevated temperature and humidity. The data from such transducers will greatly contribute to the flight safety of military aircraft.

This program will investigate non-epoxy adhesives as bonding agents and RTV silicon materials as coatings for strain gage installations on composites.

1.0021, STRUCTURAL DEGRADATION AND HAZARDS FROM HELICOPTER STRUCTURE EXPOSED TO FIRE AND/OR EXPLOSIONS (ABBREV)

R. Schiltz, Bell Helicopter Textron, *Hwy. 183, P.O. Box 482, Fort Worth, Texas* 76101 (DA0E3859; DAAK51 79 C 0009)

To investigate the effects of fire/explosion on the structural integrity of composite materials and the personnel hazards (toxicity, smoke, etc.) resulting from same.

Following a literature and organizational survey to establish design guidelines and requirements, composite specimens will be fabricated and laboratory tested to ascertain the structural degradation and resulting hazards (smoke, toxicity, etc.) to personnel when burning/explosion occurs. Based on the test findings, design guidelines will be developed to minimize the structural and personnel harmful effects due to composites exposed to post-crash, in-flight or explosive-induced fire. A computer program simulating the result of a helicopter composite structures fire will be demonstrated at ATL, Ft. Eustis, VA, upon completion of the technical effort.

SUPPORTED BY U.S. Dept. of Defense, Aviation Research & Development Command, Applied Technology Lab.

1.0022, FORWARD SWEPT WING ANALYSIS

S.K. Hadley, General Dynamics Corp., *P.O. Box 748, Fort Worth, Texas* 76101 (DF140910; F33615-77-C-3133)

There are several planned approaches to improved performance of high-speed fighter aircraft in transonic maneuvering. Current deficiencies in this area indicate the need for major innovation to achieve large advantages in air combat maneuvering. One such innovation utilizes forward swept wings to overcome many present aerodynamic deficiencies. Until recently this concept suffered from loss of static stability due to wing tip deflection departure. The recent breakthroughs in aeroelastic tailoring at wing structure may lead to resolution of this tip departure problem and realization of substantial performance improvement. A detailed analysis is required to examine the full potential of forward swept wings for advanced fighter aircraft.

An investigation of the aerodynamic and aeroelastic implication of forward swept wings will be carried out using current analysis methods. Studies will be cast in a framework of planned mission requirements using advanced aft-swept baselines.

2.0002, EFFECTS OF PAYLOAD HANDLING CONSIDERATIONS ON SPACE SHUTTLE TRAJECTORIES DURING PROXIMITY OPERATIONS

W.T. Fowler, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering & Engineering Research, *200 W. 21st, Austin, Texas* 78712

Research is being conducted into the proximity operations, or rendezvous, phase of space shuttle missions involving payload recovery. One and two impulse trajectories from station-keeping locations within 1000 feet of the target body payload are being considered. A one impulse trajectory is defined to have a final relative velocity less than or equal to 0.2 ft./sec. This value is the maximum allowable rate (at maximum payload mass of 3200 lb.) for RMS capture. All successful rendezvous trajectories must meet rigid constraints on plume impingement, crew visibility, total fuel consumption, total coast time (time from first impulse to final approach), and safety.

2.0003, NUMERICAL METHODS IN OPTIMAL CONTROL

D.G. Hull, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering, *200 W. 21st, Austin, Texas* 78712

DESCRIPTION: Current research in this area is being directed toward optimal control using parameter optimization with numerical derivatives. One problem being investigated concerns system identification applied to the reduction of flight test

data for atmospheric reentry vehicles. Another problem concerns the development of a method for computing numerical derivatives accurately.

SUPPORTED BY University of Texas

2.0004, ORBITAL MECHANICS OF LARGE SPACE STRUCTURES

B.E. Schutz, University of Texas, Austin Campus, School of Engineering, Dept. of Aerospace Engineering & Engineering Mechanics, *200 W. 21st, Austin, Texas* 78712

DESCRIPTION: Various applications using large structures in space have been proposed including solar power stations and space colonies. Some of the proposals utilize orbits which are resonant with the moon, the sun, the earth's gravitational field, etc. As a consequence, large amplitude oscillations occur in some cases which could significantly influence the selection of particular orbits for large space structures. Current analysis is concentrating on 1) general characteristics of orbital motion in these resonant cases; 2) ascertaining the existence of small amplitude motions; and 3) the general characteristics of the rotational motion of a large structure.

3.0001, HYDROGEN UPON AND WITHIN MATERIALS USING NUCLEAR MAGNETIC RESONANCE

R.W. Vaughan, California Inst. of Technology, School of Engineering, Dept. of Chemistry & Chemical Engin, *1201 E. California Blvd., Pasadena, California* 91109 (DMR7721394A02)

This grant permits purchase of a super-conducting magnet to complete construction of a state-of-the-art, high-field, high-resolution nuclear magnetic resonance (NMR) spectrometer for the study of solids and solid surfaces. NMR spectroscopy of liquid solutions has become an extremely important technique in chemistry. Application of NMR to solids, however, has been limited because of solid-state interactions. The purpose of the new spectrometer system is two-fold. The first is to significantly enlarge the scope of Professor Vaughan's work in the development of high-resolution, solid-state NMR. Specifically, techniques are being developed for the study of non-integral spin systems. These include nuclei of interest for solid-state chemical research such as lithium-7, boron-11, and sodium-23. The second purpose is to extend the range and rapidity of research, carried out by workers from the California Institute of Technology and from other institutions, on surface species on oxide catalysts and dispersed metal catalysts, and inorganic hydrides, metal cluster complexes, and metallic systems.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0002, CORROSION INHIBITION OF BEARING ALLOYS

J.W. Butler, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980145)

The objective of this work unit is a process for treating the high-quality bearing and transmission alloy AISi-52100 so that it will not corrode in normal usage.

The approach is to apply ion implantation techniques to produce a graded alloy near the surface, with the alloy at the surface being corrosion-resistant and with a smooth transition from this new surface alloy to the basic AISi-52100 substrate alloy. Specific alloying elements to be implanted and tested will be chromium, molybdenum, tantalum, and titanium.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

3.0003, INITIATION OF CRACKS IN LCF OF TI ALLOYS

G.R. Yoder, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980076)

Determine the relationship between low-cycle fatigue crack initiation resistance and fatigue crack propagation resistance for select microstructural modifications, so that a fundamental basis for metallurgical optimization of total fatigue life can be established. Establish rational micromechanistic interpretation of results.

Systematically determine the low-cycle fatigue crack initiation resistance of Ti-6Al-4V for microstructural modifications which are already well characterized in terms of fatigue crack propagation resistance, mechanical properties and quantitative metallographic parameters. The different microstructures, as affected by changes in heat treatment and interstitial oxgen content, are to be examined for crack initiation resistance under conditions of constant stress amplitude.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

3.0004, HIGH-TEMPERATURE MOLECULES AND MOLECULAR ENERGY STORAGE

W. Weltner, State University System of Florida, University of Florida, School of Arts & Sciences, Dept. of Chemistry, *208 Tigert Hall, Gainesville, Florida* 32601 (DF042010; AFOSR-76-2906)

AF function - rocket propulsion, electromagnetic weaponry. Deficiency - structural and spectroscopic information on molecular species found in high-temperature systems such as wakes, plumes, nozzles, lasers and combustors is required for improved design features of Air Force systems. Objective - research includes optical and electron spin resonance (ESR) spectroscopy of molecular species and the spin-alignment of radicals at high magnetic fields and low temperatures. How work contributes - the optical and ESR spectra of high-temperature species provide information on vibrational, electronic and magnetic energy levels which is useful in plume identification and suppression and in the development of advanced lasers. Spin-aligned radicals provide a potentially important source of advanced, high-energy propellants.

Species are vaporized and trapped in solid argon matrices at 4-10 degrees K for the study of their optical and ESR spectra. Species to be examined include carbon molecules (C5, C6), silicon species (SiC, SiN, SiO2), the oxides, hydrides, fluorides and nitrides of the transition metals Mn, V, Fe, Cr, Ni and Yb, and HI2 and HCl2. A molecular energy storage apparatus has been constructed to allow spin alignment of radicals at high magnetic fields and low temperatures and will be tested.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0005, NAVY VEHICLE DESIGN AND CONSTRUCTION - RESIDUAL STRESS ANALYSIS IN METALS AND ALLOYS

J.B. Cohen, Northwestern University, Evanston Campus, Technological Inst., Dept. of Materials Science, *633 Clark St., Evanston, Illinois* 60201 (DN923045; N00014-78-M-0079)

The service life of critical naval components such as gears, bearings, and helicopter blades depends on the fatigue resistance developed by heat treatment and surface processing. This program will invesitgate the nature and effect of residual stresses on the fatigue behavior of these materials.

The plastic zone in front of a fatigue crack will be examined in Al-Cu and Al-Zn alloys using a small X-ray beam to determine the nature of the fatigue damage. This will be related to the fatigue hardening and fatigue softening observed in these alloys. Residual stress analysis will be explored to find out why the X-ray measured stress depends on the particular X-ray diffraction peaks used in the determination. Technical coverage of an important meeting will be provided in the form of written review.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0006, MECHANISMS OF HYDROGEN EMBRITTLEMENT IN METALS AND ALLOYS USED IN NAVAL STRUCTURES

H.K. Birnbaum, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Mining Engineering & Metallurgy, *207 Engineering Hall, Urbana, Illinois* 61801 (DN123376; N00014-75-C-1012)

This research undertakes to clarify the mechanisms by which hydrogen can embrittle metals and alloys, such as those used for naval aircraft and ship structures.

Crack initiation and propagation mechanisms in metal--hydrogen alloys are being investigated over a range of hydrogen contents, temperatures and stress conditions. Standard metallurgical techniques are being used.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0007, A THEORETICAL INVESTIGATION OF SPECTRAL LINE SHAPE

K.M. Sando, University of Iowa, School of Liberal Arts, Dept. of Chemistry, *Jessup Hall, Iowa City, Iowa* 52240 (CHE79-12456)

This grant supports research under the Quantum Chemistry Program to develop mathematical models for the shapes of spectral lines in gases. These models provide fundamental information about interatomic interaction energies, which is important for understanding how atoms exchange energy with one another and with electromagnetic radiation during collisions. The models can be used to interpret and predict the results of experiments which are now possible with modern laser technology.

Professor Sando will extend his theoretical investigations to include satellite bands that are observed in the resonance broadening of cesium. The concept of pairwise additivity of interatomic potentials will be incorporated in atomic line shape theory. New computational methods will be developed to fit the potential to a full line shape and to include coupling among atomic states in a computer simulation code. Several commonly used approximations in line shape theory will be tested numerically. An objective of the research is to invert line shapes to recover the interatomic potential.

This is a renewal of research currently supported by NSF grant CHE-7611968 at The University of Iowa.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0008, ELECTRONIC STRUCTURES AND CHEMICAL BONDING OF SMALL METAL AND ALLOY AGGREGATES

K.H. Johnson, Massachusetts Inst. of Technology, School of Engineering, Dept. of Metallurgy & Materials Science, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DMR7818800)

Research previously supported by DMR7415224.

Theoretical studies of the electronic structure of solids will be carried out, including the completion of work on transition-metal impurities in copper and the extension of cluster molecular-orbital calculations to transition-metal impurities in aluminum. The calculation of residual resistivities, spin densities, electric and magnetic hyperfine parameters on the basis of the cluster spin-orbitals is planned, along with the further investigation of Jahn-Teller effects and spin-orbit coupling. A reformulation of the Anderson model Hamiltonian, particularly the 'U parameter,' to account for the large bonding-antibonding interaction and much reduced exchange splitting of the impurity orbitals will be attempted, along with a parameterization of a model spin Hamiltonian on the basis of the cluster electronic structures. Possible relationships between the concept of 'cluster renormalization' and the renormalization-group method of attacking the Kondo problem will be explored, including a computational procedure analogous to that of the renormalization-group method for determining the effects of successive surrounding shells of atoms on the impurity. The cluster molecular-orbital method will also be applied to Fe impurities in palladium as a basis for explaining the occurrence of 'giant magnetic moments' in such a dilute alloy system. Extensions of the cluster method to nondilute transition-metal alloys, including impurity-impurity interaction, solid-solution alloys, and intermetallic compounds are also part of our long-range research objectives. Finally, concurrent continuing theoretical studies of metallic and bimetallic clusters of catalytic importance will be done. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0009, HIGH-TEMPERATURE PROPERTIES OF EUTECTICS, DIRECTIONALLY SOLIDIFIED ALLOYS AND MONOCRYSTALS FOR POTENTIAL ARMY AIRCRAFT ENGINE

P.J. Ahearn, U.S. Dept. of Defense, Army, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center, *Watertown, Massachusetts* 02172 (DA0C4808)

Properly chosen eutectics, directionally solidified alloys or monocrystals may provide the optimum method for making turbine blades and vanes.

Mechanical properties of eutectics and other alloys are influenced by the solidification parameters. Currently properties are optimized by rapid cooling, directional solidification, solidification as a monocrystal, etc. These methods have limitations and thus experimets are being conducted to improve upon the techniques and also to devise new methods of solidification. Current interest is centered upon experiments involving controlled liquid flows artificially introduced at the liquid-solid interface during solidification.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Materials & Mechanics Research Center

3.0010, RESEARCH ON CORROSION AND CORROSION-RESISTANT STRUCTURAL AND PROPULSION SYSTEMS MATERIALS

S.J. Ketcham, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN833088)

Since the overall structural integrity of naval aircraft has a critical dependence on the elimination of catastrophic failures due to corrosion and/or embrittlement, work in this unit involves research on the interactions of environment and stress on high-strength alloys and composite materials as they relate to corrosion susceptibility and propensity to environmental cracking, and on ways to measure and mitigate these factors.

Research is being pursued on the mechanisms and detection of microstructural corrosion and environmental cracking of high-strength steels and aluminum alloys by advanced state-of-the-art metallurgical and electrochemical techniques; on the corrosion response of advanced systems, e.g., sintered and composite materials; and on new laboratory accelerated corrosion tests and corrosion/embrittlement detection systems for fleet use.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

3.0011, INVESTIGATION OF REINFORCED THERMOPLASTIC COMPOSITES

J.T. Hoggatt, Boeing Co., Boeingaerospace, *7555 E. Marginal Way S., Seattle, Washington* 98124 (DN890171; N00019-79-C-0203)

To evaluate fiber-reinforced thermoplastics for aircraft and missile structures.

To develop methods for impregnation and fabrication of high-temperature thermoplastic materials. Evaluate significant mechanical and physical properties of laminates. Initiate synthesis and reformulation efforts to develop improved polymer systems.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

ENGINEERING

Assurance and Reliability; and Structural Mechanics. For Related Information See Also Physics.

4.0001, TURBULENT SHEAR FIELDS
B.Z. Jenkins, U.S. Dept. of Defense, Army, Missile Research & Development Command, Technology Lab., *Redstone Arsenal, Huntsville, Alabama* 35809 (DA0G1107)

The objective is to analytically and experimentally characterize the FAR field rocket exhaust as a source of operational and flight interference. In particular, the evaluation of large remanent turbulence eddies in proximity to the launch structure and the ground are to be studied in view of their tendency to produce a persistent disturbed aerodynamic and uv/ir/optical propagation environment.

Rocket sled facilities will be used to better define the properties of the exhaust plume at great distances from the exit. Computer codes for predicting the effects of these flow fields on obscuration due to smoke and/or dust entrainment and on objects immersed in them will be acquired or developed.

S.F. Isher, Navajo Community College, Undergraduate School, *Tsaile, Arizona* 86556 (NSG 737)

SUPPORTED BY U.S. National Aeronautics & Space Admin., National Space Technology Lab.

4.0003, ROLE OF MICROSTRUCTURE IN EPITAXIAL REGROWTH IN METAL-SEMICONDUCTOR INTERFACES 15999-MS
R.A. Armistead, Advanced Research & Applications Corp., *1223 E. Arques Ave., Sunnyvale, California* 94086 (DA0G8993; DAAG29-79-C-0014)

To study the mechanism of solid-phase epitaxial regrowth in metal-semiconductor systems. Relevance - the research is relevant to processing of silicon for integrated circuits which are used in a multitude of Army electronics components for communications, signal processing, computers, etc. It is also relevant to the understanding of the behavior of integrated circuits subjected to radiation environments.

The program will include (1) growth of Al/Si structures. (2) ion implantation of Al and protons in Al film; protons, Si, B, As, In and Si film; Si, B, As, In and Si film to create amorphous Si. (3) characterization of specimens using TEM/TED/SEM, AES. (4) measurement of I-V and C-V characteristics.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0004, RESEARCH ON TURBULENT MIXING
A. Roshko, California Inst. of Technology, Graduate School, Dept. of Aeronautics, *1201 E. California Blvd., Pasadena, California* 91109 (DN975341; N00014-79-C-0365)

The objective of this study is to develop a better understanding of the mechanics of turbulent structure and mixing, including large-scale entrainment processes, smaller scale molecular mixing processes, and the interaction between them. This information is needed for improved prediction of both reactive and non-reactive mixing processes within various components of turbojet and ramjet engines and to provide a basis for better control of such mixing. Ultimately it should lead to improved propulsion systems for naval weaponry applications.

A mixing region will be formed between two adjacent nonidentical liquid or gaseous streams. The dependence of the mixing process on various relevant parameters will be investigated through a combination of coupled flow visualization studies and quantitative measurements. Flow visualization will be accomplished in the liquids by means of conventional and fluorescent dye tracers and infinite rate chemical indicators, and in the gases with shadowgraph or schlieren photographs of gaseous tracers of different density than the mixing gases. Quantitative measurements will be made using laser velocimetry for the liquids and species concentration sampling probes in the gases.

4.0005, CALCULATIONS FOR TURBULENT FLOWS IN DUCTS
T. Cebeci, McDonnell Douglas Corp., *3855 Lakewood Blvd., Long Beach, California* 90808 (DN890141; N00019-78-C-0613)

Development of methods for the calculation of turbulent flows in ducts. Analytical study.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

4.0006, ACQUISITION OF A SYSTEMATIC DATA BASE FOR WING-ALONE CHARACTERISTICS AT HIGH ANGLES OF ATTACK 16030-E
J.N. Nielsen, Nielsen Engineering & Research Inc., *510 Clyde Ave., Mountain View, California* 94043 (DA0G9031; DAAG29-79-C-0020)

To obtain, experimentally, systematic wing-alone data base measurements which are as free as possible of support interference effects and which extend to higher aspect ratios. Relevance - the research is directly relevant to the prediction of aerodynamics and hence performance of tactical air defense missiles.

A variety of pressure and force wing models with varied aspect ratio, taper and airfoil sections will be tested for subsonic and low supersonic speeds in the Ames 6-by-6 foot supersonic wind tunnel and for moderate to high supersonic speeds in the Langley unitary 4-by-4 foot wind tunnel.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0007, SURVEILLANCE - EFFICIENT EXCIMER DISCHARGE LASER
D.E. Rothe, Northrop Corp., Research & Technology Center, *1 Research Park, Palos Verdes Peninsula, California* 90274 (DN875654; N00014-78-C-0831)

The objective of this work unit is to contribute to the development of a satellite-mounted blue-green laser that is suitable for Navy communication and surveillance applications.

To accomplish the proposed objective, an experimental and theoretical program will be pursued to optimize power coupling into the rapidly changing load characteristics typically encountered with high-pressure self-sustained gas discharges. A novel high-pressure gas laser device that employs high-voltage transverse electrical preionization and high-impedance longitudinal electrical excitation will be designed, built, and characterized using KrF, XeCl, and N2 gas mixtures. A computer model will be developed that is capable of describing the time-dependent electrical and power coupling characteristics of both this device and a contractor-owned uv preionized transverse excited device. Model predictions will be compared with experimental results and optimum drive circuits for both laser devices and will be designed, fabricated, and tested.

4.0008, MILLIMETER WAVE COMMUNICATIONS TECHNOLOGY
W.H. Watson, U.S. Dept. of Defense, Navy, Naval Ocean Systems Center, Electronics Engineering & Sciences Dept., *San Diego, California* 92152 (DN988682)

Develop millimeter wave components for a Q-band transmitter chain in support of satellite communication systems.

Develop components for the transmitter system to include an S- to Q-band power-up converter, a 10 watt solid-state amplifier and a 250 watt traveling wave tube (TWT) amplifier. Supporting contractual work reported under DN987685.

SUPPORTED BY U.S. Dept. of Defense, Naval Electronic Systems Command, Electronic Technology Div.

4.0009, SOLAR FLARE PREDICTION (PART OF BLOCK PROGRAM FOR EM/EO)

J.H. Richter, U.S. Dept. of Defense, Navy, Naval Ocean Systems Center, Environmental Sciences Dept., *San Diego, California* 92152 (DN888505)

Determination of solar flare precursor and development of forewarning criteria for the purpose of improved naval communication by minimizing the effects of communications blackouts and disturbances caused by solar flares.

High-resolution solar radiation temperature contour maps will be analyzed by examining the temporal and spatial characteristics of active regions at 3.3mm, 8.6mm, 2.0cm, 3.2cm and 9.1cm wavelengths. By comparing active-region parameters obtained from the analysis, a description will be developed to be used in solar flare modeling and to determine solar flare precursor criteria. Correlations to solar emissions at other wavelengths will be made.

SUPPORTED BY U.S. Dept. of Defense, Naval Material Command, Support Technology Div.

4.0010, SAW READOUT

J.P. Rahn, U.S. Dept. of Defense, Navy, Naval Weapons Center, *China Lake, California* 93555 (DN782271)

To carry out a program which will lead to the development of an infrared imaging system that is readout by means of surface acoustic waves. Such a system could operate in either the 3-5 micron or 8-14 micron bands and would have many desirable features that are nonexistent in present systems, e.g., low cost, compact, rugged, no moving parts and room temperature performance may be possible.

The electric field of a surface acoustic wave propagating on a piezoelectric material (such as lithium niobate) penetrates into an adjacent semiconductor and experiences attenuation and phase shift due to the presence of free charge carriers in the latter. This effect will be utilized to sense spatial variations in infrared intensity on either a narrow band-gap semiconductor or a pyroelectric material. Measurements will be made that will result in a definitive statement of the applicability of surface acoustic wave scanning of infrared imagery to the needs of the Navy. It is anticipated that industry involvement in this program will begin during FY78.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

4.0011, LASER-PLASMA INTERACTIONS

F.F. Chen, University of California, Los Angeles Campus, School of Engineering & Applied Science, Dept. of Electrical Sci & Engin, *405 Hilgard Ave., Los Angeles, California* 90024 (EY-76-S-03-0034 PA #236)

In inertial confinement fusion, an important problem is the coupling of driver energy to the target pellet in the region of the corona plasma that is produced on the surface of the target. The object of this program is to study the interaction of CO2 laser light and high-power microwaves with independently produced plasmas, so as to verify theoretical predictions on the various non-linear processes that can occur. Among these phenomena are parametric reflection via stimulated Brillouin and Raman scattering; nonlinear refraction and filamentation; nonclassical absorption via parametric decay, oscillating two-stream, and two-plasmon decay instabilities; resonance absorption; generation of fast ions and electrons and of spontaneous magnetic fields; and reduced heat transport. The first phenomena on this list are currently under investigation.

RESULTS: In the CO2 program, the first detection of stimulated Brillouin scattering in a thermal plasma was achieved. The apparatus has been upgraded to give higher intensity, shorter pulses, and a more reproducible plasma target. In the microwave program, the effect of finite pump bandwidth has been investigated on the parametric decay threshold, fast electron generation, density profile modification, and spontaneous magnetic fields.

SUPPORTED BY U.S. Dept. of Energy, Div. of Laser Fusion

4.0012, A GALERKIN-FINITE ELEMENT TECHNIQUE FOR SMALL-SCALE ATMOSPHERIC FLOWS AND TRANSPORT OVER GENERAL TERRAIN 15810-GS

R.L. Sani, University of Colorado, Boulder Campus, School of Engineering & Applied Science, Dept. of Aerospace Engineering Sciences, *1200 University Ave., Boulder, Colorado* 80302 (DA0G8967; DAAG29-79-G-0045)

To develop and assess a primitive, variable, Galerkin-finite element (GFE) technique which can accomodate general topography and which leads to a discretized system involving only velocity model unknowns. Relevance - many battlefield problems involve understanding of air flows in complex terrain. This is basic research which has long-range relevance to better modeling of air flows based on observations at a few sites.

The approach involves exploring theoretically and numerically the possiblities that GFE techniques are appropriate for application to small-scale flows where irregular terrain is a problem.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0013, REUSABILITY OF FILAMENT-WOUND LAUNCH TUBES

C.M. Minke, Hercules Inc., *910 Market St., Wilmington, Delaware* 19806 (DA0G1081; DAAK40 78 C 0101)

Find cost-effective techniques and methods of reducing to acceptable limits the ablation of the bore of fiber-reinforced composite launch tubes by the exhaust from rockets using aluminized propellant.

The task involves: A. Assessing the interior environment of the launch tube. Three diameter ranges are being considered - 2.5-6.0 inches, 6-10 inches, and 10-16 inches. B. Selecting possible composite candidates that will withstand the environments. C. Qualitatively assessing the suitability using primarily a blown flame source.

SUPPORTED BY U.S. Dept. of Defense, Missile Research & Development Command, Ground Equipment & Missile Structures Directorate

4.0014, ELECTRONIC DEVICES & CIRCUITS FOR USE IN RADIATION ENVIRONMENTS

H.L. Hughes, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN020143)

The objective is to improve the reliability of transistors, integrated circuits, and other semiconductor devices required to operate in nuclear radiation environments (nuclear-weapon and space environments). Such circuits and devices are required in naval missile, satellite, and ship systems (e.g., Trident, GPS, DMSP, MEECN, MX).

The approach is to develop a complete family of radiation-hardened CMOS/SOS bulk silicon and NMOS LSI circuits. The most radiation-susceptible region of CMOS devices is the insulator-semiconductor interface. Techniques to reduce the radiation sensitivity of this interface are being pursued. Silicon dioxide films with highly controlled electrical properties are being grown and deposited on silicon device substrates. The reduction of radiation-induced surface effects in bipolar devices and circuits is also being investigated. LSI/VLSI fabrication techniques such as E-beam and X-ray lithography are being investigated in terms of hardness.

SUPPORTED BY U.S. Dept. of Defense, Defense Nuclear Agency

4.0015, TRAINING EFFECTIVENESS EVALUATION IN FLIGHT TRAINING

J.A. Puig, U.S. Dept. of Defense, Navy, Naval Training Equipment Center, Human Factors Lab., *Orlando, Florida* 32813 (DN994029)

The objective of this task is to develop a training effectiveness evaluation technology that can be applied to current and future training programs. This effort will prove useful in estab-

lishing guidelines for evaluating training programs and their training devices.

This effort will involve the following tasks: (a) develop a training effectiveness evaluation (TEE) technology with the intent of refining techniques to provide more efficient and sensitive instruments for evaluation, (b) develop guidelines and publish a 'handbook' or guide to training evaluation, (c) apply and validate the methods described in the guide, and (d) develop a TEE specification and data item descriptions (DIDs).

SUPPORTED BY U.S. Dept. of Defense, Naval Training Equipment Center, Human Factors Lab.

4.0016, DYNAMICS OF COMPOSITE MATERIALS AND ELASTIC STRUCTURAL ELEMENTS WITH VARIABLE DIMENSIONS 15872-E

S. Nemat Nasser, Northwestern University, Evanston Campus, Technological Inst., Dept. of Civil Engineering, *633 Clark St., Evanston, Illinois* 60201 (DA0F9277; DAAG29-78-G-0149)

The development and exploitation of a new methodology for an effective and accurate response of elastic composites and the vibration of elastic structural components which have relatively large variations in their stiffness, mass distribution and/or dimensions. Relevance - the dynamic response of optimized lighter weight missile and aircraft structures constructed of composite materials requires critical analysis. The use of composites with meaningful dynamic analysis will result in improved helicopter components.

Appropriate mixed variational principles will be used in connection with either a Ritz-type approximation (for composites and structures with regular geometries) or with a finite element approach (for irregular geometries).

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0017, DYNAMIC RESPONSE OF ROTOR/BEARING SYSTEMS

C. Cusano, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Mechanical & Industrial Engineering, *207 Engineering Hall, Urbana, Illinois* 61801

The purpose of this analytical investigation is to study the dynamics of rotors supported in fluid-film bearings. The areas which are being investigated include: (a) The transmissibility and stability of gas-lubricated, externally pressurized porous journal bearings supporting a rigid rotor. (b) The transmissibility characteristics of flexibly-mounted rolling-element bearings and fluid-film bearings in porous bearing squeeze-film dampers. Results obtained from relatively simple rotor-bearing models have demonstrated that porous bearings, under certain operating conditions, can be more effective dampers than solid bearings operating under the same conditions.

SUPPORTED BY University of Illinois

4.0018, A GRAPHICAL INTERPRETATION OF VARIABLES IN LAMBERT'S PROBLEM

J.E. Prussing, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Aeronautical & Astronautical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801

In orbital mechanics Lambert's problem is the classical boundary value problem of determining the two-body orbit which connects two given position vectors in a specified flight time. It is used in modern-day spacecraft targeting problems. In the classical formulation for the time-of-flight equation, due to Lagrange, two variables appear which are functions of the geometry of the terminal radii and the energy of the transfer orbit. A simple geometrical interpretation of these variables as angles has been obtained. Applications of this interpretation to the solutions of the boundary value problem are being investigated.

4.0022, NAVY VEHICLE DESIGN AND CONSTRUCTION - DESIGN TECHNIQUES FOR MULTIVARIABLE DIGITAL CONTROL SYSTEMS WITH MULTIPLE SAMPLE RATES

S.W. Gully, Analytic Sciences Corp., *6 Jacob Way, Reading, Massachusetts* 01867 (DN975440; N00014-79-C-0431)

During the design of a digital flight control system, it can be advantageous to have different feedback loops sampled at separate rates in order to save on computer requirements. For example, the response characteristics of an inner stability loop and an outer guidance loop are usually an order of magnitude apart and, therefore, the sample rates of each loop can also differ by the same amount. No modern control theoretical technique exists for designing multivariable digital control systems with multiple sample rates. The purpose of this project is to develop practical synthesis and analysis methods for multirate digital control systems.

The optimal multirate control problem will be formulated by starting with the optimal multirate estimation procedure which has been developed by the contractor. The general optimal multirate estimation and control problem will then be solved. The algorithms which are developed will be exercised on a realistic aircraft with multirate sensors and actuators. Optimal multirate control law and state estimation will be constructed and compared with single rate designs to illustrate the advantages and differences in complexity between them. An algorithm which will automatically guarantee a stabilizing initial starting property will be developed.

4.0023, ENERGY CONVERSION COMPRESSOR BLADE FLUTTER MEASUREMENT USING RETROREFLECTORS

J.L. Kerrebrock, Massachusetts Inst. of Technology, School of Engineering, Dept. of Aeronautics & Astronautics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DN875763; N00014-78-C-0536)

The objective of this project is to assess the viability of compressor blade flutter measurements utilizing a retroreflector technique developed at Aerodyne Research, Inc. The effort is experimental in nature and is aimed at direct measurements of aerodynamic damping coefficients in terms of interblade phase

angle, tip Mach number, and pressure ratio. This research will contribute to an increased understanding of the effects on performance of one of the limiting factors in the design of fan and compressor blades (blade flutter), and hopefully result in increased performance of gas turbine engines needed for naval aircraft propulsion, but useful as well to marine power plants and fixed installations.

An instrument designed, built, and calibrated by Aerodyne Research, Inc., has been procured by the M.I.T. gas turbine laboratory. It will be utilized in an M.I.T. blowdown compressor to conduct blade flutter measurements for correlation with conventional on-going flutter research. Capability of the sensor will be extended to include two channels and to detection of the direction as well as the amplitude of the motion.

4.0025, CURVATURE EFFECTS ON EFFECTIVENESS AND HEAT TRANSFER IN THREE-DIMENSIONAL FILM COOLINGS 16595-E

E.R. Eckert, University of Minnesota, St. Paul Campus, Graduate School, *St. Paul, Minnesota* 55101 (DA0G9098; DAAG29-79-C-0117)

To conduct an experimental and analytical fundamental study to determine the influence of curvature for the design of film cooling arrangement of turbine blades. The curvature of the turbine blades will affect the heat transfer coefficient and will be used to predict the blade temperatures and, consequently, the ensuing blade thermal stresses. Relevance - this work is applicable to Army helicopter engines where the current trend is to higher temperature, highly cooled gas turbines.

The heat transfer of flow around a circular cylinder, with coolant injection through a row of holes, will be measured in a low-speed wind tunnel. The pressure variation along the cylinder surface, as well as the boundary layer development without and with film cooling, will be obtained. The mass transfer analogy will be used to determine the film cooling effectiveness. Foreign gas will be ejected through the holes and the condensation of this gas along the cylinder surface downstream of the holes will be measured using a gas chromatograph. A second cylinder covered by a thin layer of naphthalene will likewise be tested.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0026, INCOMPRESSIBLE AXISYMMETRIC WAKES

F.R. Hama, Princeton University, School of Engineering & Applied Sciences, Dept. of Mechanical & Aerospace Engineering, *Box 430, Princeton, New Jersey* 08540 (ENG78-24177)

This is a continuation of research previously supported under NSF Grant ENG 77-28247 dealing with the instability, vortex formation or shedding, and transition behind an axisymmetric body. The central focus is on the mechanisms within nonlinear stability theory leading to transition to turbulence in axisymmetric flows. During earlier grant periods an elaborate suspension system was constructed to accommodate the necessary critical alignment of the test model. A misalignment of one minute of angle could result in asymmetry of the mean velocity distribution which in turn promotes flow instability. Experiments conducted show features not found in other experiments such as appearance of higher harmonics in the spectra and appears to be associated with a two-dimensional-like travelling wave instead of the helical mode assumed in the current theory. This grant will provide support to complete the stability experiments.

4.0028, DAMAGE REPAIR PROCEDURE

F. Drum, Grumman Aerospace Corp., *S. Oyster Bay Rd., Bethpage, New York* 11714 (DN890156; N00019-79-C-0106)

To obtain a repair methodology that is cost-effective, compatible with the material requirements of the full-size hardware and permits the rapid restoration of the damaged stabilizers to original levels of structural integrity and environmental durability.

The repair approach will be the application of an adhesive-bonded boron/epoxy patch co-cured in an autoclave. The repair site will be stepped to accommodate the flush portion of the patch. The external doubler portion of the repair will be covered with a ply of fiberglass/epoxy.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Air Systems Command

4.0029, RAYS AND MODES ON CONCAVE SURFACES 15972-EL

L.B. Felsen, Polytechnic Inst. of New York, Brooklyn Campus, Graduate School, Dept. of Electrical Engineering & Electrophysics, *333 Jay St., Brooklyn, New York* 11201 (DA0G8978; DAAG29-79-C-0005)

To provide fundamental understanding of electromagnetic wave propagation on and scatter by concave surfaces and surfaces with variable curvature including effects on polarization. Relevance -results of this study will be directly relevant to ground wave propagation over uneven terrain, scatter from concave surfaces such as jet engine intake cavities, large reflector antennas and dome phase array antennas.

To proceed by studying selected cononical problems which can be solved exactly and thus provide rigorously based asymptotic results. The solutions will be cast in terms of a mixture of ray-optical and whispering gallery modes chosen in correct proportion to obtain accurate results.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0030, NAVIER-STOKES NUMERICAL STUDIES OF THE SUPERSONIC LAMINAR FLOW ABOUT CONES AT ANGLES OF ATTACK

Unknown, Polytechnic Inst. of New York, Long Island Center, School of Engineering, Dept. of Mechanical & Aerospace Engineering, *Farmingdale, New York* 11735 (DN875484; N00014-78-C-0597)

The development of accurate methods to compute the flow fields about bodies for complex flow situations is essential for the aerodynamic design and optimization of aircraft and missiles. In the proposed investigation, the laminar flow over a yawed cone will be studied within the the framework of the Navier-Stokes equations. Particular attention will be devoted to the formation of vortices near the leeward symmetry plane; the formation of cross-flow imbedded shocks; and the strong viscous-inviscid interactions for both the axial and the secondary flows.

A new solution procedure, for the Navier-Stokes equations in primitive variables, which utilizes the fact that the flow has a dominant (axially) direction will be used. The difference equations will employ a filtering technique, which in model problems has drastically reduced oscillations associated with cap-

tured shocks. The filtering procedure is equivalent to a weighted-average of conservation and non-conservation differencing.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

4.0031, RESEARCH ON MICROWAVE JUNCTION-GATE FIELD EFFECT TRANSISTORS 13586-EL
S.K. Ghandhi, Rensselaer Polytechnic Inst., School of Engineering, Dept. of Electrical Engin, *110 8th St., Troy, New York* 12181 (DA0E9120; DAAG29 76 G0172)

To investigate and improve junction field effect transistors in III-V compounds. Relevance - electronic III-V compound devices permit operation into tens of gigahertz; junction gate field effect transistors are expected to be more reliable than presently used Schottky gate field effect transistors. Vital relevance to communication/navigation satellites, tactical communication links, missile guidance, ew equipment.

To study basic problems associated with the growth and characterization of the channel layer, and with obtaining an improved understanding of diffusion and masking problems associated with the junction gate.

SUPPORTED BY U.S. Dept. of Defense, Army Materiel Development & Readiness Command, Army Research Office

4.0032, IMPROVED CONTAMINATION CONTROL OF CIRCULATING ENGINE LUBRICATING OIL
J.A. Tichy, Rensselaer Polytechnic Inst., School of Engineering, Dept. of Mechanical Engineering, *110 8th St., Troy, New York* 12181 (DN975183; N00014-79-C-0100)

The objective is to upgrade the technology for separation of contaminants from circulating lubricating oil. Recent studies of maintenance procedures in naval diesel-powered ships and aircraft engines have clearly indicated that the contamination of circulating lubricating oil is a major source of increased wear and friction, premature failure of machine elements, and high maintenance costs.

The approach will be to conduct an investigation study of new available technology which can be used to solve current ship and aircraft circulating oil problems. The study will be performed in four phases: (a) determine particulate content of used oils, correlate with measured rheological behavior. (b) develop a lubrication filtration theory. (c) conduct controlled filtration experiments to test the filtration theory. (d) perform centrifugal filtration studies and wear tests.

4.0036, PICOSECOND OPTICS
M.F. Becker, University of Texas, Austin Campus, School of Engineering, Dept. of Electrical Engineering, *200 W. 21st, Austin, Texas* 78712

DESCRIPTION: This research program is aimed at measuring fast optical phenomena on a previously unavailable time scale. We have constructed an optical delay line apparatus which can resolve fast phenomena on the 10 picosecond to 10 nanosecond time scale using mode-locked laser pulses. As a candidate for our first experiments, we have chosen the semiconducting-metallic phase transition in vanadium dioxide (VO2) at 68 degrees C. As this material is of interest as a potential optical data storage medium, the writing time and energy requirements as well as the mechanisms of the transition are of interest. Measurements of the dynamic behavior of this transition have been made by initiating the transition with a short, energetic light pulse and probing its state at some later time with a portion of the same pulse which has been optically delayed. As the delay time is changed and the transition reexcited, its response can be traced for all times of interest. Preliminary experiments show exceedingly fast (less than 10 psec.) optical excitation of a nonequilibrium state followed by an exceptionally long decay period. From this time-resolved reflection and transmission data, we can attempt to understand the dynamic behavior of the phase transition. The project is in its fourth year and expected to continue fairly indefinitely.

4.0040, NUMERICAL SOLUTIONS OF THE TIME-DEPENDENT COMPRESSIBLE NAVIER-STOKES EQUATIONS
S. Abarbanel, Tel Aviv University, *155 Herzl St., Tel Aviv, Israel* (DF052850; AFOSR-78-3651)

AF function - aerospace vehicles. Opportunity - the design of future Air Force weapons systems will require fast and accurate solutions to complex compressible flow problems in such areas as aircraft-external weapons carriage effects, reentry flow dynamics, and flight at high angle of attack. Theoretical methods now available for analyzing such flow fields are either inadequate or excessively costly for engineering applications. Objective - to develop a variety of numerical-mathematical tools for solving the partial differential systems governing compressible (inviscid and viscous) flow and to apply them to problems of

interest in aerodynamics. How work contributes - the research effort will develop numerical methods suitable for analysis of inviscid and viscous compressible flow fields, including the presence of shock waves. Effort will be directed toward increasing the accuracy, reducing computational time, and increasing the generality of application of the methods developed relative to those currently available.

A finite difference method developed previously for solving inviscid, compressible flow problems will be extended to calculate the viscous flow field for slender, blunted bodies at angle of attack. Also, a study of the stability of initial boundary value problems for the case of dissipative finite difference schemes suitable for application to aerodynamics problems and a study of the effect of boundary treatment on the stability of the overall scheme will be made. In addition, spectral methods based on Chebyshev polynomials will be used to investigate the problem of the interaction of a shock wave with a boundary layer.

5.0001, GLACIOLOGY STUDIES

L.R. Mayo, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *213 E St., Anchorage, Alaska* 99501 (AK 66-049)

1. Determine the relationship between climate and snow and ice storage, runoff and ice motion in glacierized basins in Alaska. 2. Answer specific questions concerning glacier activity, potentials and hazards as construction projects and populations encounter glacier-affected streams, lakes and basin areas.

Collect long term, high quality climatic, snow balance, ice balance, ice motion and streamflow measurements and analyze these data to detect significant changes as they occur. Advise of specific hazards and benefits due to the presence of glacier activities as they arise. Maintain an up-to-date aerial photographic library from which interpretations can be made.

Key instrumentation at two glacier basins studied during the International Hydrological Decade, 1965-1974, will be maintained. These two Index Glacier Basins serve as the bases for analysis of snow cover and glacier activity monitored by aerial photographic reconnaissance throughout Alaska. Field trips to basins with specific questions are used to further refine the reconnaissance interpretation. Collect data on the regime of a glacier-dammed lake to analyze its complete cycle.

Fully integrated methods for field surveying of glacier dynamics and field/office calculating of all major results completed. These new techniques allow field verification that all items of glacier dynamics are measured adequately. Ice radar capability achieved. Dynamic response of even large glaciers to climatic changes is much more rapid than previously suspected.

Fully develop and field test a method for obtaining annual maximum and minimum balance in glaciers of any size with only one field trip a year of only a few days. This will allow development of program to monitor climatic variations of very large glaciers.

5.0002, DEVELOPMENT OF MARTIAN TERRACED-EJECTA DEPOSITS

M. Sheridan, Arizona State University, School of Liberal Arts, Dept. of Geology, *Tempe, Arizona* 85281 (NSG 7642)

SUPPORTED BY U.S. National Aeronautics & Space Admin., Office of Space Science

5.0003, VOYAGER

L.A. Soderblom, U.S. Dept. of the Interior, Geological Survey, Astrogeologic Studies Branch, *601 E. Cedar Ave., Flagstaff, Arizona* 86001 (9580-01031)

On March 5, 1979, the Voyager 1 spacecraft will fly past Jupiter and its array of satellites, making close approaches to three of the satellites. Io, Ganymede, and Callisto will be imaged over a wide range of phase angles in both color and black and white at resolutions between one and three kilometers. Additionally, the satellites Europa and Amalphea will be imaged at FAR encounter at a resolution of about ten kilometers. The Galilean satellites are large planetary bodies, two of them are larger than our Moon and two of them are larger than the planet Mercury. The imaging data will be used for visual interpretation of the surface histories as well as to prepare color or spectral albedo maps to characterize the distribution materials on their surfaces. On July 9, 1979, Voyager 2 will make a similar pass through the Jovian system, again passing close to three of the satellites. The hemispheres of Callisto and Ganymede, which were not imaged on Voyager 1, will be imaged on Voyager 2, providing coverage of approximately 80% of those bodies at resolutions between 1 and 3 kilometers. Additionally, Europa, slightly larger than our Moon, will be imaged at a resolution of about 5 kilometers. The Jovian system is exciting from the point of view of planetary research because the satellites which revolve about Jupiter in regular circular orbits mimick the planets around the sun. The satellites exhibit regular trends such as decreasing density and increasing mass in volume with increasing distance from Jupiter. Because they have suffered identical bombardment histories, it should be possible to compare the evolutionary histories of a collection of bodies, which range from rocky satellites to large ice balls.

5.0004, PIONEER VENUS RADAR

H. Masursky, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-01535)

The Pioneer Venus orbiter spacecraft was launched successfully in May and will be inserted into Venus orbit December 4, 1978. Low resolution radar images and altimetry data will be acquired of the entire planet between 75 degrees N and 50 degrees S latitudes along subspacecraft tracks spaced 150 km apart at the equator. During the extended mission the ground tracks obtain coverage at a spacing of 75km at the equator. The coarse radar images and altimetry traces combined with high and low resolution Earth-based telescopic images will allow the construction of mosaics and topographic maps. These maps, combined with gravity and magnetic data obtained by the orbiting spacecraft, will increase our knowledge of the surface expression of geologic features which will provide clues to possible volcanic, tectonic and eolian processes that have operated on the planet, and eventually to a deeper understanding of Earth, the twin planet, as well as Venus.

5.0005, EOLIAN PROCESSES

J.F. McCauley, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *2255 N. Gemini Dr., Flagstaff, Arizona* 86001 (9580-02353)

STATES TO WHICH PROJECT PERTAINS: Arizona, New Mexico.

Plans include wind tunnel experiments, field observations and electron microscopy studies to determine the response of rocks of various lithologies to wind erosion, and to define the relative role of deflation as opposed to abrasion in the evolution of planetary surfaces. Systematic measurements of wind and other climatic data in various types of desert regions will be obtained in connection with another project, by emplacement of remote sensing platforms that transmit to the GOES-1 satellite, for relay to the USGS Computer Center at Flagstaff. Geologic field studies will be conducted to provide ground data on topography, vegetation, surface sediments and rock types in each area. Analysis of the data is expected to result in mathematical models of eolian processes for application to the interpretation of data from planetary missions such as Viking and Voyager.

5.0006, NAVY ENVIRONMENT - FOG ANALYSIS
H. Loos, Laguna Research Lab., *21421 Stans Ln., Laguna Beach, California* 92651 (DN675223; N00014-76-C-0436)

The objective of this research is to analyse and select from the electrical mechanisms operative in the coalescence of fog drops that one which is theoretically optimum as the basis for field trials of fog modification experiments. Better environmental support of naval operations constitutes the relevance of this research.

Details of the analysis will include size of charged drops in relation to fall speed and dwell time in the fog, extent of charge, relative numbers of seed drops in relation to fog density, means of production of charged drops, avoidance of corona and discharge limits for amount of charge placed in cloud, etc.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

5.0007, CLOUD COVER MEASUREMENT SYSTEM
T.W. Metcalf, U.S. Dept. of Defense, Navy, Naval Ocean Systems Center, Surface & Aerospace Surveillance Dept., *San Diego, California* 92152 (DN987533)

(1) To determine the relative opacity of clouds in the visible and ir spectrum. (2) To determine the percentage of time if a difference in opacity in the visible and ir spectrum exists. This information is essential in order to select an optimum EO sensor to be used on an earth surveillance satellite.

The relative opacity of clouds will be determined by comparing the energy in the visible and ir spectra radiated from the sun through the clouds. The visible radiation from the sun will be detected by a TV camera and the ir radiation by a pyroelectric Vidicon camera. The sensors will be mounted on an equatorial clock-driven mount that tracks the sun as it moves across the sky. The output of the two sensors will be monitored and analyzed by a video processor unit designed around a microcomputer. If either of the two video signals meet a predetermined criteria, the microcomputer will turn a video recorder on. The images from both sensors will be recorded for a more detailed analysis.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Material Command

5.0008, LABORATORY EXPERIMENTS ON THE ELECTRON ACCELERATION UNDER CONDITIONS SIMILAR TO THE AURORAL MAGNETOSPHERE
H. Boehmer, University of California, Irvine Campus, School of Physical Sciences, Dept. of Physics, *Irvine, California* 92664 (ATM79-15159)

This grant will support a laboratory experiment that should shed light on the phenomena leading to electron acceleration in the polar magnetosphere above auroral arcs. The experimental conditions will be chosen to simulate the plasma state found by the S3-3 satellite to exist in the magnetosphere: a fully ionized, magnetized and collisionless plasma with a magnetic field-aligned electron drift in a current channel whose radial extent is of the order of the hot ion Larmor radius. In this plasma, which contains strong electrostatic ion cyclotron wave turbulence, phenomena have been observed that are interpreted as the generation of suprathermal electrons. By measuring the temporally and spatially resolved electron energy distribution and plasma potential, the mechanism of the electron acceleration will be investigated and compared with various models like anomalous resistivity, trapping and electrostatic shocks or double layers.

5.0009, SEARCH AT SOUTH POLE FOR THE PENDULUM MODE OF THE EARTH'S INNER CORE
L.S. Knopoff, University of California, Los Angeles Campus, Inst. of Geophysics & Planetary Physics, *405 Hilgard Ave., Los Angeles, California* 90024 (DPP77-27903 A01)

The University of California at Los Angeles will continue to observe changes in the gravity at the South Pole in order to derive earth tides and earth's free vibrations. This research has been underway since 1967, most recently under grants DPP76-17234 and DPP77-27903, using two Lecoste-Romberg earth-tide gravimeters to measure vertical gravitational changes. The project will make modifications to the instruments and use a newly developed pendulum gravimeter in order to improve the sensitivity of the observations by a factor of approximately 100. The increased sensitivity will be used to search for the earth's inner-core pendulum mode. The data from the South Pole are unique because of the geographical relationship to the solar and lunar gravitational forces and because of the extreme stability and seismic quietness of the polar ice cap. The project is yielding significant data and conclusions on the inner structure and composition of the earth. During the winter of 1980, two relatively automatic, matched gravimeters will be operated by UCLA at South Pole.

One UCLA scientist is at South Pole during 1979. Another UCLA scientist will be at the South Pole during 1980. An additional UCLA scientist will be at the South Pole during the 1979-80 summer to assist in the installation and adjustment of the equipment. One additional UCLA scientist will be in training under this grant at UCLA during 1980 for possible duty at the South Pole during 1981.

5.0010, SEASAT PROGRAM - AN OCEAN MESOSCALE EDDY INVESTIGATION UTILIZING SEASAT-A SMMR DATA
R.L. Bernstein, University of California, San Diego Campus, Scripps Institution of Oceanography, *P.O. Box 1529, La Jolla, California* 92038 (K7-972; MO-A01-78-00-4329)

OBJECTIVE: To create from SMMR data, oceanographically useful sea surface temperature maps with an effective grid resolution between 50 and 100 km spatially, and five days temporally. These maps will be used to study the development of strong mesoscale (200 - 600 km) meanders and eddies in the Kuroshio - Oyashio extension region (30 degrees - 45 degrees N, 140 degrees - 170 degrees W), which have detectable sea surface temperature expressions in all seasons except summer.

APPROACH: Sea surface temperature data obtained by the SEASAT-A SMMR will be assembled for the western North Pacific, and mapped in five-day blocks. The maps will be examined for internal consistency and compared with conventional XBT data obtained by ships-of-opportunity, to establish a confidence level.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Environmental Satellite Service

5.0011, NAVY ENVIRONMENT - MERGING SATELLITE AND CONVENTIONAL OCEANOGRAPHIC DATA
R.L. Bernstein, University of California, San Diego Campus, Scripps Institution of Oceanography, *P.O. Box 1529, La Jolla, California* 92038 (DN975254; N00014-75-C-0152)

A series of academic and tactical studies are to take place in the Pacific Ocean in waters contiguous to the west coast of the United States. A number of these investigations will be directly or indirectly in support of Pacific Fleet activities. Those activities, particularly ASW operations, need current and forecast knowledge of surface and subsurface thermal conditions, ocean waves, surface winds, and other ocean features over broad ocean areas of their operations. These mesoscale areas can be scanned in real-time with subsequent detailed interpretation of DMSP and NOAA satellite imagery. Near simultaneous measurements of physical oceanographic parameters are essential in the validation of ground-truth interpretations of the imagery.

Remotely sensed sea surface data from satellites and aircraft will be analyzed in conjunction with in-situ ocean thermal information. These field experiments will support the basis of design criteria for satellite input to oceanographic research and subsequent fleet ocean forecasts.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

5.0012, TROPOSPHERIC MEASUREMENTS OF PARTICULATES AND TRACE GASES

B.J. Huebert, Colorado College, Graduate School, *Colorado Springs, Colorado* 80903 (ATM79-06146)

Project GAMETAG (Global Atmospheric Measurement Experiments on Tropospheric Aerosols and Gases) provided significant, new data on tropospheric HNO3 and HCl vapors and particulate NO3-, Cl-, SO4--, and NH3 ion. Although important information has been obtained about global budgets for trace species, gas/particle interactions, and the photochemistry of the troposphere, large gaps remain in our knowledge. This grant funds the development and demonstration of high volume sampling techniques for use in very clean areas of the troposphere which will (1) provide size versus chemical composition information on aerosols, (2) make more specific collections of HCl and HNO3, in the presence of other acidic chlorides and nitrates, (3) collect NH3 vapor, (4) permit several metal analyses to be performed on particulates from remote areas, and (5) allow a measurement of the total aerosol acidity. These techniques will facilitate the identification of sources of trace atmospheric species and the study of reaction mechanisms not possible with present instrumentation. The techniques will be demonstrated as an auxiliary experiment on aircraft already scheduled to be deployed during the MONEX project during the summer of 1979.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0013, RADIATIVE EFFECT OF FINITE CLOUDS IN FIELDS OF CLOUDS

T.B. McKee, Colorado State University, School of Engineering, Dept. of Atmospheric Sciences, *Fort Collins, Colorado* 80523 (ATD78-27556)

The objective of this research program is to provide an increased understanding of the interaction of solar radiation in fields of clouds. Cloud geometry has been shown to have a pronounced effect on the radiances and irradiances of individual clouds. However, clouds occur in such a wide array of microphysical properties, geometric shapes, and time scales that the effect of geometry (or in broader terms, horizontal inhomogeneities) upon the energy exchange in terms of reflection (albedo), absorption, and transmission is not obvious. Theoretical treatment of radiative transfer in clouds has been extensive for semi-infinite plane parallel clouds. This research treats clouds as finite bodies. The theoretical work on finite clouds has shown that they can be very different from a piece of semi-infinite cloud and can also be very similar depending on the physical properties, solar-viewer geometry, and optical thickness. The effects of the finiteness or geometric shape upon cloud fields in the earth's atmosphere have not been investigated in detail. This project will compare finite cloud model computations with observed atmospheric data.

This research used cloud physics and radiation data collected during the 1974 field phase of the Global Atmospheric Research Program (GARP) Atlantic Tropical Experiment (GATE) objective of improving understanding of the interactions between radiation and tropical circulations.

This grant is a natural continuation of a previous GATE grant to Professor McKee.

5.0015, GEOLOGIC APPLICATIONS OF THERMAL-INERTIA MAPPING FROM SATELLITE-HCMM

T.W. Offield, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *Box 25046 MS939, Denver Fed. Ctr. Bldg. 25, Denver, Colorado* 80225 (9790-02189)

To evaluate the effects of scale and resolution changes from both HCMM satellite and aircraft data, to assess the need for topographic correlation at different scales and resolutions, and to develop an automatic topographic correction technique. Also to compare thermal-inertia data from aircraft and HCMM satellite with maps of geology, soil type, soil moisture, land use, energy resources, and vegetation to correlate thermal inertia with the target geologic materials.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0016, PICEANCE BASIN SPRING HYDRAULICS RESEARCH

G.J. Saulnier, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Bldg. 53 Denver Federal Ctr., Mail Stop 415 Box 25046, Lakewood, Colorado* 80225 (CO 75-060)

Aquifer dewatering resulting from oil-shale mining will reduce groundwater discharge to streams and springs. Many springs in the Piceance Basin are used as water supplies for livestock and domestic use. The source of these springs and the potential effects of aquifer dewatering on these springs need to be determined before actual mine dewatering begins.

Locate and determine the source of major springs in the Piceance Basin, determine their flow characteristics, and predict the effects of dewatering resulting from oil-shale mining on spring flow. Collect, compile, and maintain records of spring discharge and water quality so that changes resulting from development can be determined.

Infrared color aerial photography and thermal imagery will be used to inventory springs. Samples will be collected from springs for water quality analysis. The concentrations of fluoride and chloride and water temperature will provide information to help determine if the source of spring flow is from the Uinta or Green River formation. This information is essential to improve the conceptual model of the hydrologic system. Discharge records will be collected from flumes installed at about 70 springs to provide pre-development data on springflow.

Infrared color aerial photography and thermal imagery were used to identify springs in the Piceance Basin. Flumes have been installed and discharge records are being collected at 70 springs by grant to the Colorado Department of Natural Resources, Division of Water Resources. Water-quality samples collected by the grantee from 48 springs were analyzed by the U.S. Geological Survey. Spring schedules and geologic data were compiled for 70 springs.

Analyze the discharge, water chemistry, and geologic data to determine the geologic source of selected springs. Prepare a report on the data collected and plan for continued collection of discharge and water-quality data which will provide a basis for evaluating the effects of proposed oil-shale development on springs.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Water Resources Div.

5.0017, ASSESSMENT OF HIGHWAY ENVIRONMENTAL IMPACT IN CONNECTICUT USING REMOTE SENSING PROCEDURES

W.C. Kennard, University of Connecticut, Storrs Campus, School of Engineering, Dept. of Civil Engineering, *Box U-37, Storrs, Connecticut* 06268 (192595 (HRB NO.))

Objectives are to: 1) evaluate the potential impacts on freshwater inland wetlands caused by proposed CT 275 in the Mansfield-Coventry area, using remote sensing techniques and field studies, previously tested, evaluated, and refined; 2) contrast the results of biological field studies conducted along pro-

posed CT 195 in the winter with those conducted in the summer to evaluate relative accuracy and efficiency; 3) identify and outline those surface phenomena detectable by remote sensing techniques that might play a role in an environmental impact prediction strategy; and 4) conduct a cost-effectiveness analysis contrasting the use of color infrared and panchromatic black-and-white aerial photographs in highway corridor planning. Recent low-level CIR aerial photographs were interpreted for inland wetland delineation and classification in the corridor study area. These photographs are currently being analyzed to determine land use/cover type in the study area. Repeated wetland field studies have been conducted and these data are being analyzed statistically. Cost data for the alternate modes of aerial imagery are being collected. At the same time, measures of effectiveness are being defined and quantified.

5.0020, ATMOSPHERIC POLLUTION SCAVENGING

R.G. Semonin, State Water Survey, *Box 232, Urbana, Illinois* 61801 (6440; EY-76-S-02-1199)

The objectives of this project are to determine the time and space variability of precipitation quality and deposition over a microscale region and to operate one of the eight MAP3S precipitation chemistry network sites. A network encompassing 150 square-km with event samples spaced 1 mile apart was established in central Illinois. Event and subevent precipitation and aerosol sampling for major ions and pH are being conducted. Precipitation chemistry and aerosol composition data will be interpreted to improve the parameterization of precipitation scavenging in MAP3S regional transport models and to better quantify the roles of in-cloud and below-cloud scavenging processes.

5.0022, INTERPRETATION OF METEOROLOGICAL SATELLITE DATA

T. Fujita, University of Chicago, School of Physical Sciences, Dept. of Geophysical Sciences, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (8-011; 04-4-158-1 MOD. #9)

OBJECTIVES: To use satellite data in conjunction with other meteorological data for the purpose of learning and understanding the behavior and dynamics of mesometeorological systems, particularly thunderstorm complexes producing tornadoes and other severe weather such as heavy rains, wind, and hail. To develop means of applying satellite data to the problem of very short range forecasts, i.e., 'nowcasting'. To develop techniques and procedures for getting the satellite data into useful form for the meteorologist.

APPROACH: Emphasis in the coming 12 months will be directed toward the first and second objectives with particular attention on those severe weather systems which present special hazards to the public, such as tornadoes, high winds, and heavy rain. Fujita will continue to collect special and conventional ground truth data during and after certain tornado events for the purpose of establishing relationships between the behavior and appearance of cloud tops in satellite imagery to occurrence, intensity and persistence of tornadoes. Conduct research on the data collected during the highly successful Project NIMROD in order to relate satellite-viewed cloudtops with precipitation and windstorms beneath.

PROGRESS: Produced a 'Manual of Downburst Identification' which is intended to aid the operational meteorologist in distinguishing downburst damage from tornado damage, in identifying situations of downburst potential using radar and satellite data, and in understanding, generally, the behavior and characteristics of downbursts. From several detailed studies of SMS/GOES IR data he has observed a tendency for rapid anvil growth just prior to the downburst with a cessation of anvil growth as the downburst begins and cloud top warming near and during downburst occurrence. Fujita anticipates that once forecasters and observers distinguish between tornadoes and downbursts that tornado reports will decline markedly. Operated and directed Project NIMROD in the Chicago area and collected a wide variety of data. Many convective systems moved through the network allowing the collection of a great volume of data from RHI and Doppler radars, 315 rain gauges, special serial radiosondes, and both rapid and normal scan pictures from GOES.

5.0023, AN ATLAS OF PALEOGEOGRAPHIC MAPS

A.M. Ziegler, University of Chicago, School of Physical Sciences, Dept. of Geophysical Sciences, *5801 S. Ellis Ave., Chicago, Illinois* 60637 (EAR79-15133)

This action provides continuing support for the completion and publication of a series of paleogeographic reconstructions for thirty time intervals ranging from the late Precambrian to the Recent. The maps will show continental orientations, reconstructed biogeography, climatology, tectonic regime and the economic deposits for each time interval. The location of the continents is based on paleomagnetic measurements and checked by reference to available biogeographic data and plate tectonic considerations. The atlas is a summary and synthesis of present understanding of plate tectonics during Phanerozoic time and will provide a forum for reinterpreting the wealth of data in the geologic literature and will help focus future research.

5.0024, MICROWAVE SEA SURFACE TEMPERATURE DETERMINATION

P. Gloersen, U.S. National Aeronautics & Space Admin., Office of Space Science, Goddard Space Flight Center, *Greenbelt, Maryland* 20771 (7-141; NA79AA-G-00739)

OBJECTIVE: The objective of this research project is to obtain data sets of microwave measurements of sea surface temperature. These measurements will be made from the NASA CV-990.

APPROACH AND CURRENT PLANS: The CV-990 will be flown during satellite passage (SEASAT-1 and Nimbus-G) and over data buoys and oceanographic ships. This combination of satellite, aircraft, and surface data will enable NOAA to

make an assessment of the capability of microwave radiometers to measure sea surface temperature.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., National Environmental Satellite Service

5.0025, NUTRIENT DYNAMICS IN AMAZON LAKES

T.R. Fisher, University of Maryland, College Park Campus, Chesapeake Bay Center for Environmental & Estuarine Studies, *Box 775, Cambridge, Maryland* 21613 (DEB78-23642)

Complete descriptions of rates of supply and loss of nutrients are not generally available for tropical lakes, although dynamics of these nutrients, such as nitrogen and phosphorus, have been identified as the most important processes influencing primary production in these ecosystems. This work involves a 2-year investigation of nutrient cycling in Lake Janauaca, a tropical lake in the central Amazon Basin of Brazil. The most distinctive feature of the lake is that each year it is, to a large extent, drained and flooded by a 10-meter annual water level fluctuation of the nearby Amazon River to which the lake connects by a solitary narrow channel. Three hypotheses are being tested: (1) during the 10-meter rise in water level, the Amazon contributes 75% of the lake volume, direct rainfall contributes 8%, and 17% remains from the previous year; (2) during rising water levels, riverborne nitrate and phosphate are the most important sources of new N and P which involve several hypolimnion-epilimnion exchanges in the lake; (3) by sampling other lakes using satellite remote sensing, it will be shown that data obtained from Lake Janauaca are representative of widespread phenomena throughout the Amazon Basin that significantly influence the biological character of lakes bordering the Amazon River, as well as the geochemistry of the river itself.

5.0027, STUDY OF NATURALLY OCCURRING AND ARTIFICIALLY CREATED F-REGION IRREGULARITIES NEAR ARECIBO

S. Basu, Emmanuel College, Graduate School, Dept. of Physics, *400 the Fenway, Boston, Massachusetts* 02115 (ATM78-25264)

In recent years, the study of nighttime F-region irregularities at midlatitudes has engaged the attention of both theoreticians and experimentalists. The theoretical efforts have mostly concerned studies of plasma instabilities in the midlatitude ionosphere and computer simulations of the same. Various experimental techniques have also been used to study these irregularities.

This grant funds a program of research focusing on correlated measurements needed to identify the plasma that operate in generating small-scale irregularities in the midlatitude ionosphere. The studies are of both natural and artificial irregularities at Arecibo (where the necessary collection of diagnostic tools can be found).

Continuous measurements of Faraday rotation and amplitude fluctuations at 137 MHz with geostationary satellites will monitor total electron content for wave-like perturbations and scintillations near Arecibo. These observations will be conducted in conjunction with several periods of correlated incoherent scatter measurements of F-region density and transport. Later, when the High Frequency Ionospheric Modification Facility at Arecibo becomes operative in June, 1979, similar data will be obtained within the ionospheric volume heated by the intense modifying radio waves. The formation and decay of these artificial irregularities and, in particular, the power spectrum of irregularities in the scale length range of 0.1 - 1 km and any associated larger scale (approximately 10km) variations will provide insight into the generation of km-scale irregularities.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

5.0028, DESIGN, CONSTRUCTION AND TESTING OF LORAN-C TELEMETRY FROM A DRIFTING BUOY

R.G. Walden, Woods Hole Oceanographic Institution, Dept. of Ocean Engineering, *Main St., Woods Hole, Massachusetts* 02543 (R/E-2)

OBJECTIVES: The measurement of near-surface current transport utilizing Lagrangian techniques provides useful information for use in pollution, fisheries and oceanographic research. We propose to evaluate through experiment the feasibility of tracking a surface drifting buoy equipped with an automatic tracking Loran-C receiver and telemetry transmitter. Present methods use vessels or aircraft requiring frequent sitings. A system using satellites (Nimbus) is currently in use which provides a position accuracy of plus or minus 2 km and requires third party data processing with attendant delays. The proposed system will provide high resolution buoy position data which is immediately available to the user with a position accuracy of better than 500 m. The approach appears feasible at this time because of new developments in automatic Loran-C receivers which will automatically search and lock-on to the signals with no human participation. The receiver selected has a digital output which is compatible to directly modulate an hf transmitter.

ANTICIPATED BENEFITS: The successful development of this system will provide a Lagrangian method of tracking ocean currents within a 200 mile radius of a vessel or shore station. The system is dedicated to the user requiring no third party processing costs or delays in obtaining position information. It is not dependent upon satellite operation but upon a permanent Loran-C system which can provide accurate position fixes (greater than 500 m) any time of day.

Scientists at the Woods Hole Oceanographic Institution (Beardsley) have expressed interest in using such a system south of Bermuda, the Gulf Stream and the Gulf of Maine. The system would likewise be useful to BLM studies of George's Bank and the Georgia Embayment. The NOAA National Marine Fisheries Service PATCH study on Georges' Bank is also a potential user.

5.0029, SEASAT PROGRAM - DETECTION OF OCEANIC CURRENTS USING SEASAT-A SAR SIGNAL DATA

R.A. Schuchman, Environmental Research Inst. of Michigan, Radar & Optics Division, *P.O. Box 8618, Ann Arbor, Michigan* 48107 (7-926; MO-AO1-78-00-4322)

OBJECTIVE: Investigate techniques for detection of oceanic current motion by measurement of the SAR azimuth Doppler frequency shift by separation from wave orbital and phase velocity effects. Results will be development of algorithms for current measurements using SAR, measurement accuracy estimates, and current velocity maps for the test area.

APPROACH: Experimental sites will be chosen for maximum tidal currents in excess of 3 knots and in some cases greater than 9 knots. The corresponding difference between ebb and flood will be roughly double these values. Stationary land targets, located near the ocean test sites, will be measured to obtain a reference for the Doppler shift data. Doppler information from over-the-ocean test sites will be examined and measured for both SEASAT and aircraft cases. A correction algorithm that accounts for spacecraft yaw, pitch and roll will then be developed and applied to the SEASAT Doppler frequency scans and aircraft data. The land and sea Doppler frequency scans from SEASAT and aircraft will be examined for detection and measurement of a Doppler shift. The velocities obtained from aircraft X- and L-band wavelengths will be compared to SEASAT L-band velocity measurements. Finally, the radar cur-

rent values will be compared to sea truths surface current maps of the site areas.

5.0030, MEASUREMENTS OF DIFFERENTIAL CROSS-SECTION OF SECONDARY ELECTRONS EJECTED FROM ATMOSPHERIC GASES BY ELECTRON IMPACT

T.W. Shyn, University of Michigan, Ann Arbor Campus, School of Engineering, Dept. of Atmospheric & Oceanic Sciences, *Ann Arbor, Michigan* 48104 (ATM79-01618)

An important process in the upper atmospheres of planets is the interaction of electrons with neutral atoms and molecules. The interaction consists of elastic and inelastic scattering processes including ionization of the particles by electron impact. Electrons, particularly those produced as a result of ionization of atmospheric gases, lose their energy principally in inelastic collisions and elastic collisions, and eventually become a part of the thermal electron population at the end of the cascade energy loss process. The understanding of the energy deposition (energy lost) by energetic electrons in a particular gas or mixture of gases requires a comprehensive and consistent set of cross-sections describing the primary and subsequent (secondary) events taking place in the bombarded gas.

Reliable comprehensive experimental data on the angular and energy distributions of secondary electrons are required to understand the energy transfer processes in the upper atmosphere and to calculate the overall energy budget in the atmosphere. The long-term goal of the studies funded here is to develop complete and accurate sets of scattering cross-sections for electron impact on gases characteristic of planetary atmospheres. These cross-sections are necessary to understand the energy budget in these atmospheres. This grant funds this task for the gases N2, O2, NO, CO, CO2, H2, He, CH4, using a crossed-beam technique.

5.0031, IMPLEMENTING REMOTE SENSING CAPABILITIES IN MANAGEMENT OF WATER AND WETLAND RESOURCES

C.E. Olson, University of Michigan, Ann Arbor Campus, School of Natural Resources, *Ann Arbor, Michigan* 48104 (R/CZ-11)

OBJECTIVES: First Year: 1) Compare the U.S. Fish and Wildlife Service Wetland classification standards with the Michigan Land Cover/use Classification System to determine the degree to which the Michigan system is adaptable to the newer standards. 2. Determine and document the utility of LANDSAT data as a data source for water and wetland inventory and monitoring in Michigan, based on needs of state-level managerial personnel.

Second Year: 1. Assess the utility of LANDSAT-C thermal data in detecting upwelling and current patterns in large lakes. Use of such data in verifying existing circulation models for large lakes would be included.

ANTICIPATED BENEFITS: Two primary results are expected. First, a clear understanding of the differences between the new U.S. Fish and Wildlife Service wetland classifications and the Michigan Land Cover/use Classification System will be obtained. Second, the utility of LANDSAT data as a data source for wetland inventory in support of wetland managers will be more completely defined.

The data and experimental results, as well as the procedural steps involved in implementing a wetlands monitoring system, will be useful as input for: a) Coastal and inland wetland management programs, including the National Wetlands Inventory. b) Determinations of the impact of wetland removal by construction, agriculture or dredging activities.

IDENTIFIED BENEFITS TO DATE: Our on-going review and correlation of available information on remote sensing of water and wetland resources have shown several areas in which specific work is needed under Great Lakes conditions. Those affecting the design of a water and wetland information system responsive to the needs of water and wetland managers are considered most important. Efforts have been directed towards elucidating timely and cost-effective remote sensing methods of assessing wetland quality, shore erosion, and lake circulation patterns. A compilation of this information is in draft form, and it is anticipated that a substantial managerial community will make use of this document upon publication. We have prepared an audio-visual presentation that will be used to convey the results of the above review to decision-makers, and plan to deliver that presentation to state and local authorities starting in February.

5.0033, ANALYTICAL, EXPERIMENTAL, AND MODELLING STUDIES OF LUNAR ROCKS AND THEIR ORIGINS

L.A. Haskin, Washington University, School of Arts & Sciences, Dept. of Earth & Planetary Sciences, *4559 Scott Ave., St. Louis, Missouri* 63130 (EAR79-08762)

This is a continuation of work previously supported by NASA which has been transferred to NSF.

This work is concerned mainly with chemical aspects of evolution of lunar and planetary crusts and regoliths and trace element behavior during igneous differentiation of planetary bodies.

We will analyze mineral and lithic fragments from lunar and terrestrial rocks to help determine the trace-elements compositions of the parent rocks and their sources. We will analyze suites of terrestrial basalts as part of the LSI Basaltic Vulcanism project; these samples will be studied by a variety of techniques by other investigators. We will continue measurements of distribution coefficients and EPR and electrochemical measurements of behavior of trace elements in silicates.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Earth Sciences

5.0034, AERIAL REMOTE SENSOR DATA COLLECTION, PROCESSING, AND ANALYSIS FOR ENVIRONMENTAL MONITORING

J.R. Donaldson, Lockheed Electronics Co. Inc., *P.O. Box 15027, Las Vegas, Nevada* 89114 (68-03-2636; J833C-080)

OBJECTIVE: Provide continuing on-site, nonpersonnel services support to the remote sensing program operational and research/development at the EPA Environmental Monitoring and Support Laboratory-Las Vegas.

APPROACH: Remote sensor data acquisition, reduction and processing image analysis, and preparation of output products. Work in electronic data processing concerns technique development and the operation and maintenance of the digital image analysis system. Support is provided in the development of active type airborne monitoring systems.

PROGRESS: The contractor is presently completing the project's fifth year of support.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab.

5.0035, TROPHIC CLASSIFICATION OF LAKES UTILIZING CONTACT AND LANDSAT DATA

D.H. Boland, U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Sys-

tems Lab., Water & Land Quality Branch, *P.O. Box 15027, Las Vegas, Nevada* 89114 (J613A-023)

OBJECTIVES/APPROACH: Determine the feasibility of assessing the trophic condition of lakes using a combination of LANDSAT multispectral scanner data and contact-sensed data. Specific objectives include: 1) development and evaluation of models to predict lacustrine trophic state, 2) development and evaluation of models to estimate specific trophic indicators, 3) evaluation of LANDSAT's capability for estimating lake surface area, and 4) generation and evaluation of thematic photo maps which depict specific trophic indicators and trophic state. Water quality data were collected from ten Colorado lakes concurrently or near-concurrently with overflights of LANDSAT and NASA aircraft. Aircraft-borne instrumentation included a modular multispectral scanner and metric cameras loaded with color and false color infrared film. LANDSAT MSS and M2S digital data were computer-processed at the Jet Propulsion Laboratory. A trophic state index was developed using the contact-sensed water quality data. Regression models were developed, using MSS and M2S data, to estimate trophic state and selected trophic state indicators. LANDSAT lake surface estimates were compared to those derived from the aerial photography. Thematic photo maps were computer-generated using water truth-scanner data relationships.

FINAL OUTPUT: A report describing the project results will be used by state and federal monitoring agencies.

PROGRESS: Trophic ranking of Colorado lakes using LANDSAT and NASA Overflight data compared favorably to rankings obtained using contact-sensed data. Several problem areas were defined for further investigation. Publication of the project report is projected for June 1979.

Project report, 'Trophic Classification of Selected Colorado Lakes: Lake Classification through the Amalgamation of Contact-Sensed Data and Digitally Processed Multispectral Scanner Data Acquired by Satellite and Aircraft' was jointly published with NASA, Office of Space and Terrestrial Applications, Environmental Observations Division, Washington, D.C.

SUPPORTED BY U.S. Environmental Protection Agency, Office of Research & Development, Environmental Monitoring & Systems Lab.

5.0036, CLIMATIC AND PHONOLOGICAL MODELS FOR RESOURCE PLANNING AND MANAGEMENT

R.O. Gifford, University of Nevada, Reno Campus, School of Agriculture, Dept. of Plant Soil & Water Science, *Reno, Nevada* 89507 (177774 (HRB NO.))

The following tasks will be accomplished: 1. Develop techniques for extending data from limited station locations to areal coverage. 2. Develop techniques to forecast long-term series of events from short-term records. 3. Describe interrelationships between climatic variables. APPROACH: The statistical descriptions of climatic data made under project W-48 will be reexamined for their application to locations other than those for which the data was originally analyzed. Patterns of precipitation at three or more locations will be compared using statistical comparison techniques. Where the patterns are not significantly different they will be used to interpolate the precipitation pattern for locations between them. The minimum amount of local information needed to describe the precipitation pattern using surrounding patterns will be sought using trial and error methods. Similar analyses will be made for temperature patterns. Using the same data base, the length of record required to establish the time pattern of climatic data will be explored by comparing short- and long-term records at a variety of locations. The combined occurrence of climatic elements examined by statistical studies of the precipitation, temperature, solar radiation, and possibly other parameters. The combined occurrences will also be summarized and analyzed in models for potential evapotranspiration and water balance.

SUPPORTED BY University of Nevada

5.0037, USE OF AIRCRAFT SPECTRORADIOMETRY TO DETERMINE WATER QUALITY

H.L. McKim, U.S. Dept. of Defense, Army, Corps of Engineers, Cold Regions Research & Engineering Lab., *P.O. Box 282, Hanover, New Hampshire* 03755 (31583)

OBJECTIVE: To quantitatively assess water quality parameters in fresh and salt water regimes utilizing aircraft spectroradiometer data and to conduct laboratory tests to determine spectral bands of interest for quantitative and qualitative measurement of water quality data to meet Corps of Engineers requirements.

APPROACH: A prototype 500-channel aircraft spectroradiometer instrument with a 10 Angstrom units spectral resolution will be used in the study to assess water quality parameters in fresh and salt water systems. The instrument provides a digital tape read-out for 500 channels ranging from the visible (0.42 microns) to the near infrared wavelengths (1.0 micron) for a minimal 60 by 60 ft. area. Laboratory testing to determine spectral bands of interest will be conducted with the airborne spectroradiometer instrument. The results will be compared to field tests in FY 78 run. Aircraft spectroradiometer flights over selected test site areas will be accomplished in conjunction with ground truth data acquisition. Analysis of the high resolution multispectral data will be used to qualitatively and quantitatively assess water quality parameters, especially turbidity, based on correlation to field measurements.

In addition, the GISS theoretical model will be run with data taken in 1978. Spectral response curves will be generated based on varying the size, optical properties and density of particulate matter. Results from the 1978 aircraft flight analyses and laboratory experiments will be compared to conventional techniques. A cost-effective comparison between conventional techniques and aircraft spectroradiometry to assess quality parameters in fresh and salt water will be made. Procedures to assess water quality will be made for use by Corps of Engineers Division.

SUPPORTED BY U.S. Dept. of Defense, Corps of Engineers, Cold Regions Research & Engineering Lab.

5.0038, NUMERICAL SIMULATION OF THE NEW YORK BIGHT COASTAL WATERS

G.L. Mellor, Princeton University, School of Engineering & Applied Sciences, Dept. of Aerospace & Mechanical Sciences, *Box 430, Princeton, New Jersey* 08540 (R/M-1)

OBJECTIVES: The objective is to construct an advanced, three-dimensional hydro-numerical model which will accurately predict the dynamic and thermodynamic properties of Atlantic coastal waters in response to tidal, surface wind, heat and salinity forcing.

ANTICIPATED BENEFITS: The model will be verified by comparing predictions with N.Y. Bight oceanographic data collected under the NOAA MESA Program. Thereafter, the model can be applied to the prediction of pollutant dispersion and bottom sediment transport; it should then be extended to include ecosystem models.

IDENTIFIED BENEFITS TO DATE: 1.) A published report entitled, 'The Middle Atlantic Bight: A Climatological Atlas of Oceanographic Properties'. 2.) Analysis and simulation of tides. 3.) Simulation of a climatological year for the Middle Atlantic Bight.

SUPPORTED BY U.S. Dept. of Commerce, National Oceanic & Atmospheric Admin., Sea Grant Office

5.0039, FLOW BEHAVIOR OF EXTRATERRESTRIAL MATERIALS

L.C. Klein, Rutgers the State University of New Jersey, Busch Campus, Graduate School, *Piscataway, New Jersey* (EAR79-06771)

This task was originally funded by NASA but has been transferred to NSF for continued support. This study focusses on the viscous flow behavior of extraterrestrial materials - both lunar and meteoritic materials. This study includes an experimental investigation of the effects of oxygen fugacity on flow behavior in lunar materials, such as glassy soils, and in meteoritic materials, such as breccia fragments in howardites, as well as in the Fe-Si-O system. The flow behavior is observed over a wide range of temperatures and oxygen fugacities in order to identify structural aspects of iron-containing silicates, and to evaluate effects of solute redistribution on crystal growth. Experimental measurements are extended to include the intermedi-

ate temperature region in glasses that do not crystallize readily. A semi-empirical model is being formulated to describe flow in the high viscosity region. It is expected that this study will lead to a better understanding of the flow process in iron-containing silicate materials in a variety of environments.

5.0042, THE METEOROLOGICAL VARIATION OF ANTARCTIC AEROSOLS
A.W. Hogan, State University of New York, Albany Campus, Atmospheric Sciences Research Center, *41 State St., Albany, New York* 12203 (DPP7820662)

During the austral summer of 1979-80 and 1980-81, measurements will be made at South Pole Station in Antarctica of the concentrations of aerosols, ozone, carbon dioxide, and other trace chemical constituents at the surface of the ice cap and up to the katabatic return flow above the inversion. In addition, during the austral summer of 1980-81, airborne measurements of aerosols, ozone, and meteorological parameters will be made over Antarctica using a science configured LC-130 logistics aircraft.

These measurements will be used to obtain an improved understanding of (1) the physical properties of and precipitation mechanisms for atmospheric aerosols over the antarctic plateau, and (2) the meteorological processes which transport aerosols to the plateau.

Logistics support is required for two scientists in austral summers of 1979-80 and 1980-81.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Polar Programs

5.0043, NON-NUCLEAR POLLUTANTS IN STRATOSPHERIC AIR
E.P. Hardy, U.S. Dept. of Energy, Office of Health & Environmental Research, Environmental Measurements Lab., *376 Hudson St., New York, New York* 10014 (1783)

The objectives are to document the concentrations of selected stable tracers (particulate and gases) in the stratosphere as a function of latitude, altitude and season; to inventory the stratospheric burdens of these materials; to examine vertical transport in the troposphere; to develop and test stratospheric transport models; and to supply basic data for other scientific programs in studying the ultimate deposition of tracers in the environment. Particulate and gas sampling is conducted by both aircraft (Project Airstream) and balloons (Project Ashcan) in the stratosphere on a seasonally repetitive basis in the northern hemisphere. Aircraft sampling extends from 75 degrees N to the equator at four altitudes up to 63K ft. and balloons are launched in Alaska, Panama and New Mexico to 70, 80, and 90K ft. Data and interpretive analysis are routinely published and distributed to all member nations through the United Nations.

5.0044, OCEAN REMOTE SENSING
G.S. Brown, Applied Science Associates Inc., *Apex, North Carolina* 27502 (DN975312; N00014-79-C-0198)

Precision radar altimeters carried by satellite offer the possibility of measuring and monitoring low amplitude variations in sea level which are indicators of ocean frontal boundaries, geostrophic currents, and subsurface eddy positions. This program will analyze the feasibility of extracting these oceanographic signals from the much larger signal caused by variations in geoid heights, and test the calculations against observed ocean data.

Theory will be developed for relating ocean wave-wave-interaction to the modulation of short capillaries which are responsible for the altimeter signal return. An empirical study of change in backscatter as the satellite passes over frontal boundaries measured in-situ will also be conducted.

5.0048, FEASIBILITY OF GOES DATA RELAY SYSTEM IN THE U.S. GEOLOGICAL SURVEY'S WATER DATA COLLECTION PROGRAM
G.L. Gallino, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Portland, Oregon* (OR 76-079)

Real-time water data are needed in the Pacific Northwest to manage, plan, and develop its water resources in support of hydroelectric-power development, flood control, pollution control, irrigation, and wildlife management. Indivdual agencies are installing their own systems at gaging stations operated by the U.S. Geological Survey. However, use of so many different 'real-time' systems reduces operation efficiency. There is need for an efficient system for use by all. The Geostationary Operational Environmental Satellite (GOES) could provide such a system.

Use the GOES system as a telemetry supplement to existing data-collection facilities to improve the real-time data-collection system. Evaluate the impact of such a real-time system on the WRD program and determine costs and benefits. Develop computerized data-verification programs and appraise the effective-

ness. Compare the accuracy of GOES-acquired data to data acquired by conventional methods.

Use the Bull Run and Sandy River Basins as a test area for the system. The 107-square-mile area is the watershed for the Portland Municipal water supply. Instruments will be installed at one site for stream-stage turbidity and precipitation, three sites for stage and turbidity, four sites for stage alone, and two sites for precipitation and air temperature alone. GOES platforms will be installed at each site. The Portland District will manage the system and the Northwest Water Resources Data Center will check verification methods.

The 10 GOES satellite platforms operated reasonably well during the past year. A letter summarizing progress made toward the objectives: (1) to evaluate the impact of the system on District operations, (2) to determine cost benefits, (3) to develop a computerized verification system and to compare the accuracy of GOES-acquired data with conventionally acquired data, was sent to the Instrumentation Group. The project has been terminated.

5.0050, BLM COOPERATIVE PROJECTS

W.G. Rohde, U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office, EROS Data Center, Applications Branch, *Sioux Falls, South Dakota* 57198

STATE TO WHICH PROJECT PERTAINS: Arizona.

The overall objective is to evaluate the usefulness of LANDSAT film products, computer-compatible tapes, and aerial photographs at several scales for mapping and inventorying wildland vegetation in Northern Arizona.

Standard and enhanced LANDSAT imagery will be manually interpreted to illustrate the extent to which such techniques can be used to map and inventory the area of vegetation communities.

Digital LANDSAT data will be classified to stratify the project area into broad vegetation categories. This stratification will be used to allocate sample units to be photographed with 1:6000 normal color film. Sample units will be allocated proportionately to the area within each stratum. Each aerial photograph will be interpreted and a number of photo plots will be selected, using proportional allocation, and visited on the ground. The photo and ground observations will be used to describe the resource cover types associated with each stratum and to estimate the area of each vegetation cover type.

Digital terrain data will be registered to the LANDSAT data. The terrain data, (i.e., elevation, slope aspect) and the photo data will be used to develop post-classification stratification models to improve the capability of mapping vegetation resources.

SUPPORTED BY U.S. Dept. of the Interior, Land Information & Analysis Office, EROS Data Center

5.0051, APPLICATION OF SATELLITE AND AIRCRAFT IMAGERY TO HYDROGEOLOGY

G.K. Moore, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Sioux Falls, South Dakota* (CR 73-196)

Remote sensing has considerable potential for hydrologic studies, particularly in the visible, infrared, and microwave parts of the spectrum. It offers new information and new tools to the hydrologist and can reduce the field work necessary in conventional studies. Research, testing, and development are needed to obtain operational procedures, however.

(1) Conduct research on the applications of remote sensing to ground-water occurrence, surface drainage characteristics, and water color and turbidity. Develop application examples. (2) Develop enhancement and interpretation procedures for remote sensing imagery and digital data, using both manual and computer processing. (3) Train and consult with other hydrologists on feasibility tests and operational uses of remote sensing. (4) Originate, plan, and coordinate programs and projects in remote sensing.

(1) Analyze existing data for hydrologic information; develop procedures for information extraction. Evaluate effects of atmosphere and soil and vegetation cover. (2) Evaluate existing procedures for manual and digital processing. Determine need and utility of new procedures. (3) Conduct training courses and briefings. (4) Work with WRD, EROS, and NASA personnel to originate and coordinate remote sensing applications to hydrologic problems.

Talks, briefings, and training lectures were given at EROS Data Center, Natl. Space Technology Labs, SD State Univ., Murray State Univ., and one WRD District. A formal paper was presented at the World Water Conference in Mar del Plata, Argentina. Work on the Yampa Basin and Johnstown flood was completed and underway, respectively. Research on water color and turbidity was completed. Personnel from five districts were given training in digital processing of LANDSAT data.

Conduct training courses in hydrologic remote sensing. Begin research on relationship of source areas to stream flows. Continue work on Johnstown flood. Prepare formal paper on water turbidity. Continue training in digital processing. Prepare lecture notes for training courses.

5.0053, IMPACT OF GASEOUS SULFUR AND AEROSOLS PRODUCED BY POWER PLANTS ON THE CCN BUDGET

V.K. Saxena, Utah Higher Education System, University of Utah, School of Science, Dept. of Meteorology, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (7963)

A comprehensive program to study the regional transport and dispersion of sulfur and chlorine particles is proposed. The study is aimed at determining the variability of CCN upwind and downwind of the power plants, investigating the growth and formation of CCN in the plane plume, and determining whether the gaseous sulfur-to-sulfate conversion processes give rise to a secondary maximum in the CCN concentration downwind of the plume. Our newly developed CCN spectrometer will be used. It is capable of producing real-time measurement and display of the entire CCN spectrum within as short a time interval as 15 seconds. Airborne measurements abroad a DC3 aircraft will be made. One of the most fascinating aspects of the proposed study is the utilization of the CCN activity spectrum as a natural tracer of the air mass history. The proposed study will help MAP3S in four respects. First, the submicron cycle and therefore a study of their transport is needed. Second, they represent the fingerprints of a pollution plume in terms of their activity spectrum and are the best tracers of air originating from urban-industrial areas. Third, they have been shown to be derived from the gaseous sulfur-to-sulfate conversion processes and are involved in the acid rain. Fourth, larger sulfate particles directly emitted from power plants may form haze at ambient relative humidities thereby degrading the visibility.

5.0055, PETROLOGIC STUDY OF RETURNED LUNAR SAMPLES

E. Roedder, U.S. Dept. of the Interior, Geological Survey, *12201 Sunrise Valley Dr., MS 912, Reston, Virginia* 22092 (EAR79-06760)

This study is a continuation of work previously funded by NASA which has now been transferred to NSF for support. This study is aimed at understanding planetary processes and history through the study of inclusions in selected geological samples. Investigations will be made in the area of understanding the phenomena of trapped melt inclusions in crystallized silicate materials. These studies will assist in interpreting the complex differentiation trends evident in the gross compositions of the host materials as well as those of silicate melt immiscibility. The study has wide application to the area of terrestrial mineralogy and petrology as well as planetary geoscience.

5.0057, REMOTE SENSING/WASTE DISPOSAL

L.C. Rowan, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *12201 Sunrise Valley Dr., Reston, Virginia* 22092 (9790-02015)

STATES TO WHICH PROJECT PERTAINS: New York, Pennsylvania, Utah, Maine, South Dakota.

The objectives are to delineate landforms using satellite and aircraft images that may reflect subsurface and surface geologic structures. During this year, emphasis will be placed on statistical analysis of identified lineaments to determine regional trends and on detailed field and aircraft image studies of selected lineaments to characterize these features. In both cases, geophysical data, including aeromagnetic maps, seismic profiles, and gravity maps and subsurface stratigraphic data will be used to relate the lineaments to subsurface structures. Ultimately, this approach should permit characterization of large regions where detailed mapping of geophysical and subsurface stratigraphic data are only locally available.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0058, REMOTE SENSING/CUSMAP

L.C. Rowan, U.S. Dept. of the Interior, Geological Survey, Geologic Div., *12201 Sunrise Valley Dr., Reston, Virginia* 22092 (9790-02074)

STATES TO WHICH PROJECT PERTAINS: Utah, Nevada, Arizona, Missouri.

Emphasis will be placed on compilation of digital image processing of LANDSAT images for mapping lineaments and other landforms and limonitic hydrothermally altered rocks. Analysis of these data involves both photointerpretative and statistical methods to identify the most significant features for localization of ore deposits. High-altitude aircraft photographs and other images will be used to supplement the LANDSAT data. Results will include maps showing the distribution of lineaments and limonitic altered rocks which later will be integrated with other geophysical, geochemical, and geologic field mapping data. Another important aspect of these investigations is the acquisition, processing, and analysis of multispectral aircraft data for overcoming some of the limitations imposed by the spectral bands used in the LANDSAT scanner.

SUPPORTED BY U.S. Dept. of the Interior, Geological Survey, Geologic Div.

5.0059, OXYGEN FUGACITIES OF EXTRATERRESTRIAL MATERIALS AND REDOX REACTIONS

M. Sato, U.S. Dept. of the Interior, Geological Survey, Geologic Div., Experimental Geochemistry & Mineralogy Branch, *12201 Sunrise Valley Dr., Reston, Virginia* 22092 (EAR79-08578)

This work is a continuation of studies previously funded by NASA but which have been transferred to NSF. The project is primarily responsible for determining oxygen fugacity values of lunar rocks, meteorites, and other planetary matter to provide basic data on the oxygen fugacities of rocks and minerals in the Solar System. On the basis of these data and other available information such as the behavior of volatile matters, we evaluate the causes and mechanisms of redox reactions that occurred during the formation of planetary bodies and magmatic activities.

5.0060, LAND USE CHANGE DETECTION AND MAP UPDATE

V.A. Milazzo, U.S. Dept. of the Interior, Geological Survey, Land Information & Analysis Office, *12201 Sunrise Valley Dr., Mail Stop 710, Reston, Virginia* 22092 (G-25)

Conduct actual test and demonstration studies in select area(s) using approaches and techniques of change detection and map update previously recommended. Investigate the interpretive and cartographic aspects in identifying and mapping land use changes and in selectively updating land use maps. Establish standard procedures and techniques to be used by compilers in updating land use and land cover maps.

Refine criteria and procedures for selecting areas for land use update. Begin preliminary development of a workable set of standard and routine guidelines for update selection that can be used in an operational map update program.

Begin evaluation of likely candidate areas for map update in a first-round update program. Consider use of LANDSAT for targeting areas for possible update. Conduct search of available remote sensing sources and explore opportunities for new photo source acquisition under proposed Federal High-Altitude Photography Program as well as improved techniques in the use of LANDSAT digital data for change detection and map update. Establish preliminary areas for map update.

Continue to work with Topographic Division, state and regional cooperators and NASA in the areas of land use change

detection and map update already developed and pursue areas of further cooperation.

5.0061, RESEARCH AIRCRAFT OPERATIONS
C.L. Simpson, U.S. Dept. of Energy, Battelle Pacific Northwest Lab., *P.O. Box 999, Richland, Washington* 99352 (000556; EY-76-C-06-1830)

The purpose of this program is the provision of technical support for DOE-DBER Atmospheric Research programs, in the form of airborne laboratories and tracer-release facilities. Aircraft support is required especially for the following Atmospheric Sciences programs: Precipitation Scavenging, Atmospheric Boundary Layer Studies, Particle Resuspension and Translocation, Cooling Tower and Cooling Pond-Atmospheric Impact, Aerosol and Trace Gas Transformation, and Urban Pollution and Tracer Studies. Two aircraft, a Cessna-411 and a Douglas DC-3, have been equipped with tracer release facilities as well as the necessary instrumentation for highly sophisticated measurements of cloud physics, aerosols, pollutant-gases, atmospheric tracers, and turbulence.

5.0062, POLAR ICE REMOTE SENSING
W.J. Campbell, U.S. Dept. of the Interior, Geological Survey, Water Resources Div., *Tacoma, Washington* (WR 70-064)

One of the fastest varying large-scale features on the earth's surface is sea ice. Theoretical studies show the ice canopy in polar regions to be of major importance in (1) determining the global heat balance, and (2) determining the vapor flux of water into temperate regions. In order to test the developing numerical models of polar regions it is necessary to acquire sequential large-scale synoptic data over polar regions. Remote sensing, especially in frequencies in the microwave range, appears to offer the best chance of obtaining these data.

As investigators for Sea Ice for NASA and the Spacecraft Oceanography Center-NOAA, we will design polar remote sensing experiments using NASA and other agency remote sensing aircraft and satellites. Aircraft and satellite experiments will be coordinated with necessary ground truth networks for the remote sensing systems. The basic premise for these plans will be to develop the correct remote sensing means to acquire data that will be useful in testing numerical models of sea ice and glacier ice.

J.E. Campbell, U.S. Dept. of Health Education & Welfare, Public Health Service, Food & Drug Admin., Bureau of Foods, *200 C St. S.W., Washington, District of Columbia* 20204 (04068)

STATEMENT OF OBJECTIVES: a. Provide technical support and advice on the efficacy of sterilization cycles and the expected microbiological loading on spacecraft components to the Chief, Planetary Biology Program; and b. conduct research on the mechanism of thermal inactivation of microorganisms and investigate ways and means of improving the effectiveness of sterilization cycles.

DESCRIPTION OF WORK: 1. Determine the heat resistance of B. megaterium, B. cereus, Cl sporogenes and an unknown soil anaerobe in the closed can system. An attempt will be made to develop predictive models based on time, temperature and humidity. 2. Examine the possibility that a measure of the internal osmotic pressure of the spore can be related to thermal resistance. 3. Determine the thermal resistance of S. typhimurium, S. senftenberg 775W in the can system and specifically constructed oven at one or more temperatures. At least 8 relative humidities will be examined.

6.0008, ENVIRONMENTAL INTERACTIONS WITH THE AGING PROCESS
G.A. Sacher, U.S. Dept. of Energy, Div. of Biological & Medical Research, *9700 S. Cass Ave., Argonne, Illinois* 60439 (001541; W-31-109-ENG-38)

This program is concerned with the effects of environmental pollutants on the daily (diel) cycles of energy metabolism, motor activity, and body temperature in small rodents. These processes can be measured accurately and continuously on unrestrained animals. The hypothesis is that they are sensitive indicators of the health status of the animal, including expectation of disease morbidity and survival. We have gone a considerable way toward validating this hypothesis, and are beginning to in-

vestigate the effects of specific pollutants. The purpose is, first, to characterize the effects of each pollutant, and second, to determine whether these effects predict the subsequent health history of the animal. Energy-related pollutants currently under examination are ionizing radiations, ingested lead, and high-voltage electric fields. Diel cycles of metabolism, activity, and temperature can be logged continuously and automatically for several individual mice simultaneously for periods up to 2 weeks. The search for indicator variables has thus far been limited to the energy expenditure variable, and has revealed 3 variables that predict the length of life, i.e., resting metabolic rate (negative correlation), ratio of average to resting metabolic rate (positive correlation), and change of metabolic rate from youth to old age (negative correlation). The search must now be extended to the activity and temperature variables, which have become functional only recently. The initial phase of work with pollutants will be focused on radiation variables both ionizing and non-ionizing. The non-ionizing radiations to be examined are 60 Hz electric fields and 2450 MHz microwaves, as produced by the proposed Solar Power Satellite system.

8.0001, RESEARCH IN THEORETICAL ELEMENTARY PHYSICS
L. Susskind, Stanford University, Graduate School, *Stanford, California* 94305 (PHY78-26847)

Research will be done in theoretical physics to further our understanding of elementary particles, quantum field theory, and related areas of solid-state physics, statistical mechanics, astrophysics and cosmology. Topics include: 1) Quantum chromodynamics, focussing on questions related to quark confinement, 2) Quantum field theory in environments of extreme temperature, density, or pressure, 3) Elementary particle physics of the very early universe, and 4) Dynamical mechanisms for symmetry breaking-in theories of the electro-weak force.

This is the first year of a four-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0002, ELECTROMAGNETIC PROPERTIES OF LAYERED SUPERCONDUCTING STRUCTURES
M.R. Beasley, Stanford University, School of Humanities & Sciences, Dept. of Applied Physics, *Stanford, California* 94305 (DMR79-11117)

Research supported under NSF Grant DMR75-04368 will be continued and extended. This research involves a comprehensive experimental effort to fabricate, characterize and study the superconducting properties of layered and quasi-two-dimensional superconductors. Materials of interest include the naturally occurring layered compounds, artifically layered composites and very thin films. The relationship between the layered and/or two-dimensional nature of such superconductors and their electromagnetic properties will be investigated. Particular emphasis will be placed on detailed studies of the critical magnetic fields and critical current densities of such systems, the effect of layering on the superconducting transition temperature, and the onset of resistance in two-dimensional superconductors.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0003, MATERIAL SUPPORT TECHNOLOGY - TUNNELLING INVESTIGATION OF QUASI-ONE-DIMENSIONAL MATERIALS
P.M. Chaikin, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Physics, *405 Hilgard Ave., Los Angeles, California* 90024 (DN675684; N00014-76-C-1078)

The Navy has need for new electronic materials that offer improved performance in operational systems. This program will provide needed information on the electronic properties of a class of materials that holds promise for such increased capabilities in communications and surveillance.

The investigator will use electron tunnelling to investigate a series of quasi-one-dimensional materials of considerable current interest. These materials fall into the categories of polysulfur nitride, the charge transfer salts based on tetracyano-quinodimenthane (TCNQ), and metallo-organic salts based upon platinum cyanide (KCP). All have unusually anisotropic electronic and vibrational properties and undergo phase transitions at low temperatures that are associated with Peierl's distortions. Studies in polysulfur nitride will focus on the temperature dependence of the superconducting energy gap while those in the TCNQ salts will initially focus on the phase transition.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0004, EXPERIMENTAL STUDIES OF CRITICAL SYSTEMS
D.S. Cannell, University of California, Santa Barbara Campus, School of Letters & Science, Dept. of Physics, *Santa Barbara, California* 93106 (DMR79-10030)

Accurate light-scattering measurements of the static and dynamic properties of a model critical fluid, xenon, at temperatures very near its critical point, will be performed in order to observe slight corrections to asymptotic scaling. Sound velocity studies on the same model system, together with the correlation-range data obtained from the first experiments, will be used to compare sound speed and attenuation with theory. A light-scattering study of spinodal decomposition will also be performed in a binary fluid mixture chosen to minimize multiple scattering; very rapid quenches will be achieved by using pressure changes. Finally, studies of the kinetics of carbon monoxide adsorption on nickel films will be completed and extended to other substrates, and epitaxial films for such studies will be grown.

Research previously supported under DMR 7618962 A01.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0005, THEORETICAL STUDIES OF THE INTERFACE ELECTRONIC PROPERTIES OF TETRAHEDRALLY COORDINATED SEMICONDUCTORS
A. Madhukar, University of Southern California, Electronic Sciences Lab., *3551 University Ave., Los Angeles, California* 90007 (DN775385; N00014-77-C-0397)

As solid-state devices such as field-effect transistors, which are found in naval electronic systems, become more compact and more surface-oriented in their electrical transport behavior, they begin to be dominated by surface- and interface-related effects. This program will seek to find better understanding of the electronic properties of interfaces formed between tetrahedrally coordinated semiconductors and of transport properties of inversion layers formed at a semiconductor-insulator interface.

Green's function techniques are applied to problem areas. In one case theoretical studies are made of the properties of solid-solid interfaces, the Schottky barrier and heterojunction problems. Tight binding Hamiltonians are used to calculate interface states and charge redistribution at interfaces, including the effects of short-range electron-electron interactions. These techniques are now being extended to the case of superlattice

structures in various binary III-V compound semiconductor systems. The other area of study is that of the electronic and transport properties of surface inversion layers. The major thrust is to consider both electron-electron and electron-phonon interactions in describing the experimental results of mass enhancement in Shubnikovdehaas and cyclotron resonance measurements.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0006, THEORETICAL STUDY OF SOLITON PHENOMENA IN CONDENSED MATTER

S.E. Trullinger, University of Southern California, School of Letters Arts & Sciences, Dept. of Physics, *3551 University Ave., Los Angeles, California* 90007 (DMR79-08920)

Research previously supported by DMR7708445.

The importance of localized soliton solutions of nonlinear wave equations in condensed matter physics has grown tremendously in the last few years, and soliton phenomena in condensed matter now forms a major and very exciting area of materials research.

Research in the areas of soliton statistical mechanics and response to perturbations will be continued in three exciting new areas as well. These include: (1) a study of the quantum-mechanical behavior of electrically charged solitons (called phi-particles) in charge-density-wave systems, in order to determine whether the phi-particle gas exhibits any instabilities, one possiblity being a superconductive instability, (2) a study of the nonlinear behavior of charge-density-waves in the linear chain conductor niobium-triselenide with emphasis on the role of soliton-like 'discommensurations' in the non-Ohmic conductivity process which has been recently observed and, (3) a study of the phenomenon of self-induced transparency in dense matter in order to establish the conditions for the appearance of new propagating modes (multi-solitons). This phenomenon may provide the basis for an ultrashort-light-pulse generator having importance for laser-induced fusion. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0007, LOWER BOUNDS TO EIGENVALUES IN ATOMIC PHYSICS

R.N. Hill, University of Delaware, School of Arts & Sciences, Dept. of Physics, *Newark, Delaware* 19711 (PHY79-06936)

This research focuses on methods of computing lower bounds to discrete eigenvalues in atomic physics. The primary objectives are (1) proofs of nonexistence for bound states (of negative ions) which do not exist, and (2) computation of tight lower bounds, comparable in accuracy with Rayleigh-Ritz upper bounds, for bound states which do exist. The results, which are expected to include both rigorous proofs and accurate numbers, should be of interest to mathematical physicists who work on the rigorous theory of the Schrodinger equation with coulomb interactions, to atomic physicists and quantum chemists, and to applied mathematicians who work on the general problem of eigenvalue estimation.

A knowledge of the exact number of bound states of specific negative ions is important for scattering theory, and for theories of absorption. For example, the principal process responsible for the opacity of the solar photosphere is the continuous absorption by the H-ion; the predicted absorption coefficient would be modified if H- had an additional bound state below the continuum. Highly accurate calculations of bound state energies of atoms are important when relativistic corrections are being explored, and/or when experimental determination of these energies is difficult or impossible. Moreover, the accuracy of an approximation can only be assessed with certainty if both upper and lower bounds are available. The upper bounds are easily obtained from Rayleigh-Ritz. The lower bounds have, at least in the past, been more difficult to obtain. This project represents an attempt to provide the latter.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0008, ANALYSIS OF TRACE IMPURITIES IN SEMICONDUCTOR MATERIALS

S. Mayo, U.S. Dept. of Commerce, National Bureau of Standards, Electronic Technology Div., *14th & Constitution Ave. N.W., Washington, District of Columbia* 20234 (DN975471; N00014-79-F-0051)

Improvement in electron devices for Navy systems and development of new devices in the future depends on better understanding and control of impurities in semiconductor materials. New, precise techniques to analyze semiconductors for trace impurities, which influence the electronic and optical properties of materials, must be developed to improve material growth and doping programs.

Laser radiation will be used to resonantly excite and ionize atoms in a special ionization chamber in which the electron-ion pairs produced can be detected. This resonance ionization spectroscopic (RIS) technique will be developed and applied to a variety of impurities found in silicon, gallium arsenide, and other semiconductors. High energy laser radiation will impinge on solid samples creating a spallation of atoms from the surface. These atoms will then be subjected to the RIS technique. Parameters must be investigated in order to obtain absolute quantitative measurements of trace impurity concentrations. Subsequently, these methods will be used to profile the impurity concentration as a function of depth into the sample.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0009, PLASMA THEORY

T. Coffey, U.S. Dept. of Defense, Navy, Naval Research Lab., *4555 Overlook Ave. S.W., Washington, District of Columbia* 20375 (DN980032)

The Linus program at NRL is attempting to apply imploding liner flux compression techniques and advanced plasma source techniques to the generation and confinement of high-energy density plasmas. Such techniques have application to high-pulsed power generation, nuclear fusion and nuclear weapons effects simulation. NRL has developed techniques for stabilized liner implosions in which the liner motion is contractible and reversible. This is in contrast to the more conventional explosively-driven liners. The objective of the present program is to provide the theoretical support needed for the interpretation of experimental results and their extrapolation to larger systems.

This project will utilize advanced techniques in plasma physics and fluid mechanics for modeling the dynamics of imploding liners, liner magnetic field interface and the properties of liner compressed plasmas. The program will be significantly integrated with on-going experimental activities at NRL.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Research Lab.

8.0010, GENERATION AND DETECTION OF MICROWAVE PHONONS

H.N. Spector, Illinois Inst. of Technology, Lewis College of Sciences & Letters, Dept. of Physics, *3300 S. Federal St., Chicago, Illinois* 60616 (DMR76-24466 A02)

Investigation of the generation and detection of microwave phonons in semiconductors, previously supported by NSF Grant DMR 7624466, will be continued. The work involves the theoretical investigation of such as the enhancement of the generation of phonon echoes in semiconductors in the presence of d.c. electric and magnetic fields, the enhancement of up-conversion effects in the microwave frequency region, and the detection of microwave phonons by the mixing of two phonon beams to generate a microwave electric field. In addition, the acoustoelectric interactions due to both deformation potential and piezoelectric coupling, in a frequency range which has not been readily accessible, will be investigated.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0011, SHALLOW DONOR IMPURITIES IN HIGH PURITY SEMICONDUCTORS
G.E. Stillman, University of Illinois, Urbana Champaign Campus, Graduate School, *Urbana, Illinois* 61801 (DN880264; TBD)

Microwave and millimeter wave devices and systems are needed for Navy and DOD applications. The active semiconductor materials used or contemplated being used in many of these devices include the III-V semiconductors, gallium arsenide and indium phosphide. In order to fully understand these materials the amount and type of native impurities must be determined.

The total donor and acceptor levels in gallium arsenide shall be determined by conventional means such as Hall measurements and photoluminescence. High resolution for infrared Fourier transform spectroscopy will be used for determination of shallow donor spectra. Comparison of various crystal growth and epitaxial techniques will be made to determine residual donor levels and their dependence on processing techniques and parameters.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Research Lab.

8.0012, VIBRATIONAL RELAXATION OF EXCITED SPECIES OF INTEREST TO CHEMICAL LASERS
L.H. Sentman, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Aeronautical & Astronautical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801

A classical model for the interaction of two rotating, dissimilar diatomic molecules under the action of a Morse potential has been developed. Relaxation times for V-R, T and V-V, R energy transfer have been calculated and compared with experimental data over the temperature range 250-5000 degrees K. Good agreement between experiment and theory is obtained for the V-R, T self-relaxation of H(D)F, H(D)Cl, HBr and H(D)I and for the V-V, R relaxation of HF-N2. It is shown that the attractive forces are important only in the self-relaxation of H(D)F, and that the dominant energy transfer mechanism in the self-relaxation of H(D)Cl, HBr and H(D)I, inter-molecular energy transfer is the dominant mechanism.

SUPPORTED BY University of Illinois

8.0013, RESONANCE IONIZATION SPECTROSCOPY OF ATOMS
M.H. Mayfeh, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Physics, *Urbana, Illinois* 61801 (PHY78-25247)

This project in atomic physics will exploit the recently developed techniques of resonance ionization spectroscopy, in which a particular species of atom is selectively ionized by absorption of several photons of light of well-defined frequency from a laser. Only a small number of atoms is necessary for successful detection. Particular experiments will include the study of optical and radiative collisions and photoionization cross-sections of short-lived excited states.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0014, KINETICS OF PHASE TRANSITIONS
H. Sato, Purdue University, School of Materials Engineering, *Life Sciences Bldg., West Lafayette, Indiana* 47907 (DMR79-03932)

Research previously supported by DMR7621497.

Theoretical research of irreversible phenomena in crystalline solids, aimed at elucidating nonlinear processes which occur in states far from equilibrium, will be carried out. The method to be used is the Path Probability method of irreversible statistical mechanics, and the phenomena to be studied are those of specific interest in materials science such as the kinetics of order-disorder transformations, the nature of glass transitions and fast ionic transport in solid electrolytes. Through the study of the above problems, the foundations of kinetic processes will be reexamined. Based on the progress made concerning the general description of kinetic processes which occur in systems undergoing phase transitions of second order, basic processes involved in the phase transitions of first order, such as nucleation processes, crystal growth and the necessary theoretical tools for these processes, will be examined.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0015, VARIATIONAL PRINCIPLES FOR SOME PROBLEMS IN ATOMIC PHYSICS
A.R. Rau, Louisiana State University, Agricultural & Mechanical College, School of Arts & Sciences, Dept. of Physics, *University Station, Baton Rouge, Louisiana* 70803 (PHY76-05721 A01)

Research on atomic theory initiated under NSF grant PHY76-05721 will be continued and expanded. Amongst the topics to be considered will be: (A) Variational Principles for Mathematical-Physics Problems, 1) General construction of variational principles, 2) Variational principles for electron degradation in a medium, 3) Variational principles for hierarchical equations (BBG KY and Born-Green-Yvon) arising in statistical physics; (B) Effects of External Fields on Rydberg States, 1) WKB calculations of helium-layer system, 2)Atoms in external fields.

8.0016, BAND THEORY OF FERROMAGNETIC METALS
J. Callaway, Louisiana State University, Agricultural & Mechanical College, School of Chemistry & Physics, Dept. of Physics & Astronomy, *University Station, Baton Rouge, Louisiana* 70803 (DMR78-17806)

Research previously supported by DMR7619850. Theoretical research on the electronic structure of itinerant ferromagnets will be carried out. In particular, the recently developed methods of energy band theory will be applied to understand various magnetic and transport properties of metals such as nickel and cobalt. Of primary interest will be the calculation of the spin wave excitation spectrum and the dynamic magnetic susceptibility in these materials. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0017, NEUTRON SCATTERING IN MAGNETIC MATERIALS
J.W. Lynn, University of Maryland, College Park Campus, School of Engineering, Dept. of Physics & Astronomy, *College Park, Maryland* 20742 (DMR79-00908)

Neutron scattering experiments will be carried out to examine phase transitions in a number of magnetic materials. Special attention will be given to materials which exhibit the coexistence of magnetism and superconductivity, to the spin-flop transition and bicritical point in uniaxial antiferromagnets and to the spin-fluctuation spectra of isotropic ferromagnets just below the Curie temperature. This is a renewal of DMR 7681185. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0018, STRUCTURE OF GRAIN BOUNDARIES
R.W. Balluffi, Massachusetts Inst. of Technology, Graduate School, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (DMR7812804)

This is a basic investigation of the detailed atomic structure of grain boundaries. The atomic configuration in bi-crystals of gold will be modelled by computer simulation. The experimen-

tal work will be done by S. Sass of Cornell University. The research to be undertaken will include: (1) determination of the grain boundary core structure: the atomic structure of the core of a range of boundaries of different angles will be calculated by computer simulation; the x-ray structure factors will then be calculated and compared with measurements of the diffraction from boundaries of these same types performed by Sass at Cornell; (2) determination of the core structure of grain boundary dislocations (GBDs) of different angles: the structure of the core of GBDs in a range of boundaries will be calculated; the electron diffraction contrast produced by the GBDs will be calculated and compared with the experimentally observed contrast from GBDs of the same type; and (3) determination of the anisotropy of the boundary energy and the occurrence of faceting: systematic observations of the faceting of a series of predetermined boundaries will be made; computer calculations of the corresponding boundary structures and energies will then be made, and predictions of faceting will be made and compared with experiment. The initial calculation can be extended to grain boundaries in other materials, both pure elements and alloys. It is expected that the results of this research will enhance significantly our understanding of the nature of grain boundaries. This is the first year of a three-year continuing grant.

8.0019, MONOLAYER FILMS ADSORBED ON HIGHLY UNIFORM, WELL-ALIGNED GRAPHITE SUBSTRATES

M. Bretz, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Physics, *Ann Arbor, Michigan* 48104 (DMR79-03614)

This research is a continuation and extension of work supported under Grant No. DMR-7620369. Monolayer helium and hydrogen films adsorbed on highly uniform and well-aligned graphite substrates will be studied with emphasis on two-dimensional superfluid onset phenomena. A newly perfected ac calorimetric technique will be used to measure the heat capacity of sub-monolayer films of helium and hydrogen adsorbed on different substrates. The increased sensitivity of this technique will permit the obtaining of definitive data for layers as thin as 0.25 monolayers. Present facilities are being upgraded to include a pulsed NMR system for the study of ultra-thin films of helium-4.

This is first year of a three-year continuing grant.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0020, MAGNETIC INVESTIGATION OF SOME NEW QUASI TWO-DIMENSIONAL MAGNETIC SYSTEMS

J.E. Drumheller, Montana State University, School of Letters & Sciences, Dept. of Physics, *Bozeman, Montana* 59715 (DMR79-05588)

Lower-dimensional magnetic systems will be studied using a variety of physical techniques such as paramagnetic resonance, optical and infrared spectroscopy, and electric conductivity. Two important but often neglected features of these systems will be investigated--structural phase transitions and the role of antisymmetric exchange in the magnetic properties. Experiments using Raman scattering and high resolution magnetic susceptibility will be carried out to examine the complete exchange interaction including the antisymmetric term. New lower-dimensional magnetic systems will be studied in which mixing of two magnetic ions can occur.

This research was previously supported under DMR 7682089.

8.0021, REGIONAL INSTRUMENTATION FACILITY FOR A SURFACE SCIENCE AND SUBMICRON ANALYSIS LABORATORY

G.J. Lapeyre, Montana State University, School of Letters & Sciences, Dept. of Physics, *Bozeman, Montana* 59715 (CHE79-16134)

A regional instrumentation facility for surface science and submicron analysis will be established at Montana State University. It will include capabilities for x-ray and ultraviolet photoelectron spectroscopy and scanning Auger microprobe and many ancillary measurements. This facility will serve the instrumentation needs in a diverse number of disciplines including materials science, earth sciences, microbiology, mineralogy, engineering, and physics. Research to be conducted at the facility includes: 1) Angular resolved photoemission studies of clean and chemisorbed surfaces; 2) Surface density of states for normal photoemission; 3) Corrosion effects in molten carbonate systems; 4) Segregation of trace impurity elements in grain boundaries; 5) Characterization of insulating and semiconducting thin films. It will bring an important resource to a diverse group of academic, industrial, and governmental laboratories. This facility will serve the northwestern region of the United States. Independent and collaborative research will be an important thrust of the facility in addition to providing a state-of-the-art measurement capability for concerned scientists.

8.0022, NMR STUDIES OF PHASE TRANSITIONS IN RARE GAS SUBMONOLAYERS

H.Y. Carr, Rutgers the State University of New Jersey, New Brunswick Campus, School of Arts & Sciences, Dept. of Physics, *Old Queens Bldg., New Brunswick, New Jersey* 08903 (DMR7823956)

Nuclear magnetic resonance (NMR) experiments will be carried out to observe density and temperature-dependent local magnetic fields in the gas-like and solid-like phases of rare gas sub-monolayers. In particular, the 2-dimensional 'liquid-vapor' and 'liquid-solid' phase transitions will be studied in these systems by observing the local-field discontinuities between phases. The rare gas will be adsorbed on graphite substrates. Other substrates will be investigated.

Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0024, ULTRAFAST ELECTRONIC RELAXATION OF HIGHLY PHOTO-EXCITED MATERIALS

H. Mahr, Cornell University, Ithaca Campus, School of Arts & Sciences, Dept. of Physics, *Ithaca, New York* 14850 (DMR78-16751)

Ultrafast relaxation of excess electron and hole populations will be studied in direct gap semiconductors and other materials. The evolution of electron and hole relaxation will be monitored on a picosecond time scale by measuring time-resolved spectra of luminescence emitted by the sample, using a unique picose-

cond time-resolution luminescence spectrometer based on c.w. mode-locked, tunable dye lasers. In particular, the following will be studied: (1) the properties and time-history of an electrode-hole-droplet phase in CdSe/CdS crystals at helium temperatures, (2) the relaxation of an electron-hole plasma and its transition in time to an insulating excitonic phase (Mott transition) in CdSe and CdSe/CdS crystals at higher temperatures than helium, and (3) other electron-hole-droplet phases of unusually high critical temperatures and in materials quite different from the typical II-VI semiconductors CdS and CdSe.

This is the first year of a three-year continuing grant.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0025, A THEORETICAL INVESTIGATION OF ATOMIC SCATTERING PROCESSES

L. Spruch, New York University, Washington Square & University College of Arts & Sciences, Dept. of Physics, *421 1st Ave., New York, New York* 10012 (PHY79-10413)

Research in theoretical atomic physics initiated under NSF grant PHY77-10131 will be continued. Among the topics to be investigated are: 1. Effect of target ionization on electron-atom scattering in a radiation field; 2. Electron-ion scattering in a radiation field; 3. Generalization of the low-frequency approximation for scattering in a laser field; 4. Variational principle for the scattering length for target ground state wave function imprecisely known; 5. Analytic form for the generalized oscillator strength; 6. Lamb shift for an electron image bound by a conducting wall; 7. Charge transfer at high but not asymptotically high impact velocities; 8. Variational principle for charge transfer for target ground state wave function imprecisely known; 9. Extreme principle estimation of transition rates for the emission of photons by low Z excited atoms in intense magnetic fields; 10. Electric dipole polarizability of the neutron.

This is the first year of a four-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,

8.0026, PHYSICAL PROPERTIES OF NARROW SUPERCONDUCTING FILMS AND ARRAYS

Y. Kao, State University of New York, Stony Brook Campus, School of Arts & Sciences, Dept. of Physics, *Stony Brook, New York* 11790 (DMR77-04511 A02)

This research is a continuation of work begun under NSF grant No. DMR73-07494. The properties of superconducting microbridges, Josephson junctions and arrays of Josephson junctions will be studied in order to develop sensitive radiation detectors. Computer-controlled electron-beam lithography will be used to fabricate superconducting microbridges which range in size from a few thousand angstroms to a few microns. The physical properties of individual bridges will be studied and a special emphasis will be placed on the coupling between adjacent bridges. Measurements will be made to study non-equilibrium effects and the dynamics of superconducting pairs in arrays of Josephson junctions. A primary goal of the research is to understand the coherent properties of arrays of weakly coupled superconductors.

SUPPORTED BY U.S. National Science Foundation,

8.0027, COHERENCE EFFECTS IN QUANTUM OPTICS

L. Mandel, University of Rochester, School of Arts & Sciences, Dept. of Physics & Astronomy, *260 Crittenden Blvd., Rochester, New York* 14627 (PHY79-06349)

This is a proposal for support of research on various interactions between light and atomic systems, in which coherence and cooperative effects play a significant role. These interactions may involve both multiphoton and multiatom processes, and they have become especially accessible to investigation with the development of tunable lasers.

Research will continue on coherence effects in quantum optics. This includes: resonance fluorescence, in which the photon statistics of atomic emission will be investigated; resonant radiation pressure effects on atoms; and laser phase transitions, particularly those in which a first order phase transition of the electromagnetic field can be achieved.

This research is a continuation of that previously supported under NSF grant PHY77-07108A01.

This is the first year of a three-year continuing grant.

8.0028, SINGLE ATOM INTERACTIONS AND SURFACE SEGREGATION OF DILUTE ALLOYS USING ATOM-PROBE AND FIELD ION MICROSCOPY

T.T. Tsong, Pennsylvania State University, University Park Campus, School of Science, Dept. of Physics, *211 Whitmore Lab., University Park, Pennsylvania* 16802 (DMR79-04862)

The unique atomic resolution of the field ion microscope (FIM) will be used to investigate systematically the interaction between two atoms, both adatom-adatom and adatom-substitutional atom interactions, on group VIII and IB surfaces. The atomic interaction will be correlated with the electronic structures of adatoms and substrate surfaces, and the directional walk of single atoms under a controllable driving force will also be investigated. This information is not only of fundamental interest, but is also related to the surface reactivity. Since the unique catalytic activity of a surface arises partly from surface segregation of minority species in the alloy, the absolute composition depth profiles of near surface layers of dilute alloys will also be measured using the single atomic layer spatial resolution of the Time-of-Flight Atom-Probe FIM. The dependence of the composition of near surface layers on the bulk concentration of minority species, the sample temperature, and the crystal planes will be investigated, as well as the kinetics of reaching thermodynamic equilibrium. The alloys chosen for this study are nickel-copper, platinum-gold and platinum-copper since they are accessible to FIM study and they also offer various tests of the existing theories.

This research was previously supported by DMR 7815925.

This is the first year of a three-year continuing grant.

8.0029, THEORETICAL STUDIES OF RESONANT SCATTERING IN ATOMIC PHYSICS

J.N. Bardsley, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (PHY79-00957)

Research in theoretical atomic physics initiated under NSF grant PHY76-21456 will be continued. The major emphasis of this research will be on the study of dissociative recombination of electrons with molecular ions. Further calculations on electron scattering by neutral molecules and theoretical analysis of the complex coordinate method are proposed.

This is a new year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0030, ATOMIC PROCESSES IN STRONG ELECTROMAGNETIC FIELDS

J.E. Bayfield, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (PHY79-09031)

The physics of atoms and molecules in strong electromagnetic fields is to be broadly investigated using new, sensitive and flexible techniques based upon highly excited atom and negative ion beams in microwave and infrared laser fields. Particular experiments will include: studies of non-resonant multiphoton transitions to a continuum; studies of resonant multiphoton dissociation of high vibrational states of small molecules; studies of resonant multiphoton ionization of highly excited atoms; and merged atoms-beams experiments on strong-field radiative proton-hydrogen collisions.

This is the first year of a three-year continuing grant.

This research is a continuation of that previously supported under NSF grant PHY76-84186A01.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0031, THEORY OF QUANTUM ELECTRODYNAMIC PROCESSES IN THE FIELD OF AN ATOM

R.H. Pratt, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (PHY78-26491)

Research in theoretical atomic physics initiated under NSF grant PHY7403531A04 will continue. Investigations will emphasize the study of quantum electrodynamic processes in the field of atoms and atomic ions. This includes both the study of specific radiative processes, or processes which combine quantum electrodynamic interactions with nuclear or weak interactions, and general techniques of calculation. Work will continue on bremsstrahlung and pair production (particularly how to compactly characterize data), atomic photo-effect (behavior of dominant radial matrix elements), Rayleigh and Compton scattering, internal conversion and other nuclear transformations. Other studies include atomic environments, an analytic perturbation theory for screened potentials and approximate high-energy wave functions.

1st year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0032, ELECTRONIC PROPERTIES OF LIQUIDS

L.R. Painter, University of Tennessee, Knoxville Campus, School of Liberal Arts, Dept. of Physics, *W. Cumberland Ave. S.W., Knoxville, Tennessee* 37916 (006484)

Techniques have been developed for measuring the electronic structure of condensed materials. This technique consists of measuring the reflectances from the surfaces of solids in the visible and ultraviolet spectral region as a function of the angle of incidence of the light. Such data are analyzed to yield the real and imaginary parts of the dielectric constants, epsilon(1) and epsilon(2), and the energy loss function, -im(1/epsilon). The possibility of utilizing such a technique in the study of the electronic properties of liquids was examined first by the contractor during the years 1966 to 1968 wherein she was able to determine the dielectric response of pure water in the region from 2000 to 1050 Angstroms. Under the present contract a new open-dish windowless reflectometer with movable monochromator was constructed in order to extend the studies on liquid water to shorter wavelength (high energy). Reflectance measurements on water with the new cell have been taken in the spectral region from 1350 to 500 Angstroms and the data analyzed to yield the optical and dielectric constants of the liquid. Similar techniques have been used in the study of two silicon diffusion pump oils, Dow Corning 704 and 705 (tetramethylhetraphenytrisiloxane and trimethylpentaphenytrisiloxane, respectively), two linear hydrocarbons, tetradecane and heptadecane, on glycerol, bovine albumin, and DNA. Similar studies have been made on solutions of fucose, cholesterol and the phospholipid lecithin.

SUPPORTED BY U.S. Dept. of Energy, Office of Health & Environmental Research

8.0033, IONOSPHERIC MODIFICATION EXPERIMENTS AT ARECIBO

W.E. Gordon, Rice University, School of Engineering, Dept. of Electrical Engineering, *6100 Main St., Houston, Texas* 77001 (ATM79-09088)

The ionospheric modification experiments performed at Arecibo have led to significant developments in aeronomy, ionospheric physics and plasma physics. The variety of unexpected phenomena associated with the modification process has stimulated a great deal of theoretical work, especially in the field of nonlinear plasma physics. Of particular importance have been the so-called parametric instabilities which have applications to laser fusion research, and the thermal coupling processes which lead to a striated ionospheric plasma.

Using support provided here Dr. Gordon will mount one major and two follow-up ionospheric modification experiments per year using the current facilities at Arecibo Observatory along with the auxiliary HF facility now under construction and a portable 50 MHz radar positioned on the island of Guadeloupe.

The problems of interest reflect the widening scope of the experimental capabilities at Arecibo. The following areas of research will be studied: 1. Parametric instabilities in the F region, their excitation and suppression. 2. The generation of meter scale field-aligned plasma striations and their relation to plasma instabilities. 3. The interaction of the HF wave with blanketing sporadic E and the implications of these observations on the nature of sporadic E.

The overall aim is to stimulate the ionosphere in order to further our understanding of plasma instabilities.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

8.0034, CHEMIIONIZATION IN COLLISIONS INVOLVING EXCITED RARE GAS ATOMS

R.F. Stebbings, Rice University, School of Natural Sciences, Dept. of Space Physics & Astronomy/Physics, *6100 Main, Houston, Texas* 77001 (C-552)

Absolute rate constants for the ionization of highly excited xenon atoms Xe(nf), with 25 less than or equal to n less than or equal to 41, in collisions with CH3I, C7F14, C6F6 and CH3Br have been measured and the major charged reaction products have been identified for all but CH3Br. Theoretical models view such collisions as being dominated by the interaction between the target molecules and the 'essentially free' Rydberg electrons, and in the case of CH3I, C7F14 and C6F6 the resulting negative ions are indeed similar to those resulting from the attachment of free thermal electrons.

In collisions with NH3 molecules it is observed that the xenon Rydberg atoms are selectively excited to discrete, more highly excited states. These states are identified by the technique of field ionization and are found to be displaced in energy from the initial Rydberg states by amounts equal to the rotational spacings of the NH3 molecule.

The collisions may thus be represented by Xe(nf) plus NH3(J) yields Xe(n'f) plus N3H(J-1) and demonstrate, for the first time, the conversion of rotational to electronic excitation energy in collisions.

8.0037, THERMODYNAMICS AND THERMOELECTRICITY IN RUTILE AND RELATED SYSTEMS
O.W. Johnson, Utah Higher Education System, University of Utah, School of Science, Dept. of Physics, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (DMR79-07802)

The transition metal oxides and related compounds are important due to their high melting temperatures and thermodynamic stability. Quantitative understanding of the properties and behavior of these materials, unfortunately, has lagged far behind that of other materials such as covalent semiconductors or metals. The rutile phase of titanium dioxide is probably the best understood of the transition metal oxides, although much of what has been learned is still rather qualitative. Rutile is, thus, a logical choice as a model system in which to study the characteristic properties of this class of materials. There are also potential technological applications for rutile.

This project is concerned with the thermodynamic parameters necessary to characterize completely lattice defects (oxygen vacancies and titanium interstitials, hydrogen interstitials, and substitutional impurities) in the rutile form of titanium dioxide. This is done by measuring conduction electron concentration at high temperatures in a known ambient controlled by a zirconi electrolytic cell. Thermoelectricity in rutile and similar systems also is investigated with the goals, first, of using the thermoelectric behavior as a probe of other transport properties and, second, of improving the figure of merit of thermoelectric devices. Previous work on this project has contributed, in part, to the development of an electrically conducting rutile ceramic of improved chemical stability.

First year of a two-year continuing grant; renewal of work supported by DMR76-82077.

8.0038, IONOSPHERIC WAVE-PARTICLE EFFECTS
D. Strickland, Science Applications Inc., *8400 Westpark Dr., McLean, Virginia* 22101 (DN980217; N00014-79-C-0197)

To investigate the effects of ionospheric plasma wave-particle interactions on the transport of non-thermal electrons.

Develop plasma physics modules which treat wave-particle interactions and incorporate these modules into NRL's existing numerical code of electron transport and deposition in the ionosphere.

SUPPORTED BY U.S. Dept. of Defense, Navy, Naval Research Lab.

8.0039, ROLE OF DISLOCATIONS IN DYNAMIC FAILURE OF LIF UNDER SHOCK CONDITIONS
G.E. Duvall, Washington State University, School of Arts & Sciences, Dept. of Physics, *Administration Bldg., Room 101, Pullman, Washington* 99163 (DMR79-06122)

The mechanisms of precursor decay in doped and undoped LiF will be studied by propagation of shocks in 100 directions wherein primary (110) slip systems are stressed. In the 100 experiments Mg will be diffused into undoped LiF and the resulting layer hardened by suitable annealing. For 28 kilobar impact, precursor amplitudes will be measured as a function of distance from the boundary between Mg-hardened and undoped LiF. The results will suggest whether or not dislocations are being driven at supersonic velocities in pure LiF and whether or not dislocation break-up is occurring at the high velocities produced by the shock wave.

This research was previously supported under DMR 7708656.

10.0001, INTERSTELLAR MEDIUM STUDIES
B.L. Lutz, Lowell Observatory, *P.O. Box 1269, Flagstaff, Arizona* 86001 (AST7820131)

High-resolution studies of the visible and near-infrared spectra of moderately to heavily reddened early-type stars are proposed as a continuation and extension of a study of interstellar diatomic carbon (C2). The interstellar line spectrum of stars in the dense Cygnus OB2 (VI Cyg) association will be studied as an optical map of the spatial distribution of the consistent atomic and molecular species within the cloud. The studies will be combined with spatial mapping in carbon monoxide 12CO and 13CO radio lines. This cloud, which allows the combination of optical and radio observations, is thought to be a transition between the classical tenuous and dark clouds and represents a rare opportunity to study the interstellar chemistry of a dense optical cloud. Cloud models for this region will be investigated.

Additional observations of Ophiuchi are proposed to determine the kinetic temperature of the cloud through the observation of interstellar C2. Specifically, the 2-O R (O) line will be sought using the PEPSIOS for combination with the Q(2) line observed last season. A similar search for interstellar C2 in the zeta Persei spectrum is also proposed. Both sets of observations are seen as tests of current cosmochemical models of tenuous cloud regions.

Other stars such as HD183143 and BD-plus 66 degrees 1675 are included in the interstellar medium study, and new possible molecules detectable in the infrared are added to the program search list.

10.0002, EVALUATION OF MULTIPLE-MIRROR TELESCOPE ACTIVE OPTICS ALIGNMENT CONTROL SYSTEM
W.F. Hoffmann, University of Arizona, School of Liberal Arts, Dept. of Astronomy, *Tucson, Arizona* 85721 (AST76-20822 A02)

A multiple-mirror telescope on Mount Hopkins, a 8,650 foot mountain south of Tucson, Arizona, is in the final stages of construction. It has been funded by the University of Arizona and the Smithsonian Astrophysical Observatory. It is equivalent to a conventional telescope 4.5 meters in diameter but uses six 1.8 meter diameter mirrors working together. The crucial element is the active optics control system which combines the beams from all six mirrors, continually adjusting each one to maintain optimum alignment.

A three-year program of testing and evaluation of the active optics system will be carried out at the University of Arizona. The performance of the optical system will be critically evaluated. The system will be improved wherever possible. The limiting factors in the telescope mechanics and in the earth's atmosphere will be identified. The results will be analyzed with respect to the application of the multi-mirror approach for the construction of new very large aperture optical and infrared telescopes.

This is a continuation of research previously funded under NSF Grant AST 76-20822.

10.0003, MODERN AND HISTORICAL ANALYSES OF THE SOLAR CONSTANT

R.J. Angione, California State University & Colleges, San Diego State University, School of Sciences, Dept. of Astronomy, *5402 College Ave., San Diego, California* 92115 (ATM77-07987 A01)

This grant will support the continuation of a long-term program of analysis of data on variations in atmospheric constituents and the solar spectral energy output during the period 1902 to 1960, combined with modern ground-based observations.

Half of the effort will be devoted to accurate determination of the solar constant and spectral energy distribution using modern techniques of analysis on published results and archival data from the Smithsonian Institution's Solar Constant Observing Program. This program was operated for more than 50 years under the direction of Dr. C. G. Abbot, and is unparalleled among photometric programs in terms of accuracy and time-length of baseline. Analysis of these data represents a way of recovering accurate, quantitative information on variations in the solar energy output over long-term scales.

The second half of the effort will be devoted to the establishment and operation of a state-of-the-art solar constant observing station at Mt. Laguna Observatory in Southern California. This station will incorporate all of the methods proven useful in over fifty years of Smithsonian observations, as well as modern technical advances to provide highly accurate contemporary benchmark values for variations in atmospheric constituents and the solar constant. Experience gathered in the operation of this station will be used in interpretation of the Smithsonian data. Long-term operation of the station is planned in a manner that will keep the need for long-term support at an absolute minimum.

10.0004, RESEARCH WITH PHOTON-COUNTING SPECTROMETER SYSTEMS AT THE HALE OBSERVATORIES

S.A. Shectman, Hale Observatories, *813 Santa Barbara ST., Pasadena, California* 91101 (AST79-11332)

The Cassegrian spectrograph of the Las Campanas Observatory 2.5-meter duPont telescope has been equipped with a photon-counting, intensifier diode array detector system. A similar system, developed as a prototype, is in use at the Mt. Wilson 2.5-meter telescope and the Palomar 5-meter telescope. These instruments are being used for a wide variety of observational projects.

This grant will provide for technical support of these instruments. There will be development of improved facilities for data reduction. The resolution and dynamic range of this detector will be improved.

10.0005, THEORETICAL STUDIES OF PLANETARY ATMOSPHERES

G.E. Thomas, University of Colorado, Boulder Campus, Lab. for Atmospheric & Space Physics, *1200 University Ave., Boulder, Colorado* 80302 (ATM76-23812 A02)

This grant funds a study of the radiative processes which determine the thermal structure of the middle atmospheres of the planets, particularly the stratosphere and mesosphere of Earth. The initial emphasis will be on developing general theoretical methods for calculating the time-dependent properties of temperature and density, as they are affected by changing solar ultraviolet heating, or by impulsive or harmonic disturbances due to dynamical processes. Specific applications will be made to the diurnal temperature variation of the middle atmosphere, to the coupling of photochemistry to radiation, and to the effects of non-LTE on the thermal emission. In addition, this grant funds a study of the structure of the outer hydrogen exosphere of Earth and the planets. This will be achieved both by analysis of satellite measurements and through a dynamical theory of the interaction of the exosphere with solar radiation. It is planned to conduct a detailed study of the behavior of atomic hydrogen in the upper thermosphere during a geomagnetic storm, from an analysis of Lyman alpha airglow data and from a dynamical theory of a time-dependent exosphere.

10.0006, HOT STARS WITH EXPANDING ATMOSPHERES

D.G. Hummer, University of Colorado, Boulder Campus, School of Arts & Sciences, Dept. of Physics & Astrophysics, *1200 University Ave., Boulder, Colorado* 80302 (AST77-23183)

Support is for studies concerned with the outer atmospheres and stellar winds of very hot and luminous stars, such as those of type Of, nuclei of planetary nebulae and Wolf-Rayet stars. Individual areas of research include stellar wind and line formation theory arising from stellar rotation, stellar wind models for absolute instability to investigate possible heating mechanisms for the wind, and the current discrepancies between theoretical and observational results on the temperature and ionization state of the wind. In the course of these investigations, excitation equilibrium calculations for He II, N III, C III-IV, and O VI will be carried out using a powerful multi-level, spherical geometry, expanding-atmosphere code that has been developed at the University of Colorado.

Prior support was by NSF Grant AST 76-22032.

10.0007, SPECTROSCOPIC STUDIES RELATING TO PROBLEMS IN STELLAR EVOLUTION THEORY AND EARLY CHEMICAL EVOLUTION

D. Butler, Yale University, Graduate School, Dept. of Astronomy, *206 Elm, New Haven, Connecticut* 06520 (AST79-10009)

This research will be concerned with the study of a class of very old intrinsic variables known as BL Herculis stars. The stars vary on time scales of one to three days, and exist in globular clusters of the galaxy, in dwarf spheroidal galaxies and in the Small Magellanic Cloud. Very little is known, however, about the BL Herculis stars in the general galactic field. Such stars will be studied via the techniques of intermediate-band photoelectric photometry. Stellar atmospheric parameters such as surface gravity, temperature and chemical composition will be determined for these stars.

There will be studies of the chemical abundances of RR Lyrae stars in the Magellanic Clouds, and there will be a low-resolution spectroscopic study of giant and subgiant stars in the globular clusters NGC6397.

10.0009, NATURE OF SHORT-PERIOD BINARY STARS FROM AN OBSERVATIONAL VIEWPOINT

R.E. Wilson, State University System of Florida, University of South Florida, School of Natural Sciences, Dept. of Astronomy, *4202 Fowler Ave., Tampa, Florida* 33620 (AST77-09188)

Fundamental data will be extracted from existing light curves of contact and other short-period binary stars as a test of theories of the structure and evolution of these binaries and a stimulus to new theoretical ideas. Large numbers of such systems need analysis to permit meaningful statistical studies of their properties. The work will include W UMa-type and other contact binaries, also 'short-period Algol', and 'short-period Beta Lyrae' type systems, so far almost completely neglected except for gathering of observations. This basic ground-work should lead to a better understanding of the nature of these latter type systems from an evolutionary point of view. The light curve and differential corrections programs developed by the investigators will be further improved, and the latest versions made available to workers in the field.

10.0011, RESEARCH IN RADIO ASTRONOMY

G.W. Swenson, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Electrical Engineering, *207 Engineering Hall, Urbana, Illinois* 61801 (AST79-01690)

Research using the method of Very Long Baseline Interferometry (VLBI) to observe radio astronomical sources, including fully-automated VLBI station operation, will be carried out. The participation of the Vermillion River Observatory (VRO) in the VLBI network will continue providing a badly-needed midwestern station to the interim network of existing telescopes. It is intended to equip the 120-foot telescope for operation at six centimeters wavelength.

The 18 cm continuum flux monitoring program, which has been under way since 1973, will be continued for about 30 sources which show significant variations at this wavelength plus a score or so more which might be expected to show variations. In addition a systematic monitoring program will be instituted for the 18 cm fluxes ascribable to the small-diameter components of a large number of sources, using VLBI between the VRO telescope and the National Radio Astronomy Observatory 300-foot telescope.

The principal funding is from the University of Illinois, which supports the VRO and most of the salaries of the Principal Investigator and his doctoral-level colleagues. This is a continuation of AST-7700440AO1.

10.0012, RADIO OBSERVATIONS OF INTERSTELLAR CLOUDS, CIRCUMSTELLAR SHELLS, AND COMETS

L.E. Snyder, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Astronomy, *Urbana, Illinois* 61801 (AST79-07830)

The research in this project is concerned with molecules in astronomical objects. Maser emission from silicon oxide (SiO) and hydroxyl radical (OH) molecules originating in shells of material surrounding stars will be studied to learn more about the physics of the maser pumping processes and to measure the sizes of these circumstellar shells. The SiO maser in the Orion region remains enigmatic and this research should cast light on its nature.

Observational searches for certain large molecules, including glycine, will be carried out in various regions of the interstellar medium. The positive detection of glycine, the simplest of the amino acids, will have strong implications for theories of the origins of life on the Earth and elsewhere in the universe. Observations of molecules containing deuterium, the isotope of hydrogen of mass 2, will enhance understanding of interstellar abundance ratios, chemical fractionation, and partial ionization. The observations will also enhance understanding of the fundamental molecular constants. Radio observations of molecules in comets will be made in order to advance the currently limited understanding of cometary chemistry. The ultimate goal of this research is to understand galactic chemical evolution and its role in the various stages of star formation. The observations will be made with three different radio telescopes, the 36 foot and 140 foot of the National Radio Astronomy Observation and the University of Illinois' Vermillion River Observatory's 120 foot dish.

This is a continuation of AST-7701345AO1.

10.0014, OBSERVATIONS OF DISTANT CLUSTERS AND CENTRAL REGION OF OUR GALAXY

K.A. Janes, Boston University, School of Arts & Sciences, Dept. of Astronomy, *881 Commonwealth Ave., Boston, Massachusetts* 02215 (AST78-25535)

It has not been possible until recently to say, even approximately, how our galaxy was formed or how it has evolved. However, in the past two or three years some rather detailed theoretical descriptions of the formation and evolution of the galaxy have been published, making specific comparisons with observation possible. The dynamics of the galaxy and the general distribution of stars and gas are reasonably well understood and can be compared directly with theory. However, some of the theory makes predictions about the chemical evolution of the galaxy, that is to say the relationship between the chemical compositions of stars and their ages and distribution in the galaxy. We know little about the compositions of stars as a function of age even in the vicinity of the sun and almost nothing about the chemical makeup of stars in distant parts of the Galaxy. The aim of this research project is to study some distant clusters of the galactic disk and to analyze low-resolution spectra of stars in the central region of the galaxy. From these observations it will be possible to learn something about the nature of the stellar population in these distant regions and how the stars there may differ from those in the vicinity of the sun.

10.0016, FLUID MOTION IN THE EARTH'S CORE AND MANTLE

W.V. Malkus, Massachusetts Inst. of Technology, School of Science, Dept. of Mathematics, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (EAR77-12889 A01)

This is a project to explore the consequences of a newly discovered analytical path towards the determination of the non-linear macrodynamics of planetary and solar dynamos. Those general features of dynamo magnetic fields and the concommitant global flows are sought which are insensitive to the details of the energy-supplying small-scale motions. Preferential selection of steady or periodic dipole parity, westward drift of the earth's core fluid, and 'equatorial acceleration' on the sun are all macrodynamic features now accessible to investigation without dependence upon numerical experiment. The new formulation of the macrodynamical dynamos problem is based upon a determination of the Taylor-like constraints on Lorentz forces in the stably-stratified fluid adjacent to the actively generating region. The flows produced in the stably-stratified fluid can be both the finite amplitude signature of the dynamo process and the principal feature determining parity and polarity. Equally important, the axisymmetric form of the initial nonlinear problem so formulated is separable and solvable for many different small-scale forcing functions.

10.0019, OPTICAL SPECTROSCOPY OF THE INTERSTELLAR MEDIUM

W.A. Traub, Smithsonian Institution, Astrophysical Observatory, Optical & Infrared Div, *60 Garden St., Cambridge, Massachusetts* 02138 (310-4050-12)

A spectroscopic search was made for a deuterium emission line in the Orion nebula in order to determine the isotope ratio of deuterium to hydrogen, which is a crucial parameter in cosmological models of the formation of the universe. From our observations, we are able to set an upper limit D/H less than 1.3 times 10 to the minus 4th power; from our earlier detection of deuterium on Jupiter, we expect that a factor of 10 further improvement will be needed for a measurement in Orion. The presence of a previously undetected high-velocity cloud with an H alpha emission feature which partially overlaps the expected D alpha position is the only impediment to a more accurate determination.

Analysis of our earlier observations of the CN absorption band 3874 A was completed, resulting in a determination of the cosmic background radiation temperature (at 1.32 mm) of about 2.9 degrees K.

10.0020, THEORETICAL ASTROPHYSICS - THE PHYSICS OF DENSE STELLAR SYSTEMS

J.G. Hills, Michigan State University, School of Natural Sciences, Dept. of Astronomy & Astrophysics, *243 Natural Resources Bldg., East Lansing, Michigan* 48824 (AST78-21454)

A research program primarily concerned with the dynamics of dense stellar systems (galactic nuclei and the cores of globular clusters) will be carried out. In particular, a quasi-stellar object (OSO or quasar) model in which the tremendous energy produced is provided by the tidal breakup of stars and the subsequent capture of their debris by large black holes in the galactic nuclei will be investigated. There is recent observational evidence that there is a large black hole in one of the large well-known galaxies. Research in the physics of other dense physical systems will also be done.

10.0023, OBSERVATIONS OF EMISSION-LINE GALAXIES AND QUASARS

D.W. Weedman, Pennsylvania State University, University Park Campus, School of Science, Dept. of Astronomy, *211 Whitmore Lab., University Park, Pennsylvania* 16802 (AST79-01067)

Large numbers of emission-line galaxies have been discovered in surveys during the past decade, primarily by Markarian with the Byurakan (USSR) Schmidt telescope and by various observers with the Tololo (Chile) Schmidt. These galaxies need further study because the source of radiation energizing the gas which produces the emission lines is not understood. In many cases, this source seems related to that in the quasars. Consequently, extensive studies of both emission-line galaxies and quasars are proposed to investigate the energy source. For quasars much study will also be directed toward determining their distribution in the universe. The optical observations will be done with telescopes at the Black Moshannon Observatory of the Pennsylvania State University as well as the national observatories. Quasars will also be studied with the Very Large Array radio telescope.

10.0024, THE CONSTRUCTION OF NEW ASTROMETRIC INSTRUMENTATIONS FOR THE DETECTION OF EXTRASOLAR PLANETARY SYSTEMS

G.D. Gatewood, University of Pittsburgh, School of Arts & Sciences, Dept. of Physics & Astronomy, *4200 5th Ave., Pittsburgh, Pennsylvania* 15260 (AST79-09181)

Astrometric instrumentation combining photon counting techniques with those of precision interferometric spacing and minicomputer technology has been designed and built at the Allegheny Observatory. Tests with the Allegheny 76-cm Thaw photographic refractor indicate that the new detector may be expanded into a system capable of rivaling the astrometric precision projected for the Space Telescope and the European Space Agency's HIPPARCOS satellite. Precision is tripled and stars

ten times fainter can be reached. These tests show that most of the existing long focus astrometric telescopes could, with careful modeling, obtain precisions of 2 or 3 mas (1 mas equals 1 milliarcsec equals 0.001 arcsec) per object per night. This precision combined with the ability to routinely measure 15th-magnitude and fainter reference stars would give astrometrists the ability to determine precise parallaxes at stellar distances greater than 100 parsecs and to survey nearly 100 neighboring stars for evidence of Jupiter-like planets. The Multichannel Astrometric Photometer (MAP) will be improved and parallax observations will be undertaken.

10.0025, OBSERVATION OF LUNAR OCCULTATIONS AND OTHER MUTUAL PHENOMENA

D.S. Evans, University of Texas, Austin Campus, School of Arts & Sciences, Dept. of Astronomy, *200 W. 21st, Austin, Texas* 78712 (AST77-12216 A02)

Several telescopes of the McDonald Observatory in west Texas will be used with photoelectric photometers for recording observations of lunar occultations-eclipses of stars by the moon. The fast response time of the photometer as the moon moves past the star has the effect of producing an angular resolution even smaller than the diffraction limit of the telescope ued for direct observation. The position of the moon's edge is determined very accurately for orbital correction, double stars are frequently discovered, whose angular separations are too small for direct observation. In favorable cases stellar diameters can be determined. In the rare events when a star is occulted by a planet or asteroid, information about the planet's atmosphere and size, or the position and size of the asteroid are obtained. For occultations by these solar system objects portable equipment will be taken to the site where the event is predicted to occur. Observations in various wavelength ranges of the spectrum with more than one telescope will increase the astrophysical value of the information obtained.

Prior support was by NSF grant AST 77-12216.

10.0026, RAPID OPTICAL VARIATIONS FROM COMPACT STARS

R.E. Nather, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (AST79-06340)

This grant will provide support for observational studies of rapid optical variations of compact stars: white dwarf stars, neutron stars, and black holes. The work will concentrate primarily on the rapid variations associated with white dwarf stars, both the single white dwarfs and those in cataclysmic variables (the novae and related stars). The single white dwarf stars show variations in their luminosity because they are pulsating stars. Studies of these stars will include searching for new variable stars and measuring accurate periods and period changes of the pulsations. There will be studies of the rapid coherent oscillations of the white dwarf stars in the cataclysmic variables. There will be studies of the rapid flickering and quasi-periodic oscillations from the disk of material (accretion disk) surrounding the white dwarf. There will be measurements of the orbital radial velocity curves of these close binary systems, and there will be measurements of the profiles and changes in the profiles of the spectral emission lines coming from the accretion disk.

10.0027, IRREGULAR SATELLITES AND CERTAIN UNUSUAL NON-TROJAN ASTEROIDS

R.W. Shorthill, Utah Higher Education System, University of Utah, School of Science, Geospace Sciences Laboratory, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (AST78-24847)

The planned research will help determine the surface mineralogy of the faint irregular satellites of Jupiter and Saturn and selected asteroids, and distinguish among proposed theories of their origin. Progress on both mineralogy and origin is presently hampered by an extreme lack of observational data. The outer Jovian satellites form two groups at different Joviocentric distance parameters. Questions of origin also apply to the irregular Saturnian satellites Hyperion and Phoebe. The measurement of the visible and near-infrared reflectance spectra of solid planetary surfaces is the most useful means of remotely determining their mineralogy and petrology. To determine the mineralogy and petrology of the satellite surface, one needs the maximum spectral coverage and resolution permitted by the available flux. Measurement of asteroidal spectral reflectances at 1.25, 1.6, and 2.2 mu will more than double the spectral range over which asteroids may be compared with laboratory measurements of meteorite samples. Broadband photometry is suitable for the determination of near-infrared asteroid spectral reflectances. Standard broad-band astronomical filters and standard stars will be used, employing large reflecting telescopes. These observations will be made of the irregular satellites and main belt asteroids of unusual color and non-main belt asteroids of unusual orbits.

10.0028, THE EVOLUTION OF STRUCTURE IN THE UNIVERSE

P.E. Boynton, University of Washington, School of Arts & Sciences, Dept. of Astronomy, *Seattle, Washington* 98105 (INT78-08774)

This award supports basic research in observational studies of the evolution of the structure of the Universe. The project is conducted by the Department of Astronomy, University of Washington; and the Research Institute for Electromagnetic Waves of the Department of Physics, University of Rome; and takes place under the Cooperative Science Programs jointly sponsored by the National Science Foundation and the Italian National Council for Research.

The project's objective is to test a ground-based program of FAR infrared observations to detect and measure the mass-density fluctuations in the early Universe (Z approximately equal to 1000). The investigators will examine small angular scales (one to three minutes of arc) in the relict radiation by a technique based on state-of-the-art technology. The data are expected to clarify our knowledge about the inhomogeneity of the mass present in the primordial Universe, and thereby elucidate the question of the so-called 'missing mass', the difference between the observable mass in the present Universe and the mass that would have had to be present at the primordial explosion that created the structure of the Universe. The measurements in question would provide a fundamental test for a whole class of theories concerning the evolution of the Universe. Also, the detection of very distant clusters of galaxies may result from the observational program, as well as a better understanding of the characteristics of the earth's atmosphere.

VISCOUS-INVISCID INTERACTIONS IN LAMINAR FLOWS NEAR SEPARATION REGIONS AND CORNERS Ph.D. Thesis
Jose Carlos Albano do Amarante 1979 142 p
Avail: Univ. Microfilms Order No. 8001872

The implications of the viscous inviscid interactions close to a separated region resulting in regular integration of the two dimensional boundary layer equations are discussed. An inverse boundary layer method is developed where the interactions are represented by prescribing a displacement thickness profile. It is based on a vorticity-stream function formulation with similarity variables which are very convenient since the required transition from a standard approach to an inverse approach is made smoothly and without difficulties. The method is then applied to study an axially symmetric three dimensional separation. Dissert. Abstr.

HC A10/MF A01 CSCL 01A

The use of a computer code for the calculation of steady, supersonic, three dimensional, inviscid flow over blunt bodies is illustrated. Input and output are given and explained for two cases: a pointed code of 20 deg half angle at 15 deg angle of attack in a free stream with M sub infinite = 7, and a cone-ogive-cylinder at 10 deg angle of attack with M sub infinite = 2.86. A source listing of the computer code is provided. Author

The use of a computer code for the calculation of two dimensional inlet flow fields in a supersonic free stream and a nonorthogonal mesh-generation code are illustrated by specific examples. Input, output, and program operation and use are given and explained for the case of supercritical inlet operation at a subdesign Mach number (M Mach free stream = 2.09) for an isentropic-compression, drooped-cowl inlet. Source listings of the computer codes are also provided. Author
